VERITAS

# BUREAU VERITAS RULES FOR THE CLASSIFICATION OF STEEL SHIPS

## NR467 - JANUARY 2024

---

This document contains the consolidated January 2024 edition, Part A to Part F.

This document is for documentation only.

The PDF electronic version of this document available at the Bureau Veritas Marine & Offshore website <https://marine-offshore.bureauveritas.com/> is the official version and shall prevail if there are any inconsistencies between the PDF version and any other available version.

These rules are provided within the scope of the Bureau Veritas Marine & Offshore General Conditions, enclosed at the end of Part A of NR467, Rules for the Classification of Steel Ships. The current version of these General Conditions is available at the Bureau Veritas Marine & Offshore website.

# RULES FOR THE CLASSIFICATION OF STEEL SHIPS

## **Part A** **Classification and Surveys**

---

Chapter 1	Principles of Classification and Class Notations
Chapter 2	Assignment, Maintenance, Suspension and Withdrawal of Class
Chapter 3	Scope of Surveys (All Ships)
Chapter 4	Scope of Surveys in Respect of the Different Services of Ships
Chapter 5	Scope of Surveys Related to Additional Class Notations
Chapter 6	Retroactive Requirements for Existing Ships

## Chapter 1 Principles of Classification and Class Notations

### Section 1 General Principles of Classification

<b>1</b>	<b>Principles of classification</b>	<b>25</b>
1.1	Purpose of the Rules	
1.2	General definitions	
1.3	Meaning of classification, scope and limits	
1.4	Request for services	
1.5	Register of ships	
<b>2</b>	<b>Rules</b>	<b>27</b>
2.1	Effective date	
2.2	Equivalence	
2.3	Novel features	
2.4	Disagreement and appeal	
<b>3</b>	<b>Duties of the Interested Parties</b>	<b>27</b>
3.1	International and national regulations	
3.2	Surveyor's intervention	
3.3	Operation and maintenance of ships	
3.4	Flag and Port State Control inspections	
3.5	Use of measuring equipment and of service suppliers	
3.6	Spare parts	
3.7	Quality system audits	
<b>4</b>	<b>Application of statutory requirements by the Society</b>	<b>29</b>
4.1	International and national regulations	

### Section 2 Classification Notations

<b>1</b>	<b>General</b>	<b>30</b>
1.1	Purpose of the classification notations	
1.2	Types of notations assigned	
<b>2</b>	<b>Class symbol</b>	<b>30</b>
2.1	General	
<b>3</b>	<b>Construction marks</b>	<b>31</b>
3.1	General	
3.2	List of construction marks	
<b>4</b>	<b>Service notations and corresponding additional service features</b>	<b>31</b>
4.1	General	
4.2	Cargo ships	
4.3	Bulk, ore and combination carriers	
4.4	Ships carrying liquid cargo in bulk	
4.5	Ships carrying passengers	
4.6	High speed crafts (HSC)	
4.7	Offshore patrol vessels	
4.8	Fishing vessels	
4.9	Icebreaker ships	
4.10	Tugs	
4.11	Working ships	
4.12	Offshore service vessels	
4.13	Ships for dredging activities	
4.14	Barge and pontoon	
4.15	Miscellaneous units	
4.16	Miscellaneous service features	

# Table of Content

<b>5</b>	<b>Navigation and operating area notations</b>	<b>56</b>
5.1	Navigation notations	
5.2	List of navigation notations	
5.3	Operating area notations	
<b>6</b>	<b>Additional class notations</b>	<b>59</b>
6.1	General	
6.2	VeriSTAR and STAR notations	
6.3	Availability of machinery (AVM)	
6.4	Automated machinery systems (AUT)	
6.5	Integrated and digital systems	
6.6	Monitoring equipment	
6.7	Comfort on board ships and habitability	
6.8	Environmental protection	
6.9	Refrigerating installations	
6.10	Navigation in cold environment	
6.11	Navigation in polar waters	
6.12	Lifting appliances	
6.13	Emergency response service (ERS)	
6.14	Protection against chemical, biological, radiological or nuclear risks	
6.15	Manoeuvring, mooring, anchoring and position keeping	
6.16	Cargo operation, securing and safety	
6.17	Additional notations for stability	
6.18	Additional notations for hull structure assessment	
6.19	Additional notations for fire protection	
6.20	Electric propulsion or electric power supply	
6.21	Cyber security	
6.22	Sustainable ships	
6.23	Smart systems (SMART)	
6.24	Corrosion protection	
6.25	Other additional class notations	
6.26	System fitted but not required by the rules	
<b>7</b>	<b>Other notations</b>	<b>85</b>
7.1		
<b>8</b>	<b>Diving systems</b>	<b>86</b>
8.1	General	
<b>Appendix 1</b>	<b>Notations Assigned According to Editions of the Rules Former to June 2000 Edition</b>	
<b>1</b>	<b>Application for surveys and correspondence with current notations</b>	<b>87</b>
1.1	General	
1.2	Phasing out from former to current notations	
1.3	Application of scope of surveys	
1.4	Correspondence between former and current notations	

## Chapter 2 Assignment, Maintenance, Suspension and Withdrawal of Class

### Section 1 Assignment of Class

<b>1</b>	<b>General</b>	<b>92</b>
1.1		
<b>2</b>	<b>New building procedure</b>	<b>92</b>
2.1	Ships surveyed by the Society during construction	
2.2	Other cases	
2.3	Documentation	

# Table of Content

	<b>3</b>	<b>Ships classed after construction</b>	<b>93</b>
	3.1	General	
	3.2	Ships classed with a Classification Society subject to compliance with QSCS, reported as compliant by the Losing Society	
	3.3	Non-compliant ships	
	<b>4</b>	<b>Date of initial classification</b>	<b>97</b>
	4.1	Definitions	
	<b>5</b>	<b>Reassignment of class</b>	<b>97</b>
	5.1		
<b>Section 2</b>	<b>Maintenance of Class</b>		
	<b>1</b>	<b>General principles of surveys</b>	<b>98</b>
	1.1	Survey types	
	1.2	Change of periodicity, postponement or advance of surveys	
	1.3	Extension of scope of survey	
	1.4	General procedure of survey	
	1.5	Appointment of another Surveyor	
	1.6	Alterations or additions to approved systems	
	<b>2</b>	<b>Definitions and procedures related to surveys</b>	<b>100</b>
	2.1	General	
	2.2	Terminology related to hull survey	
	2.3	Procedures for thickness measurements	
	2.4	Agreement of firms for in-water survey	
	2.5	Preparations and conditions for surveys	
	2.6	Access to structures	
	2.7	Equipment for surveys	
	2.8	Rescue and emergency response equipment	
	2.9	Surveys at sea and anchorage	
	2.10	Repairs and maintenance during voyage	
	2.11	Repairs	
	2.12	Remote Inspection Techniques (RIT)	
	2.13	Remote survey	
	<b>3</b>	<b>Certificate of Classification: issue, validity, endorsement and renewal</b>	<b>107</b>
	3.1	Issue of Certificate of Classification	
	3.2	Validity of Certificate of Classification, maintenance of class	
	3.3	Endorsement of Certificate of Classification	
	3.4	Status of surveys and conditions of class	
	<b>4</b>	<b>Class renewal survey</b>	<b>107</b>
	4.1	General principles	
	4.2	Normal survey system (SS)	
	4.3	Continuous survey system (CS)	
	4.4	Planned maintenance survey system for machinery (PMS)	
	<b>5</b>	<b>Other periodical surveys</b>	<b>109</b>
	5.1	General	
	5.2	Annual surveys	
	5.3	Intermediate surveys	
	5.4	Bottom survey	
	5.5	Tailshaft survey	
	5.6	Boiler survey	
	5.7	Links between anniversary dates and annual surveys, intermediate surveys and class renewal surveys	
	<b>6</b>	<b>Occasional surveys</b>	<b>113</b>
	6.1	General	
	6.2	Damage and repair surveys	
	6.3	Port State Control survey	

# Table of Content

	6.4	Conversions, alterations and repairs	
	6.5	Quality System audits	
	6.6	Unscheduled surveys	
<b>7</b>		<b>Change of ownership</b>	<b>114</b>
	7.1		
<b>8</b>		<b>Lay-up and re-commissioning</b>	<b>114</b>
	8.1	General principles	
<b>9</b>		<b>Safety Management System</b>	<b>115</b>
	9.1		
<b>Section 3</b>		<b>Suspension and Withdrawal of Class</b>	
<b>1</b>		<b>General</b>	<b>116</b>
	1.1	Discontinuance of class	
	1.2	Suspension of class	
	1.3	Withdrawal of class	
	1.4	Suspension/withdrawal of additional class notations	
<b>Appendix 1</b>		<b>Planned Maintenance Survey System</b>	
<b>1</b>		<b>General</b>	<b>118</b>
	1.1		
<b>2</b>		<b>Conditions and procedures for the review of the system</b>	<b>118</b>
	2.1	General	
	2.2	Documentation	
	2.3	Information on board	
	2.4	List of items	
<b>3</b>		<b>Implementation of the system</b>	<b>119</b>
	3.1		
<b>4</b>		<b>Retention and withdrawal of the system</b>	<b>119</b>
	4.1		
<b>5</b>		<b>Surveys</b>	<b>119</b>
	5.1	Implementation survey	
	5.2	Annual audit and confirmatory surveys	
	5.3	Damage and repairs	
<b>Appendix 2</b>		<b>CSM and PMS Systems: Surveys Carried out by the Chief Engineer</b>	
<b>1</b>		<b>Conditions</b>	<b>121</b>
	1.1		
<b>2</b>		<b>Limits of the interventions</b>	<b>121</b>
	2.1		
<b>3</b>		<b>Procedure for carrying out surveys</b>	<b>121</b>
	3.1	General	
	3.2	Main diesel engines	
	3.3	Auxiliary diesel engines	
	3.4	Reciprocating compressors	
	3.5	Coolers, condensers, heaters	
	3.6	Electrical switchboard	
	3.7	a.c. and d.c. generators	
	3.8	Other items (pumps, electric motors, etc.)	
<b>4</b>		<b>Records of surveys carried out</b>	<b>122</b>
	4.1		
<b>5</b>		<b>Confirmatory survey</b>	<b>123</b>
	5.1		

# Table of Content

	6	Suspension of the Chief Engineer's authorization	123
	6.1		
Appendix 3		<b>Thickness Measurements: Extent, Determination of Locations, Acceptance Criteria</b>	
	1	<b>General</b>	124
	1.1	Aim of the Appendix	
	1.2	Scope of the Appendix	
	2	<b>Rule requirements for the extent of measurements</b>	124
	2.1	General	
	2.2	Class renewal survey: all ships except those submitted to ESP or equivalent	
	2.3	Class renewal survey: ships submitted to ESP or equivalent	
	3	<b>Number and locations of measurements</b>	126
	3.1	General	
	3.2	Locations of points	
	4	<b>Acceptance criteria for thickness measurements</b>	138
	4.1	General	
	4.2	Criteria	
	4.3	Local and global strength criteria based on percentage of acceptable wastage	
	4.4	Buckling strength criterion	
	4.5	Acceptance criteria based on net scantling approach	
	4.6	Pitting	
	4.7	Acceptance criteria for CSR ships	
	4.8	Hull supporting structure of shipboard fittings associated with towing and mooring	
	4.9	Ice strengthened structures for ships assigned with additional class notation for navigation in polar waters	
Appendix 4		<b>Condition Monitoring and Condition Based Maintenance</b>	
	1	<b>General</b>	152
	1.1	Application	
	1.2	Definitions	
	1.3	Condition monitoring (CM)	
	1.4	Condition based maintenance (CBM)	
	2	<b>Procedures and conditions for approval of CM and CBM</b>	153
	2.1	Onboard responsibility	
	2.2	Equipment and systems requirements	
	2.3	Documentation and information	
	2.4	Approval validity	
	3	<b>Surveys</b>	154
	3.1	Installation survey	
	3.2	Implementation survey	
	3.3	Annual audit	
	3.4	Damage and repairs	
Appendix 5		<b>Remote Classification Surveys</b>	
	1	<b>General</b>	156
	1.1	Scope	
	1.2	Application	
	1.3	Definitions	
	2	<b>Requirements for equivalency</b>	156
	2.1	General	
	2.2	Eligibility of the remote survey	
	2.3	Planning of the remote survey	
	2.4	Performance of the remote survey	
	2.5	Assessment of the remote survey	

# Table of Content

<b>3</b>	<b>Scope and procedures</b>	<b>157</b>
3.1	Scope - eligible survey items	
3.2	Procedures	
3.3	Hardware and ICT solution	
3.4	Requirements for connectivity	
<b>4</b>	<b>Information and Communication Technology (ICT)</b>	<b>159</b>
4.1	General	
4.2	Hardware	
4.3	Internet connectivity (coverage and speed)	
4.4	Software and data security	
<b>5</b>	<b>Recording of evidence and reporting of survey</b>	<b>160</b>
5.1	Recording of evidence	
5.2	Reporting of remote survey	

---

## Chapter 3 Scope of Surveys (All Ships)

### Section 1 Annual Survey

<b>1</b>	<b>General</b>	<b>163</b>
1.1		
<b>2</b>	<b>Hull</b>	<b>163</b>
2.1	Hull and hull equipment	
2.2	Survey of watertight cable transits	
2.3	Hatch covers and coamings	
<b>3</b>	<b>Machinery and systems</b>	<b>165</b>
3.1	General machinery installations	
3.2	Boilers	
3.3	Electrical machinery and equipment	
3.4	Fire protection, detection and extinction	
3.5	General emergency alarm system	

### Section 2 Intermediate Survey

<b>1</b>	<b>General</b>	<b>170</b>
1.1		
<b>2</b>	<b>Hull</b>	<b>170</b>
2.1		

### Section 3 Class Renewal Survey

<b>1</b>	<b>General</b>	<b>172</b>
1.1		
<b>2</b>	<b>Hull and hull equipment</b>	<b>172</b>
2.1	Bottom survey in dry condition	
2.2	Decks, hatch covers and equipment	
2.3	Survey of watertight cable transits	
2.4	Holds and other dry compartments	
2.5	Tanks	
2.6	Thickness measurements	
2.7	Independent cargo tanks	
<b>3</b>	<b>Machinery and systems</b>	<b>176</b>
3.1	General	
3.2	Main and auxiliary engines and turbines	
3.3	Reduction gears, main thrust and intermediate shaft(s)	
3.4	Pumps and other machinery items	

# Table of Content

	3.5	Systems in machinery spaces	
	3.6	Electrical equipment and installations	
	3.7	Controls	
	3.8	Fire protection, detection and extinction	
	3.9	Hold, ballast and dry spaces water level detectors	
	3.10	Availability of pumping systems	
<b>Section 4</b>	<b>Bottom Survey</b>		
	1	General	182
		1.1	
	2	Bottom survey in dry condition	182
		2.1	General requirements
		2.2	Bottom survey held within the scope of class renewal survey
	3	Bottom in-water survey	182
		3.1	General
<b>Section 5</b>	<b>Tailshaft Survey</b>		
	1	Survey of tailshafts	184
		1.1	General
		1.2	Complete survey
		1.3	Modified survey
	2	Periodical survey of other propulsion systems	185
		2.1	Rotating and azimuth thrusters
		2.2	Vertical axis propellers
		2.3	Pump jet systems
		2.4	Pod propulsion systems
	3	Survey of propeller shafts and tube shafts	186
		3.1	General
		3.2	Oil lubricated shafts or closed loop system fresh water lubricated shafts (closed system)
		3.3	Water lubricated shafts (open systems)
<b>Section 6</b>	<b>Boiler Survey</b>		
	1	Steam boilers	194
		1.1	
	2	Thermal oil heaters	195
		2.1	
<b>Section 7</b>	<b>Hull Survey for New Construction</b>		
	1	General	196
		1.1	
	2	Documentation to be available for the Surveyor during construction	196
		2.1	
	3	Ship construction file	196
		3.1	Ship Construction File (SCF) for all ships, except those specified in [1.1.3]
		3.2	Ship Construction File (SCF) for ships as specified in [1.1.3]
	4	Newbuilding survey planning	202
		4.1	
	5	Examination and test plan for newbuilding activities	203
		5.1	Applicable to all ships
		5.2	Applicable for ships as specified in [1.1.3]
	6	Design transparency	204
		6.1	Applicable for ships as specified in [1.1.3]

# Table of Content

<b>Section 8</b>	<b>Survey of Watertight Cable Transits</b>	
1	General	205
	1.1 Application	
2	Cable Transit Seal Systems Register	205
	2.1 New construction	
	2.2 Vessel in service	
3	Installation and maintenance of Watertight Cable transits	205
	3.1	
<b>Appendix 1</b>	<b>Class Requirements and Surveys of Laid-up Ships</b>	
1	General	206
	1.1	
2	Safety conditions	206
	2.1	
3	Preservation measures for lay-up and maintenance	207
	3.1 General	
	3.2 Exposed parts of the hull	
	3.3 Internal spaces	
	3.4 Deck fittings	
	3.5 Machinery	
	3.6 Electrical installations	
	3.7 Steering gear	
	3.8 Boilers	
	3.9 Automated installation	
4	Lay-up site and mooring arrangements	210
	4.1 General	
	4.2 Recommendations for the lay-up site	
	4.3 Recommendations for the mooring arrangements	
	4.4 Review of the mooring arrangements	
5	Surveys	211
	5.1 Laying-up survey	
	5.2 Annual lay-up condition survey	
	5.3 Re-commissioning survey	

---

## Chapter 4 Scope of Surveys in Respect of the Different Services of Ships

<b>Section 1</b>	<b>General</b>	
1	General	214
	1.1	
2	Service notations and/or additional service features subject to additional surveys	214
	2.1	
<b>Section 2</b>	<b>Single Skin and Double Skin Bulk Carriers</b>	
1	General	216
	1.1 Application	
	1.2 Documentation on board	
	1.3 Reporting and evaluation of surveys	
	1.4 Conditions for survey	
	1.5 Access to structures	

# Table of Content

<b>2</b>	<b>Annual survey</b>	<b>219</b>
	2.1 General	
	2.2 Hatch covers and coamings, weather decks	
	2.3 Cargo holds	
	2.4 Ballast tanks	
<b>3</b>	<b>Intermediate survey</b>	<b>221</b>
	3.1 Ships 10 years of age or less	
	3.2 Ships between 10 and 15 years of age	
	3.3 Ships over 15 years of age	
<b>4</b>	<b>Class renewal survey</b>	<b>224</b>
	4.1 Survey programme and preparation for survey	
	4.2 Survey planning meeting	
	4.3 Scope of survey	
	4.4 Hatch covers and coamings	
	4.5 Overall and close-up surveys	
	4.6 Thickness measurements	
	4.7 Tank testing	

## Section 3 Oil Tankers and Combination Carriers

<b>1</b>	<b>General</b>	<b>237</b>
	1.1 Application	
	1.2 Documentation on board	
	1.3 Reporting and evaluation of surveys	
	1.4 Conditions for survey	
	1.5 Access to structures	
<b>2</b>	<b>Annual survey - Hull items</b>	<b>239</b>
	2.1 General	
	2.2 Weather decks	
	2.3 Cargo pump rooms and pipe tunnels	
	2.4 Ballast tanks	
	2.5 Emergency towing arrangement	
	2.6 Safe access to tanker bows	
	2.7 Means of access	
	2.8 Coating systems	
<b>3</b>	<b>Annual survey - Cargo machinery items</b>	<b>240</b>
	3.1 Cargo area and cargo pump rooms	
	3.2 Instrumentation and safety devices	
	3.3 Fire-fighting systems in cargo area	
	3.4 Inert gas system	
<b>4</b>	<b>Intermediate survey - Hull items</b>	<b>241</b>
	4.1 General	
	4.2 Ships between 5 and 10 years of age	
	4.3 Ships between 10 and 15 years of age	
	4.4 Ships over 15 years of age	
<b>5</b>	<b>Intermediate survey - Cargo machinery items</b>	<b>242</b>
	5.1 Cargo area and cargo pump rooms	
	5.2 Inert gas system	
<b>6</b>	<b>Class renewal survey - Hull items</b>	<b>243</b>
	6.1 Survey programme and preparation for hull survey	
	6.2 Survey planning meeting	
	6.3 Scope of survey	
	6.4 Overall and close-up surveys	
	6.5 Thickness measurements	
	6.6 Tank testing	
	6.7 Cargo piping, area and pump rooms	
	6.8 Emergency towing arrangement	

# Table of Content

	7	Class renewal survey - Cargo machinery items	253
	7.1	Cargo area and cargo pump rooms	
	7.2	Fire-fighting systems in cargo area	
	7.3	Inert gas system	
<b>Section 4</b>	<b>Section 4</b>	<b>Chemical Tankers</b>	
	1	General	254
	1.1	Application	
	1.2	Documentation on board	
	1.3	Reporting and evaluation of surveys	
	1.4	Conditions for survey	
	1.5	Access to structures	
	2	Annual survey - Hull items	255
	2.1	General	
	2.2	Weather decks	
	2.3	Cargo pump rooms and pipe tunnels	
	2.4	Ballast tanks	
	2.5	Emergency towing arrangement	
	3	Annual survey - Cargo machinery items	256
	3.1	Cargo area and cargo pump rooms	
	3.2	Instrumentation and safety devices	
	3.3	Fire-fighting systems in cargo area	
	3.4	Inert gas system and inert/padding/ drying gas	
	4	Intermediate survey - Hull items	257
	4.1	General	
	4.2	Ships between 5 and 10 years of age	
	4.3	Ships between 10 and 15 years of age	
	4.4	Ships over 15 years of age	
	5	Intermediate survey - Cargo machinery items	258
	5.1	Cargo area and cargo pump rooms	
	5.2	Inert gas system	
	5.3	Personnel protection	
	6	Class renewal survey - Hull items	258
	6.1	Survey program and preparation for survey	
	6.2	Survey planning meeting	
	6.3	Scope of survey	
	6.4	Overall and close-up surveys	
	6.5	Thickness measurements	
	6.6	Tank testing	
	6.7	Cargo piping, cargo pump rooms and cargo tanks	
	6.8	Emergency towing arrangement	
	7	Class renewal survey - Cargo machinery items	267
	7.1	Cargo area and cargo pump rooms	
	7.2	Fire-fighting systems in cargo area	
	7.3	Inert gas system	
	7.4	Personnel protection	
	8	Methanol Bunkering	268
	8.1	Application	
	8.2	General	
	8.3	Annual survey	
	8.4	Class renewal surveys	
<b>Section 5</b>	<b>Section 5</b>	<b>Liquefied Gas Carriers</b>	
	1	General	269
	1.1	Application	

# Table of Content

<b>2</b>	<b>Annual survey - Hull items</b>	<b>269</b>
	2.1 General	
	2.2 Weather decks and suspect areas	
	2.3 Cargo handling rooms and piping	
	2.4 Other arrangements or devices	
	2.5 Ballast tanks	
	2.6 Emergency towing arrangement	
<b>3</b>	<b>Annual survey - Cargo machinery items</b>	<b>271</b>
	3.1 Cargo area and cargo pump rooms	
	3.2 Instrumentation and safety devices	
	3.3 Fire-fighting systems in cargo area	
	3.4 Environmental control for cargo containment systems	
<b>4</b>	<b>Intermediate survey - Hull items</b>	<b>272</b>
	4.1 General	
	4.2 Weather decks, cargo handling rooms and piping	
	4.3 Ballast tanks	
<b>5</b>	<b>Intermediate survey - Cargo machinery items</b>	<b>273</b>
	5.1 General	
	5.2 Cargo area and cargo pump rooms	
	5.3 Instrumentation and safety devices	
	5.4 Inert gas system	
	5.5 Personnel protection	
<b>6</b>	<b>Class renewal survey - Hull items</b>	<b>274</b>
	6.1 Preparation for survey	
	6.2 Survey programme	
	6.3 Scope of survey	
	6.4 Overall and close-up surveys	
	6.5 Thickness measurements	
	6.6 Tank testing	
	6.7 Cargo tank structure	
	6.8 Weather decks, cargo handling rooms and piping	
	6.9 Emergency towing arrangement	
<b>7</b>	<b>Class renewal survey - Cargo machinery items</b>	<b>279</b>
	7.1 Cargo area, cargo pump rooms, cargo compressor rooms

## Classification and Surveys

---

### CHAPTER 1

# PRINCIPLES OF CLASSIFICATION AND CLASS NOTATIONS

---

Section 1	General Principles of Classification
Section 2	Classification Notations
Appendix 1	Notations Assigned According to Editions of the Rules Former to June 2000 Edition

# Section 1 General Principles of Classification

## 1 Principles of classification

### 1.1 Purpose of the Rules

**1.1.1** The Rules published by the Society give the requirements for the assignment and the maintenance of classification for seagoing ships.

Note 1: The general conditions of classification are laid down in the Marine & Offshore General Conditions.

**1.1.2** The application criteria of the different parts of the present Rules are the following:

- Part A - Classification and Surveys applies to all ships.
- Part B - Hull and Stability, Part C - Machinery and Systems, Part D and Part E - Service Notations apply to seagoing ships whose hull is of welded steel construction. Where necessary, the extent of application is more precisely defined in each chapter of these parts of the Rules.
- Part F - Additional Class Notations applies, at the request of the Interested Party, to all ships.

The classification of ships other than those dealt with in the above-mentioned Parts B, C, D, E and F is covered by specific Rules published by the Society.

### 1.1.3 Classification of diving systems

The classification of the diving systems is covered by Rule Note NR610, Rules for the Classification of Diving Systems.

Unless otherwise specified, the provisions of the present Rules apply, "diving system" being to be understood when reference is made to "ship".

In case of discrepancy between the requirements of the present Rules and those of NR610, the latter prevail.

## 1.2 General definitions

**1.2.1** The following general definitions are used in these Rules:

- Society means the Classification Society with which the ship is classed.
- Rules means these Rules for the Classification of Ships and documents issued by the Society serving the same purpose.
- Surveyor means technical staff acting on behalf of the Society to perform tasks in relation to classification and survey duties.
- Survey means an intervention by the Surveyor for assignment or maintenance of class as defined in Part A, Chapter 2, or interventions by the Surveyor within the limits of the tasks delegated by the Administrations.
- Administration means the Government of the State whose flag the ship is entitled to fly or the State under whose authority the ship is operating in the specific case.
- Owner means the Registered Owner or the Disponent Owner or the Manager or any other party having the responsibility to keep the ship seaworthy, having particular regard to the provisions relating to the maintenance of class laid down in Part A, Chapter 2.
- Interested Party means a party, other than the Society, having responsibility for the classification of the ship, such as the Owners of a ship and his representatives, or the Shipbuilder, or the Engine Builder, or the Supplier of parts to be tested.
- Approval means the review by the Society of documents, procedures or other items related to classification, verifying solely their compliance with the relevant Rules requirements, or other referential where requested.
- Essential service is intended to mean a service necessary for a ship to proceed at sea, be steered or manoeuvred, or undertake activities connected with its operation, and for the safety of life, as far as class is concerned.
- Gross tonnage (GT) is the measure of the overall size of a ship as determined in accordance with the provisions of the 1969 International Convention on Tonnage Measurement of Ships. It is expressed as a figure without units.

**1.2.2** Definition of date of "contract for construction":

The date of "contract for construction" of a ship is the date on which the contract to build the ship is signed between the Owner and the Shipbuilder. This date is normally to be declared to the Society by the Interested Party applying for the assignment of class to a new ship. For ships "contracted for construction" on or after 1<sup>st</sup> April 2006, this date and the construction numbers (i.e. hull numbers) of all the ships included in the contract, are to be declared to the Society by the Interested Party applying for the assignment of class to a new ship.

The date of "contract of construction" of a series of ships, including specified optional ships for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the Owner and the Shipbuilder.

For the purpose of this definition, ships built under a single contract for construction are considered a “series of ships” if they are built to the same approved plans for classification purposes. However, ships within a series may have design alterations from the original design provided:

- Such alterations do not affect matters related to classification, or
- If the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective Owner and the Shipbuilder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to the Society for approval.

The optional ships will be considered part of the same series of ships if the option is exercised not later than 1 year after the contract to build the series was signed.

If a contract for construction is later amended to include additional ships or additional options, the date of “contract for construction” for such ships is the date on which the amendment to the contract is signed between the Owner and the Shipbuilder. The amendment to the contract is to be considered as a “new contract” to which the above applies.

If a contract for construction is amended to change the ship type, the date of “contract for construction” of this modified ship or ships, is the date on which the revised contract or new contract is signed between the Owner, or Owners, and the shipbuilder.

### 1.3 Meaning of classification, scope and limits

**1.3.1** The classification process consists of:

- the development of Rules, guidance notes and other documents relevant to the ship, structure, material, equipment, machinery and other items covered by such documents
- the review of plans and calculations and the surveys, checks and tests intended to demonstrate that the ship meets the Rules (refer to Ch 2, Sec 1)
- the assignment of class (see Ch 2, Sec 1) and issue of a Certificate of Classification, where compliance with the above Rules is found
- the periodical, occasional and class renewal surveys performed to record that the ship in service meets the conditions for maintenance of class (see Ch 2, Sec 2).

**1.3.2** The Rules, surveys performed, reports, certificates and other documents issued by the Society, are in no way intended to replace or alleviate the duties and responsibilities of other parties such as Administrations, Designers, Shipbuilders, Manufacturers, Repairers, Suppliers, Contractors or Sub-contractors, actual or prospective Owners or Operators, Charterers, Brokers, Cargo-owners and Underwriters.

The activities of such parties which fall outside the scope of the classification as set out in the Rules, such as design, engineering, manufacturing, operating alternatives, choice of type and power of machinery and equipment, number and qualification of crew or operating personnel, lines of the ship, trim, hull vibrations, spare parts including their number, location and fastening arrangements, life-saving appliances, and maintenance equipment, remain therefore the responsibility of those parties, even if these matters may be given consideration for classification according to the type of ship or additional class notation assigned.

**1.3.3** Unless otherwise specified, the Rules do not deal with structures, pressure vessels, machinery and equipment which are not permanently installed and used solely for operational activities such as dredging or heavy load lifting, workshops or welding equipment, except for their effect on the classification-related matters, as declared by the Interested Party, such as fire protection and ship’s general strength.

During periods of construction, modification or repair, the unit is solely under the responsibility of the builder or the repair yard. As an example, the builder or repair yard is to ensure that the construction, modification or repair activities are compatible with the design strength of the ship and that no permanent deformations are sustained.

Note 1: Refer to [3.3] as regards the Owner’s responsibility for maintenance and operation of the ship in relation to the maintenance of class.

**1.3.4** The class assigned to a ship by the Society following its interventions is embodied in a Certificate of Classification and noted in the Register of ships.

At a certain date the class of a ship is maintained or regular when no surveys are overdue, when the conditions for suspension of class are not met and when the class is not withdrawn nor suspended. Otherwise the class is irregular. Attention is drawn on the fact that a ship holding a valid Certificate of Classification may be in an irregular class position.

### 1.4 Request for services

**1.4.1** Requests for interventions by the Society, such as surveys during construction, surveys of ships in service, tests, etc., are in principle to be submitted in writing and signed by the Interested Party. Such request implies that the applicant will abide by all the relevant requirements of the Rules, including the Marine & Offshore General Conditions.

The Society reserves the right to refuse or withdraw the class of any ship for which any applicable requirement of the Rules is not complied with.

## **1.5 Register of ships**

**1.5.1** A Register of Ships is published periodically by the Society. This publication, which is updated by the Society, contains the names of ships which have received the Certificate of Classification, as well as particulars of the class assigned and information concerning each ship.

## **2 Rules**

### **2.1 Effective date**

**2.1.1** The effective date of entry into force of any amendments to the Rules is indicated on the inside front page of the Rules or in the relevant Section.

**2.1.2** In principle, the applicable Rules for assignment of class to a new ship are those in force at the date of contract for construction.

**2.1.3** Special consideration may be given to applying new or modified rule requirements which entered into force subsequent to the date of contract for construction, at the discretion of the Society and in the following cases:

- when a justified written request is received from the party applying for classification
- when the keel is not yet laid and more than one year has elapsed since the contract for construction was signed
- where it is intended to use existing previously approved plans for a new contract.

**2.1.4** The above procedures for application of the Rules are, in principle, also applicable to existing ships in the case of major conversions and, in the case of alterations, to the altered parts of the ship.

**2.1.5** The rule requirements related to assignment, maintenance and withdrawal of the class of ships already in operation, as detailed in Part A, Chapter 2 to Part A, Chapter 5, are applicable from the date of their entry into force.

### **2.2 Equivalence**

**2.2.1** The Society may consider the acceptance of alternatives to these Rules, provided that they are deemed to be equivalent to the Rules to the satisfaction to the Society.

**2.2.2** If deemed necessary, the Society may require that engineering analysis, assessment and approval of the alternative design and arrangement be carried out in accordance with IMO MSC.1/Circ.1002 as amended, IMO MSC/Circ.1212 as amended and IMO MSC.1/Circ.1455 as amended, as applicable.

### **2.3 Novel features**

**2.3.1** The Society may consider the classification of ships based on or applying novel design principles or features, to which the Rules are not directly applicable, on the basis of experiments, calculations or other supporting information provided to the Society. Specific limitations may then be indicated on a memorandum.

### **2.4 Disagreement and appeal**

**2.4.1** Any technical disagreement with the Surveyor in connection with the performance of his duties should be raised by the Interested Party as soon as possible.

The Interested Party may appeal in writing to the Society, which will subsequently consider the matter and announce its decision according to its established procedure.

## **3 Duties of the Interested Parties**

### **3.1 International and national regulations**

**3.1.1** The classification of a ship does not relieve the Interested Party from compliance with any requirements issued by Administrations.

Note 1: Attention is drawn on the prohibition of asbestos on-board ships (new ships, modified parts of existing ships) and other National Regulations, as applicable.

Note 2: From the 1st January 2023, newly identified asbestos on board by the Society acting as the Recognized Organization for ISM/MLC/IHM is to be reported to the Owner, the Flag Administration and the Recognized Organization classing the vessel and responsible for the main statutory certificates, as per the Society's procedure.

## **3.2 Surveyor's intervention**

**3.2.1** Surveyors are to be given free access at all times to ships which are classed or being classed, shipyards and works, to carry out their interventions within the scope of assignment or maintenance of class, or within the scope of interventions carried out on behalf of Administrations, when so delegated.

Free access is also to be given to auditors accompanying the Surveyors of the Society within the scope of the audits as required in pursuance of the Society's internal Quality System or as required by external organizations.

**3.2.2** Interested Parties are to take the necessary measures for the Surveyors' inspections and testing to be carried out safely. Interested Parties - irrespective of the nature of the service provided by the Surveyors of the Society or others acting on its behalf - assume with respect to such Surveyors all the responsibility of an employer for his workforce such as to meet the provisions of applicable legislation. As a rule, the Surveyor is to be constantly accompanied during surveys by personnel of the Interested Party. Interested Parties are to inform promptly the Surveyor of defects or problems in relation to class.

Refer also to Ch 2, Sec 2, [2.5] to Ch 2, Sec 2, [2.9].

**3.2.3** The Certificate of Classification and/or other documents issued by the Society remain the property of the Society. All certificates and documents necessary to the Surveyor's interventions are to be made available by the Interested Party to the Surveyor on request.

**3.2.4** During the phases of ship design and construction, due consideration should be given to rule requirements in respect of all necessary arrangements for access to spaces and structures with a view to carrying out class surveys. Arrangements of a special nature are to be brought to the attention of the Society.

## **3.3 Operation and maintenance of ships**

**3.3.1** The classification of a ship is based on the understanding that the ship is loaded and operated in a proper manner by competent and qualified crew or operating personnel according to the environmental, loading, operating and other criteria on which classification is based.

In particular, it will be assumed that the draught of the ship in operating conditions will not exceed that corresponding to the freeboard assigned or the maximum approved for the classification, that the ship will be properly loaded taking into account both its stability and the stresses imposed on its structures and that cargoes will be properly stowed and suitably secured and that the speed and course of the ship are adapted to the prevailing sea and weather conditions according to the normal prudent seamanship.

**3.3.2** Ships are to be maintained at all times, at the diligence of the Owners, in proper condition complying with international safety and pollution prevention regulations.

**3.3.3** Any document issued by the Society in relation to its interventions reflects the condition of the ship as found at the time and within the scope of the survey. It is the Interested Party's responsibility to ensure proper maintenance of the ship until the next survey required by the Rules. It is the duty of the Interested Party to inform the Surveyor when he boards the ship of any events or circumstances affecting the class.

## **3.4 Flag and Port State Control inspections**

**3.4.1** Where defects are found further to an inspection by an Administration in pursuance of Port State Control or similar programmes, Owners are to:

- inform the Society about any deficiency related to the class of the ship or to the statutory certificates issued by the Society on behalf of the flag Administration, and provide its action plan for rectification of these deficiencies. It will be verified by next attending Surveyors that deficiencies are rectified and/or that the necessary repair work is carried out within due time.
- immediately report the outcome of this inspection to the Society when the ship is detained, and ask to the Society to perform an occasional survey.

## **3.5 Use of measuring equipment and of service suppliers**

### **3.5.1 General**

Firms providing services on behalf of the Interested Party, such as measurements, tests and servicing of safety systems and equipment, the results of which may form the basis for the Surveyor's decisions, are subject to the acceptance of the Society, as deemed necessary.

The equipment used during tests and inspections in workshops, shipyards and on board ships, the results of which may form the basis for the Surveyor's decisions, is to be customary for the checks to be performed. Firms are to individually identify and calibrate to a national or international standard each piece of such equipment.

Note 1: Refer to Rule Note NR 533 Approval of Service Suppliers.

### **3.5.2 Simple measuring equipment**

The Surveyor may accept simple measuring equipment (e.g. rulers, tape measures, weld gauges, micrometers) without individual identification or confirmation of calibration, provided it is of standard commercial design, properly maintained and periodically compared with other similar equipment or test pieces.

### **3.5.3 Shipboard measuring equipment**

The Surveyor may accept measuring equipment fitted on board a ship (e.g. pressure, temperature or rpm gauges and meters) and used in examination of shipboard machinery and/or equipment based either on calibration records or comparison of readings with multiple instruments.

## **3.6 Spare parts**

**3.6.1** It is the Owner's responsibility to decide whether and which spare parts are to be carried on board.

**3.6.2** As spare parts are outside the scope of classification, the Surveyor will not check that they are kept on board, maintained in a satisfactory condition, or suitably protected and lashed.

However, in the case of repairs or replacement, the spare parts used are to meet the requirements of the Rules as far as practicable; refer to Ch 2, Sec 2, [6.4.2].

## **3.7 Quality system audits**

**3.7.1** Attention is drawn to the possibility that auditors external to the Society may attend surveys and audits carried out by the Society and that this attendance shall not be obstructed.

# **4 Application of statutory requirements by the Society**

## **4.1 International and national regulations**

**4.1.1** Where requirements of International Conventions, such as SOLAS, ILLC, MARPOL, ILO or of IMO Assembly Resolutions, are quoted as excerpts, they are printed in italic type replacing the word "Administration" with "Society".

These requirements are quoted for ease of reference.

**4.1.2** When authorised by the Administration concerned, the Society will act on its behalf within the limits of such authorisation. In this respect, the Society will take into account the relevant national requirements, survey the ship, report and issue or contribute to the issue of the corresponding certificates.

The above surveys do not fall within the scope of the classification of ships, even though their scope may overlap in part and may be carried out concurrently with surveys for assignment or maintenance of class.

**4.1.3** In the case of a discrepancy between the provisions of the applicable international and national regulations and those of the Rules, normally, the former take precedence. However, the Society reserves the right to call for the necessary adaptation to preserve the intention of the Rules or to apply the provisions of [1.4.1].

**4.1.4** In statutory matters, when authorized by the Administration concerned and acting on its behalf, the Society applies the available IACS Unified Interpretations (UIs), unless provided with written instruction to apply a different interpretation by the flag Administration.

## Section 2 Classification Notations

### 1 General

#### 1.1 Purpose of the classification notations

**1.1.1** The classification notations give the scope according to which the class of the ship has been based and refer to the specific rule requirements which are to be complied with for their assignment. In particular, the classification notations are assigned according to the type, service and navigation of the ship and other criteria which have been provided by the Interested Party, when applying for classification.

The Society may change the classification notations at any time, when the information available shows that the requested or already assigned notations are not suitable for the intended service, navigation and any other criteria taken into account for classification.

Note 1: Reference should be made to Ch 1, Sec 1, [1.3] on the limits of classification and its meaning.

**1.1.2** The classification notations assigned to a ship are indicated on the Certificate of Classification, as well as in the Register of Ships published by the Society.

**1.1.3** The classification notations assigned to ships and units, other than those covered in Parts B, C, D, E and F, which are to comply with specific Rules published by the Society are given in Ch 1, App 1.

**1.1.4** The classification notations applicable to existing ships conform to the Rules of the Society in force at the date of assignment of class, as indicated in Ch 2, Sec 1. However, the classification notations of existing ships may be updated according to the current Rules, as far as applicable.

**1.1.5** The classification notations applicable to diving systems are defined in NR610, Rules for the Classification of Diving Systems. The requirements in [1.2] and from Articles [2] to [7] are not applicable to diving systems.

The diving systems are assigned with one of the service notations defined in [8].

#### 1.2 Types of notations assigned

**1.2.1** The types of classification notations assigned to a ship are the following:

- a) class symbol
- b) construction marks
- c) service notations with additional service features, as applicable
- d) navigation notations
- e) operating area notations (optional)
- f) additional class notations (optional).

The different classification notations and their conditions of assignment are listed in Articles [2] to [6], according to their types.

**1.2.2** As an example, the classification notations assigned to a ship may be as follows (the kind of notation shown in brackets does not form part of the classification notation indicated in the Register of Ships and on the Certificate of Classification):

**I ✕ HULL ✕ MACH**

(class symbol, construction marks)

**oil tanker chemical tanker ESP-Flash point > 60°C**

(service notation and additional service features)

**unrestricted navigation**

(navigation notation)

**✕ SYS-IBS-1**

(additional class notation)

### 2 Class symbol

#### 2.1 General

**2.1.1** The class symbol expresses the degree of compliance of the ship with the rule requirements as regards its construction and maintenance. There is one class symbol, which is compulsory for every classed ship.

**2.1.2** The class symbol **I** is assigned to ships built in accordance with the requirements of the Rules or other rules recognised as equivalent, and maintained in a condition considered satisfactory by the Society.

The period of class (or interval between class renewal surveys) assigned to class symbol **I** ships is maximum 5 years, see Ch 2, Sec 2, [4].

Note 1: The class symbol **I** is to be understood as being the highest class granted by the Society.

**2.1.3** The class symbol **II** is assigned to ships which do not meet all requirements for class symbol **I**, but are deemed acceptable to be entered into the Register of Ships.

The period of class assigned to class symbol **II** ships is maximum 3 years, see Ch 2, Sec 2, [4].

**2.1.4** Except for special cases, class is assigned to a ship only when the hull, propulsion and auxiliary machinery installations, and equipment providing essential services have all been reviewed in relation to the requirements of the Rules.

### 3 Construction marks

#### 3.1 General

**3.1.1** The construction mark identifies the procedure under which the ship and its main equipment or arrangements have been surveyed for initial assignment of the class. The procedures under which the ship is assigned one of the construction marks are detailed in Ch 2, Sec 1.

**3.1.2** One of the construction marks defined below is assigned separately to the hull of the ship and its appendages, to the machinery installation, and to some installations for which an additional classification notation (see [6] below) is assigned.

The construction mark is placed before the symbol **HULL** for the hull, before the symbol **MACH** for the machinery installations, and before the additional class notation granted, when such a notation is eligible for a construction mark.

If the ship has no machinery installations covered by classification, the symbol **MACH** is not granted and the construction mark will be only placed before the symbol **HULL**.

Note 1: for ships assigned with the service notation **yacht** or **charter yacht** and having a length less than 24 m, see additional requirements defined in NR500.

**3.1.3** The construction marks refer to the original condition of the ship. However, the Society may change the construction mark where the ship is subjected to repairs, conversion or alterations.

#### 3.2 List of construction marks

**3.2.1** The mark **⊠** is assigned to the relevant part of the ship, when it has been surveyed by the Society during its construction in compliance with the new building procedure detailed in Ch 2, Sec 1, [2.1], or when it is changing class from an IACS Society at ship's delivery or when class is being added to an IACS Society's class at ship's delivery in accordance with specific procedures.

**3.2.2** The mark **⊡** is assigned to the relevant part of the ship, when the latter is classed after construction in compliance with the procedure detailed in Ch 2, Sec 1, [3.2] and it is changing class from an IACS Society at the time of the admission to class.

**3.2.3** The mark **•** is assigned to the relevant part of the ship, where the procedure for the assignment of classification is other than those detailed in [3.2.1] and [3.2.2], but however deemed acceptable.

### 4 Service notations and corresponding additional service features

#### 4.1 General

**4.1.1** The service notations define the type and/or service of the ship which have been considered for its classification, according to the request for classification signed by the Interested Party. At least one service notation is to be assigned to every classed ship.

Note 1: The service notations applicable to existing ships conform to the Rules of the Society in force at the date of assignment of class. However, the service notations of existing ships may be updated according to the current Rules, as far as applicable, at the request of the Interested Party.

**4.1.2** The assignment of any service notation to a new ship is subject to compliance with the general rule requirements laid down in Part B and Part C of the present Rules and in NR216 Materials and Welding, and, for some service notations, with the additional requirements laid down in the corresponding Chapter of Part D and Part E.

Note 1: For a service notation defined in a Rule Note, the assignment of this service notation to a new ship is subject to compliance with the general rule requirements laid down in Part B and Part C of the present Rules and in NR216 Materials and Welding, and with the additional requirements laid down in the relevant Rule Note and, if relevant, with the requirements laid down in:

- NR600 Hull Structure and Arrangement for the Classification of Cargo Ships less than 65 m and Non Cargo Ships less than 90 m
- NR566 Hull Arrangement, Stability and Systems for Ships less than 500 GT.

**4.1.3** A ship may be assigned several different service notations. In such case, the specific rule requirements applicable to each service notation are to be complied with. However, if there is any conflict in the application of the requirements applicable to different service notations, the Society reserves the right to apply the most appropriate requirements or to refuse the assignment of one of the requested service notations.

**4.1.4** A service notation may be completed by one or more additional service features, giving further precision regarding the type of service of the ship, for which specific rule requirements are applied.

**4.1.5** The different service notations which may be assigned to a ship are listed in [4.2] to [4.16], according to the category to which they belong. These service notations are also listed in Tab 1 and Tab 2, where the correspondence between the service notation assigned by the Society and the type of ship defined by the International Conventions is also given for information. As a rule, all notations in [4.2], [4.3], [4.4] and [4.5] are only to be assigned to self-propelled units.

**Table 1 : List of service notations and additional service features**

Service notation [ref. in Part A] Additional service feature	Reference Reference	Corresponding type of ship according to Conventions and/or Codes
<b>anchor handling</b> [4.11.2]	Part E, Chapter 2	Cargo ship (SOLAS, Reg I/2(g))

Service notation [ref. in Part A]	Reference	Corresponding type of ship according to Conventions and/or Codes
Additional service feature	Reference	
(1)		For ships intended to carry only one type of cargo.
(2)		Additional indications: for <b>BC-A: (holds a, b, ..., ... may be empty)</b> and <b>(Block-loading)</b> if applicable; for <b>BC-A</b> or <b>BC-B</b> and if $x.y$ is less than $3 \text{ t/m}^3$ : <b>(maximum cargo density <math>x.y \text{ t/m}^3</math>)</b> ; for <b>BC-A, BC-B</b> or <b>BC-C: (no MP)</b> if applicable.
(3)		Completed with indication of the different maximum loads allowed in each hold and which holds may be empty, if appropriate.
(4)		Bulk carriers and Oil tankers assigned with the additional service feature <b>CSR</b> contracted for new construction on or after 1 July 2015 are to comply with the requirements of NR606 Common Structural Rules for Bulk Carriers and Oil Tankers.
(5)		Ships assigned the service notation <b>bulk carrier CSR</b> completed by the additional service features <b>BC-A</b> or <b>BC-B</b> , are always to be assigned the additional service feature <b>GRAB[X]</b> .
(6)		Ships assigned the additional service feature <b>CSR</b> and contracted for construction on or after 8 December 2006 are always to be assigned the additional service feature <b>CPS(WBT)</b> .
(7)		The type of service may be specified after the service notation, e.g. <b>light ship/fast passenger vessel, light ship/fast cargo vessel, light ship/fast patrol vessel.</b>
(8)		<b>icebreaker</b> may be completed by <b>1, 2, 3, 4, 5, 6</b> or <b>7</b> .
(9)		<b>LNG bunkering</b> may be completed by <b>RE, Initial-CD, IG Supply</b> and <b>BOG</b>
(10)		<b>Ammonia bunkering</b> may be completed by <b>RE, IG Supply, BOG, Effluent recovery</b> and <b>VPS</b>
(11)		These notations are not linked with technical requirements but are always completed by other service notation(s) to define applicable requirements as defined in [4.12] and listed in Tab 2.
(12)		No additional requirements are specified in Part D for this service notation; however requirements of Part F, Chapter 7 for the assignment of the additional class notation <b>REF-CARGO</b> are to be applied.
(13)		These ships are considered on a case by case basis by the Society according to their type of service.
(14)		The type of service is to be specified after the service notation.
(15)		Corresponding to hull material as defined in NR500.
(16)		For any ship equipped with a wind propulsion system except ships assigned the service notation <b>yacht</b> or <b>charter yacht</b> . For ships assigned the service notation <b>yacht</b> or <b>charter yacht</b> , reference is made to [6.25.5].

## 4.2 Cargo ships

4.2.1 The service notations related to self-propelled ships intended for the carriage of cargo are listed in [4.2.2] to [4.2.7].

4.2.2 The service notation **general cargo ship** is assigned to ships intended to carry general cargo.

The service notation may be completed by the following additional service feature, as applicable:

- **equipped for carriage of containers**, where the ship's fixed arrangements comply with the applicable rule requirements in Part D, Chapter 2.
- **heavycargo [AREA1, X1 kN/m<sup>2</sup> - AREA2, X2 kN/m<sup>2</sup> - ...]**, as defined in [4.16.10].
- **nonhomload**, when the ship has been designed in such a way that the cargo spaces may be loaded non-homogeneously, including cases where some holds may be empty, at a draught up to the scantling draught and fulfil the appropriate rule requirements for general strength, and when the corresponding loading conditions are listed in the reviewed loading manual. This notation may be completed with the indication of the different maximum loads allowed in each hold and which holds may be empty, if appropriate.
- **occasional dry bulk cargo**, for ships the keels of which are laid or which are at a similar stage of construction on or after the 1st July 2010, and which occasionally carry dry cargoes in bulk, as described in IMO Res.MSC 277(85), paragraphs 1.6 and 1.7.

The additional requirements of Ch 4, Sec 7 are applicable to these ships.

4.2.3 The service notation **ro-ro cargo ship** is assigned to ships specially intended to carry vehicles, trains or loads on wheeled beds. The additional requirements of Ch 4, Sec 6 and Part D, Chapter 1 are applicable to these ships. The service notation may be completed by the additional service feature **equipped for carriage of containers**, where the ship's fixed arrangements comply with the applicable requirements of Part D, Chapter 2.

4.2.4 The service notations **PCTC** (pure car and truck carrier) or **PCC** (pure car carrier) are assigned to ships with high number of decks, specially intended to carry road vehicles as cargo.

The additional requirements of Ch 4, Sec 6 and Part D, Chapter 1 are applicable to these ships.

Note 1: Ships assigned the service notation **PCT Carrier** before 1st July 2023, are to be assigned the service notation **PCTC** at the first renewal survey held after 1 July 2023, or before upon request from the Owner.

4.2.5 The service notation **refrigerated cargo ship** is assigned to ships specially intended to carry refrigerated cargo. No additional requirements are specified in Part D for this service notation; however, the requirements of Part F, Chapter 7 for the assignment of the additional class notation **REF-CARGO** are to be applied. The service notation may be completed by the additional service feature **equipped for carriage of containers**, where the ship's fixed arrangements comply with the applicable rule requirements in Part D, Chapter 2.

**4.2.6** The service notation **container ship** is assigned to ships specially intended to carry containers in holds or on decks. The additional requirements of Ch 4, Sec 8, [2] and Part D, Chapter 2 are applicable to these ships.

For container ships complying with the requirements of NR583 Whipping and Springing Assessment, the service notation is to be completed by the additional service features **WhiSp1** or **WhiSp2**.

**4.2.7** The service notation **livestock carrier** is assigned to ships specially intended to carry livestock. The additional requirements of Ch 4, Sec 8, [3] and Part D, Chapter 3 are applicable to these ships.

**4.2.8** The service notation **deck ship** is assigned to ships specially intended to carry cargo exclusively on the deck.

Note 1: A ship with service notation **deck ship** is usually but not necessarily a self-propelled unit intended for unrestricted navigation.

**4.2.9** The service notation **semi-submersible cargo ship** is assigned to ships intended to perform loading and unloading operations of a floating cargo by submersion of the freeboard deck in accordance with the requirements Part E, Chapter 9.

The service notation **semi-submersible cargo ship** is completed by the additional service feature **heavycargo [AREA 1, X1 kN/m<sup>2</sup> - ...]** as defined in [4.16.10].

One of the additional class notations **LI-HG-S2** or **LI-HG-S3** is to be assigned.

The service notation **semi-submersible cargo ship** is always completed by the additional class notation **SDS**.

The additional requirements of Ch 4, Sec 8, [17] are applicable to these ships.

### 4.3 Bulk, ore and combination carriers

**4.3.1** The service notations related to self-propelled ships specially intended for the carriage of dry cargo in bulk are those listed in:

- [4.3.2] for the service notation **bulk carrier ESP**
- [4.3.3] for the service notation **ore carrier ESP**
- [4.3.4] for the service notation **combination carrier/OBO ESP**
- [4.3.5] for the service notation **combination carrier/OOC ESP**
- [4.3.6] for the service notation **self-unloading bulk carrier ESP**
- or in Part D, Chapter 4 for the service notation **bulk carrier** when the ship does not meet the forthcoming conditions.

The service notations described in [4.3.2] to [4.3.6] are always completed by the additional service feature **ESP**, which means that these ships are submitted to the Enhanced Survey Program as laid down in Ch 4, Sec 2.

Example: **ore carrier ESP**.

Note 1: Self-propelled ships are ships with mechanical means of propulsion not requiring assistance from another ship during normal operation.

**4.3.2** The service notation **bulk carrier ESP** is assigned to sea going self-propelled ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo length area and intended primarily to carry dry cargoes in bulk. Typical midship sections are illustrated in Fig 1, or a midship section deemed equivalent by the Society. The additional requirements of Part D, Chapter 4 are applicable to these ships.

The service notation **bulk carrier ESP** is always completed by one of the following additional service features, for bulk carriers of length greater than or equal to 150 m contracted for new construction on or after 1 July 2003:

- **BC-A**, for bulk carriers designed to carry dry bulk cargoes of density 1.0 t/m<sup>3</sup> and above with specified holds empty at maximum draught in addition to BC-B conditions
- **BC-B**, for bulk carriers designed to carry dry bulk cargoes of density 1.0 t/m<sup>3</sup> and above with all cargo holds loaded in addition to BC-C conditions
- **BC-C**, for bulk carriers designed to carry dry bulk cargoes of density less than 1.0 t/m<sup>3</sup>.

**Figure 1 : Typical midship sections of ships with service notation bulk carrier ESP**

Left: Single side skin construction

Right: Double side skin construction.

The additional service feature **BC-A** is completed with the indication of the allowed combination of specified empty holds, as follows: (**holds a, b, ..., ... may be empty**).

If limitations are to be observed during operation:

- the additional service features **BC-A** and **BC-B** are completed, when the maximum cargo density is less than 3.0 t/m<sup>3</sup>, with the indication of the maximum density of cargo that the ship is allowed to carry, as follows: (**maximum cargo density x.y t/m<sup>3</sup>**)
- the additional service features **BC-A**, **BC-B** and **BC-C** are completed by the following indication when the vessel has not been designed for loading and unloading in multiple ports: (**no MP**).
- the additional service feature **BC-A** is completed by the notation (**Block-loading**) when the ship is intended to operate in alternate block load condition, according to Common Structural Rules for Bulk Carriers and Double Hull Oil Tankers (Rule Note NR606), Pt 1, Ch 1, Sec 1, [3.2.1]. The requirements for (**Block-loading**) notation are defined in NR606, Pt 1, Ch 4, Sec 8, [4.2.3].

Examples:

**bulk carrier BC-A (maximum cargo density 2.5 t/m<sup>3</sup>; holds 2, 4, 6 may be empty) ESP**

**bulk carrier BC-B (maximum cargo density 2.5 t/m<sup>3</sup>; no MP) ESP**

**bulk carrier BC-C (no MP) ESP**

For ships contracted for new construction before 1 July 2003 or for ships contracted for new construction on or after 1 July 2003 but less than 150 m in length, the service notation **bulk carrier ESP** may be completed by the additional service features **heavycargo** or **nonhomload** defined under [4.2.2].

The service notation **bulk carrier ESP** is always completed by the additional service feature **CSR** for bulk carriers of length greater than or equal to 90 m contracted for new construction on or after 1 April 2006.

Bulk carriers assigned with the additional service feature **CSR** are to comply with the requirements of:

- the Common Structural Rules for Bulk Carriers (Rule Note NR522), when contracted for construction on or after 1 April 2006 and before 1 July 2015. The elements not dealt with in NR522 are to comply with the requirements of Part B, Part C and Part D of the Rules for the Classification of Steel Ships.

Note 1: Hybrid bulk carriers, where at least one cargo hold is constructed with hopper tank and topside tank, are covered by NR522. The structural strength of members in holds constructed without hopper tank and/or topside tank is to comply with the strength criteria defined in NR522.

- the Common Structural Rules for Bulk Carriers and Oil Tankers (Rule Note NR606) when contracted for construction on or after 1 July 2015. The elements not dealt with in NR522 are to comply with the requirements of Part B, Part C and Part D of the Rules for the Classification of Steel Ships.

Bulk carriers assigned with the additional service feature **CSR** and with holds designed for loading/unloading by grabs having a maximum specific weight up to [X] tons are assigned the notation **GRAB [X]** according to NR522 (Common Structural Rules for Bulk Carriers), Ch 1, Sec 1, [3.2.1] or NR606 (Common Structural Rules for Bulk Carriers and Oil Tankers), Pt 1, Ch 1, Sec 1, [3.2.2], as applicable. The requirements for **GRAB [X]** notation are given in NR522, Ch 12, Sec 1 or NR606, Pt 2, Ch 1, Sec 6, as applicable.

For bulk carriers assigned with the additional service feature **CSR**, and one of the additional service features **BC-A** or **BC-B**, these additional service features are always completed by the additional service feature **GRAB [X]**. For these ships, the requirements for the **GRAB [X]** notation are to be complied with for an unladen grab weight X equal to or greater than 20 tons.

For bulk carriers assigned with the additional service feature **CSR** others than above, the additional class notation **GRAB [X]** may be assigned on a voluntary basis (refer to [6.13.2], item a)).

Bulk carriers assigned with the additional service feature **CSR** are to comply with the requirements for maintenance of class, thickness measurements and acceptance criteria given in NR522, Chapter 13 or NR606, Part 1, Chapter 13 as applicable.

For bulk carriers assigned with the additional service feature **CSR** and contracted for construction on or after 8 December 2006, this additional service feature is always completed by the additional service feature **CPS(WBT)** for which the rule requirements of NR530 Coating Performance Standard, applicable to ships complying with the requirements of the Common Structural Rules for Bulk Carriers or the Common Structural Rules for Double Hull Oil Tankers and related to protective coatings in dedicated seawater ballast tanks of ships of not less than 500 gross tonnage and double-side skin spaces arranged in bulk carriers of length greater than or equal to 150 m, are applied.

Example:

**bulk carrier CSR CPS(WBT) BC-A (maximum cargo density 2.5 t/m<sup>3</sup>; holds 2, 4, 6 may be empty) ESP GRAB [20]**

Note 2: Attention is drawn on the coating condition which is surveyed as per the requirements of Ch 4, Sec 2 for ships in service.

**4.3.3** The service notation **ore carrier ESP** is assigned to sea going self-propelled ships which are constructed generally with single deck, two longitudinal bulkheads and a double bottom throughout the cargo length area and intended primarily to carry ore cargoes in the centre holds only. Typical midship sections are illustrated in Fig 2, or a midship section deemed equivalent by the Society. The additional requirements of Part D, Chapter 5 are applicable to these ships.

Figure 2 : Typical midship sections of ship with service notation ore carrier ESP

4.3.4 The service notation **combination carrier/OBO ESP** is assigned to sea going self-propelled ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in the cargo length area, and intended primarily to carry oil or dry cargoes, including ore, in bulk. Typical midship sections are illustrated in Fig 3, or a midship section deemed equivalent by the Society. The additional requirements of Part D, Chapter 6 are applicable to these ships.

Note 1: Ships assigned with the service notation **combination carrier/ OBO ESP** that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phase out.

Figure 3 : Typical midship sections of ship with service notation combination carrier/OBO ESP

Left: Single side skin construction

Right: Double side skin construction.

4.3.5 The service notation **combination carrier/OOC ESP** is assigned to sea going self-propelled ships which are constructed generally with single deck, two longitudinal bulkheads and a double bottom throughout the cargo length area and intended primarily to carry ore cargoes in the centre holds or oil cargoes in centre holds and wing tanks. Typical midship sections are illustrated in Fig 4, or a midship section deemed equivalent by the Society. The additional requirements of Part D, Chapter 6 are applicable to these ships.

Note 1: “combination carrier” is a general term applied to ships intended for the carriage of both oil and dry cargoes in bulk; these cargoes are not carried simultaneously, with the exception of oily mixture retained in slop tanks.

Note 2: Ships assigned with the service notation **combination carrier/OOC ESP** that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phase out.

Figure 4 : Typical midship sections of ships with service notation combination carrier/OOC ESP

**4.3.6** The service notation **self-unloading bulk carrier ESP** is assigned to sea going self-propelled ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks with single or double side skin construction in cargo area and intended primarily to carry and self-unload dry cargoes in bulk. Typical midship sections are given in Fig 5, or a midship section deemed equivalent by the Society. The additional requirements of Part D, Chapter 4 are applicable to these ships.

The service notation **self-unloading bulk carrier ESP** may be completed by the additional service feature **heavycargo** or **nonhomload** defined in [4.2.2].

**Figure 5 : Typical midship sections of ship with service notation self-unloading bulk carrier ESP**

#### 4.4 Ships carrying liquid cargo in bulk

**4.4.1** The service notations related to self-propelled ships intended for the carriage of liquid cargo in bulk are listed in [4.4.2] to [4.4.9].

**4.4.2** The service notation **oil tanker** is assigned to sea going self-propelled ships which are constructed generally with integral tanks and intended primarily to carry in bulk crude oil, other oil products, or oil-like substances having any flash point, or liquid at atmospheric pressure and ambient temperature (or thus maintained by heating). This notation may be assigned to tankers of both single and double hull construction, as well as tankers with alternative structural arrangements, e.g. mid-deck designs.

The service notation may be completed by the additional service feature **flash point > 60°C**, as applicable, where the ship is intended to carry only such type of products, under certain conditions.

The service notation may be completed by the additional service feature **asphalt carrier**, where the ship is intended to carry such type of products, under certain conditions. The maximum cargo temperature is to be indicated on the Certificate of Classification.

The additional requirements of Part D, Chapter 7 are applicable to these ships.

For ships with integral cargo tanks, the service notation **oil tanker** is always completed by the additional service feature **ESP** (i.e. **oil tanker ESP**), which means that these ships are submitted to the Enhanced Survey Program as laid down in Ch 4, Sec 3. Typical midship sections are illustrated in Fig 6.

The service notation **oil tanker ESP** is always completed by the additional service feature **CSR** for double hull oil tankers of length greater than or equal to 150 m and contracted for new construction on or after 1 April 2006.

Oil tankers assigned with the additional service feature **CSR** are to comply with the requirements of:

- the Common Structural Rules for Double Hull Oil Tankers (Rule Note NR523), when contracted for construction on or after 1 April 2006 and before 1 July 2015. The elements not dealt with in NR523 are to comply with the requirements of Part B, Part C and Part D of the Rules for the Classification of Steel Ships.
- the Common Structural Rules for Bulk Carriers and Oil Tankers (Rule Note NR606), when contracted for construction on or after 1 July 2015. The elements not dealt with in NR523 are to comply with the requirements of Part B, Part C and Part D of the Rules for the Classification of Steel Ships.

Oil tankers assigned with the additional service feature **CSR** are to comply with the requirements for ship in operation renewal criteria given in NR523, Section 12, or NR606, Part 1, Chapter 13, as applicable, related to the allowable thickness diminution for hull structure.

For oil tankers assigned with the additional service feature **CSR** and contracted for construction on or after 8 December 2006, this additional service feature is always completed by the additional service feature **CPS(WBT)** for which the rule requirements of NR530 Coating Performance Standard, applicable to ships complying with the requirements of the Common Structural Rules for Bulk Carriers or the Common Structural Rules for Double Hull Oil Tankers and related to protective coatings in dedicated seawater ballast tanks of ships of not less than 500 gross tonnage and double-side skin spaces arranged in bulk carriers of length greater than or equal to 150 m, are applied.

Example:

##### **Oil tanker CSR CPS(WBT) ESP**

Note 1: Attention is drawn on the coating condition which is surveyed as per the requirements of Ch 4, Sec 3 for ships in service.

Note 2: Ships assigned with the service notation **oil tanker ESP** that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phase out under MARPOL I/20 and/or MARPOL I/21.

Figure 6 : Typical midship sections of ships with service notation oil tanker ESP

4.4.3 The service notation **asphalt carrier** is assigned to sea going self-propelled ships which are constructed with independent (non-integral) cargo tanks, intended to carry only such type of products, under certain conditions. The additional requirements of Part D, Chapter 7 are applicable to these ships.

The maximum cargo temperature is to be indicated on the Certificate of Classification.

4.4.4 The service notation **chemical tanker** is assigned to sea going self-propelled ships which are constructed generally with integral tanks and intended primarily to carry chemicals in bulk. This notation may be assigned to tankers of both single or double hull construction, as well as tankers with alternative structural arrangements. Typical midship sections are illustrated in Fig 7, or a midship section deemed equivalent by the Society.

For ships with integral cargo tanks, the service notation **chemical tanker** is always completed by the additional service feature **ESP** (i.e. **chemical tanker ESP**), which means that these ships are submitted to the Enhanced Survey Programme as laid down in Ch 4, Sec 4.

The service notation **chemical tanker** is to be completed by the corresponding ship type **IMO Type 1**, **IMO Type 2** or **IMO Type 3**, as relevant and as defined in the IMO IBC Code as amended.

For ships intended to carry only one type of cargo, the service notation may be completed by the additional service feature indicating the type of product carried.

The list of products the ship is allowed to carry is attached to the Certificate of Classification or the Certificate of Fitness, where issued by the Society, including, where necessary, the maximum allowable specific gravity and/or temperature.

The service notation **chemical tanker** is to be completed by the additional service feature **Methanol bunkering** when intended to ensure the transfer of methanol cargo to ships for use as a fuel.

Example:

**chemical tanker ESP IMO Type 1**

**chemical tanker IMO Type 3 - Molten Sulphur**

**chemical tanker ESP IMO Type 2 Methanol bunkering**

The requirements for the assignment of these notations are given in:

- Part D, Chapter 8, and
- in addition for the additional service feature **Methanol bunkering** in NR620.

The requirements for the maintenance of these notations are given in Ch 4, Sec 4.

Figure 7 : Typical midship sections of ships with service notation chemical tanker ESP

**4.4.5** The service notation **liquefied gas carrier** is assigned to ships specially intended to carry liquefied gases or other substances listed in Pt D, Ch 9, Sec 1 of the Rules. The additional requirements of Ch 4, Sec 5 and Part D, Chapter 9 are applicable to these ships.

The list of products the ship is allowed to carry is attached to the Certificate of Classification or the Certificate of Fitness, where issued by the Society, including, where necessary, the conditions of transportation (pressure, temperature, filling limits).

The service notation is to be completed by the following additional service feature indicating the cargo type, the IMO code ship type, the cargo tank design pressure  $P_{design}$  and minimum temperature  $T_{min}$ : (**[cargo type]**, **[ship type]**, **[ $P_{design}$ ]**, **[ $T_{min}$ ]**) with:

- [cargo type] to be taken as one of the following:
  - **LNG**, when carrying liquefied natural gas
  - **LEG**, when carrying liquefied ethane gas ( $C_2H_6$ )
  - **LPG**, when carrying liquefied petroleum gas
  - **LCO2**, when carrying liquefied carbon dioxide
  - **LNH3**, when carrying liquefied ammonia.
- [ship type] to be taken as one of the following: **IMO Type 1G**, **IMO Type 2G**, **IMO Type 2PG** or **IMO Type 3G**
- [ $P_{design}$ ] the value of the maximum vapour pressure, in barg
- [ $T_{min}$ ] the value of the minimum cargo temperature, in °C.

The service notation may be completed by the additional service feature **LNG bunkering** when intended to ensure the transfer of LNG cargo to ships for use as a fuel.

The service notation may be completed by the additional service feature **Ammonia bunkering** when intended to ensure the transfer of ammonia cargo to ships for use as a fuel.

The service notation is completed by the following additional service features, as applicable:

- for all liquefied gas carriers:
  - **BOG-reliquefaction**, where the ship is fitted with a reliquefaction installation. The requirements for the assignment of this additional service feature are given in Pt D, Ch 9, Sec 1, [7]
  - **LNG-subcooling**, where the ship is fitted with a cooling installation aiming at reducing the cargo temperature. The requirements for the assignment of this additional service feature are given in Pt D, Ch 9, Sec 1, [7]
  - **REGAS**, where the ship is fitted with an installation for revaporization of the liquefied natural gas. The requirements for the assignment of this additional service feature are given in NR645, Sec 10
  - **STL-SPM**, where the ship is used as re-gasification terminal and fitted forward with equipment for non permanent mooring or single buoy. The requirements for the assignment of this additional service feature are given in Pt D, Ch 9, Sec 1, [8].
- in addition, for liquefied gas carriers assigned the additional service feature **LNG bunkering** or **Ammonia bunkering**:
  - **RE**, where the ship is designed to receive LNG or  $LNH_3$  from a gas fuelled ship for which the LNG or  $LNH_3$  fuel tanks have to be emptied
  - **Initial-CD**, where the ship is designed for initial cooling down of the gas fuelled ship LNG fuel tank
  - **IG-Supply**, where the ship is designed to supply inert gas and dry air, to ensure gas freeing and aeration, to a gas fuelled ship complying with the IGF Code, paragraph 6.10.4
  - **BOG**, where the ship is designed to recover and manage the boil-off gas generated during the bunkering operation
  - **Effluent recovery**, where the ship is designed to recover effluents containing dissolved  $NH_3$  fuel from the bunkered ship
  - **VPS**, where the ship is designed to manage the  $NH_3$  vapor released in normal or failure operation

Example:

**liquefied gas carrier (LNG, IMO Type 2G, 0,35 barg, -163°C) REGAS STL-SPM**

**liquefied gas carrier (LNG, IMO type 2G, 10 barg, -163°C) LNG bunkering REGAS RE Initial-CD**

**liquefied gas carrier (LNH3, IMO type 2G, 1 barg, -36°C) Ammonia bunkering REGAS Effluent recovery VPS**

The requirements of Part D, Chapter 9 are applicable to these ships. In addition, the requirements for the assignment of the additional service feature **LNG bunkering** or **Ammonia bunkering** are given in NR 620.

The requirements for the maintenance of the service notation are given in Ch 4, Sec 5.

Note 1: Ships assigned the service notation **LNG bunkering ship** before 1st July 2023, are to be assigned the service notation **liquefied gas carrier** at the first renewal survey held after 1 July 2023, or before, upon request from the Owner.

**4.4.6** The service notation **FLS tanker**, for ships specially intended to carry in bulk flammable liquid products other than those covered by the service notations **oil tanker**, **chemical tanker** or **liquefied gas carrier**.

The list of products the ship is allowed to carry may be attached to the Certificate of Classification, including, where necessary, the maximum allowable specific gravity and/or temperature.

The service notation may be completed by the additional service feature **flash point > 60°C**, where the ship is intended to carry only such type of products, under certain conditions.

For ships intended to carry only one type of cargo, the service notation may be completed by the additional service feature indicating the type of product carried.

The additional requirements of Ch 4, Sec 8, [4] and Part D, Chapter 7 are applicable to these ships.

**4.4.7** The service notation **tanker** is assigned to ships intended to carry non-flammable liquid cargoes in bulk other than those covered by the service notations in [4.4.2] to [4.4.6], such as water.

The list of cargoes the ship is allowed to carry may be attached to the Certificate of Classification.

For ships intended to carry only one type of cargo, the service notation may be completed by the additional service feature indicating the type of product carried, e.g. **tanker-water**.

The additional requirements of Part D, Chapter 10 are applicable to these ships.

**4.4.8** Refer also to [4.3.4] and [4.3.5] for **combination carrier** intended to carry alternatively oil products and dry cargo in bulk in cargo holds/tanks.

**4.4.9** The service notation **oil storage service** is assigned on a case by case basis and subject to flag agreement, to ships formerly granted with the service notation **oil tanker ESP** and intended to be used as oil storage unit with the following restrictions:

- the ship is stationed at a single location, without transit or carriage of cargo between ports or different sites
- the use of the ship will be limited to storage in a dedicated single location. This location is to be situated in a sheltered area or an area enabling the ship to quickly move away from severe weather conditions
- the provisions provided when the ship is in its storage service period are no longer applicable if the ship leaves the dedicated storage service location, except when moving away from severer weather conditions
- when seeking shelter from severe weather conditions into a port of refuge, the ship is not allowed to discharge to a terminal, except on a case by case basis where repairs in a shipyard are required
- the ship may move without cargo on board to repair facilities or lay-up site, on a case-by-case basis
- the **ESP** notation has been withdrawn as far as the vessel is stationed as an oil storage unit and will be reinstated as soon as the vessel leaves the storage site to resume trading.

Periodical bottom surveys can be performed afloat and to this end the additional class notation **INWATERSURVEY** defined in [6.25.1] is to be granted.

The machinery part is to remain classed and the additional class notation **MON-SHAFT** defined in [6.6.3] is to be granted.

When granting the service notation **oil storage service**, a memorandum is to be endorsed in order to record the following:

- date of change in service notation,
- date of withdrawal of ESP notation together with Flag agreement references,
- location where the unit is stationed together with navigation notation.

When a ship starts its period as a storage service, the normal survey requirements are still applicable as follows:

- hull class renewal survey is carried out according to ESP requirements as laid down in Ch 4, Sec 3, [6], with a possibility to have the concurrent bottom inspection done afloat, provided that conditions laid down in Ch 3, Sec 4, [3] are met,
- other periodical surveys are carried out according to Part A, Chapter 3 as applicable.

When completing the storage service period, and before resuming trading, all surveys from which the ship has been relaxed during its storage period, have to be carried out, including possible surveys in drydock condition; upon completion of satisfactory surveys, the service notation **oil tanker ESP** will be reinstated to the ship and related surveys will become fully applicable.

Note 1: the mooring arrangements of the vessel, including their compliance with any authority's requirement, are left to the responsibility of the owner when granted the service notation **oil storage service**.

## 4.5 Ships carrying passengers

**4.5.1** The service notations related to ships specially intended for the carriage of passengers are listed in [4.5.2] to [4.5.3].

**4.5.2** The service notation **passenger ship** is assigned to ships intended to carry more than 12 passengers. The additional requirements of Ch 4, Sec 6 and Part D, Chapter 11 are applicable to these ships.

The service notation may be completed by the additional service feature  $\leq 36$  **passengers**, where the ship is intended to carry only such a limited number of passengers.

The service notation is to be completed by the additional service feature **SRTP** for ships complying with the provisions of Part D, Chapter 11.

**4.5.3** The service notation **ro-ro passenger ship** is assigned to ships intended to carry more than 12 passengers and specially equipped to load trains or wheeled vehicles. The additional requirements of Ch 4, Sec 6 and Part D, Chapter 12 are applicable to these ships.

The service notation may be completed by the additional service feature  $\leq 36$  **passengers**, where the ship is intended to carry only such a limited number of passengers.

The service notation is to be completed by the additional service feature **SRTP** for ships complying with the provisions of Part D, Chapter 12.

## **4.6 High speed crafts (HSC)**

**4.6.1** The high speed crafts meeting the requirements of the Rules for the Construction and the Classification of High Speed Craft (NR396 UNITAS) are assigned the following service notations:

- For passenger ships which do not proceed in the course of their voyage more than four hours at operational speed from a place of refuge:
  - **HSC-CAT A** (or **high speed craft-CAT A**) for passenger ships defined as “Category A craft” in respect of the IMO International Code of Safety for High Speed Craft
  - **HSC-CAT B** (or **high speed craft-CAT B**) for passenger ships defined as “Category B craft” in respect of the IMO International Code of Safety for High Speed Craft
- For ships other than passenger ships and which do not proceed in the course of their voyage more than 8 h at operational speed from a place of refuge when fully laden:
  - **HSC** (or **high speed craft**)

The type of service may be specified after the notation.

**4.6.2** The service notation **light ship** is assigned to ships subject to compliance both with Chapter 3 and Chapter 6 of NR396 UNITAS Rules for the Classification of High Speed Craft, and with:

- for ships more than 500 GT: Part B and Part C of the present Rules, regarding stability and machinery installation
- for ships less than 500 GT: NR566 Hull Arrangement, Stability and Systems for Ships less than 500 GT.

The type of service may be specified after the service notation, e.g.:

**light ship/fast passenger vessel**

**light ship/fast cargo vessel**

**light ship/fast patrol vessel.**

These ships which are likely to operate at sea within specific limits may, under certain conditions, be granted an operating area notation. For the definition of operating area notation, reference should be made to [5.3].

## **4.7 Offshore patrol vessels**

**4.7.1** The service notation **OPV** is assigned to ships dedicated to patrol mission (i.e. smuggling, fishery inspection, customs-boarders protection...), with light weapon system and generally with no operational limit (neither weather condition restriction nor HS restriction). These ships could patrol at either low or high speed.

The additional requirements of Part D, Chapter 16 are applicable to these ships.

Note 1: For patrol craft operating only at high speed, the service notation **light ship/fast patrol vessel** is to be assigned in lieu of the notation **OPV** and relevant rules as stated in [4.6.2] and [5.2.8] apply.

## **4.8 Fishing vessels**

**4.8.1** The service notation **fishing vessel** is assigned to ships specially equipped for catching and storing fish or other living resources of the sea. The additional requirements of Ch 4, Sec 8, [14] and Part D, Chapter 15 are applicable to these ships.

The service notation **fishing vessel** may be completed by the following additional service features, as applicable:

- **F**, when the ship complies with the requirements of Pt D, Ch 15, Sec 6 related to fire prevention, ventilation systems and means of escape
- **TORRE**, when the Society has verified the compliance with the requirements for construction and equipment of fishing vessels of the Torremolinos International Convention for the Safety of Fishing Vessels, as amended
- **ED**, when the Society has verified the compliance with the requirements for construction and equipment of fishing vessels of the European Directive 97/70/EC, as amended.

Note 1: Units solely dedicated to service in a fishing flotilla by means of cold storage and/or transformation of fish are not covered by the service notation **fishing vessel**. They will be considered with the service notation **special service**.

## 4.9 Icebreaker ships

**4.9.1** The service notation **icebreaker** is assigned to ships having an operational profile that includes escort or ice management functions, having powering and dimensions that allow them to undertake independent operations in ice covered waters.

The service notations dealt with under [4.9.2] are relevant to ships intended for navigation in ice-infested polar waters.

The requirements for the assignment of these service notations are given in NR527 Rules for the Classification of POLAR CLASS and ICEBREAKER Ships.

Ships complying with the requirements of NR527 and assigned with one of the additional service notations **icebreaker** are also to comply with the requirements for the assignment of the additional class notation defined in [6.10.4]: **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**.

**4.9.2** The following service notations are assigned:

- **icebreaker 1** for summer/autumn operations without restrictions and for winter/spring operations in multi-year ice with 3,0 m max ice thickness
- **icebreaker 2** for summer/autumn operations in multi-year ice with 3,0 m max ice thickness and for winter/spring operations in second-year ice with 2,5 m max ice thickness
- **icebreaker 3** for summer/autumn operations in second-year ice with 2,5 m max ice thickness and for winter/spring operations in thick first-year ice with 1,8 m max ice thickness
- **icebreaker 4** for summer/autumn operations in thick first-year ice with 1,8 m max ice thickness and for winter/spring operations in medium first-year ice with 1,2 m max ice thickness
- **icebreaker 5** for summer/autumn operations in medium first-year ice with 1,2 m max ice thickness and for winter/spring operations in medium first-year ice with 1,0 m max ice thickness
- **icebreaker 6** for summer/autumn operations in medium first-year ice with 1,0 m max ice thickness and for winter/spring operations in medium first-year ice with 0,8 m max ice thickness
- **icebreaker 7** for summer/autumn operations in medium first-year ice with 0,8 m max ice thickness and for winter/spring operations in thin first-year ice with 0,6 m max ice thickness.

## 4.10 Tugs

### 4.10.1 General

Ships intended to tow and/or push other ships or units are assigned one of the service notation defined in [4.10.2], [4.10.3] or [4.10.4].

The additional requirements of Ch 4, Sec 8, [6] and Part E, Chapter 1 are applicable to these ships.

These service notations may be completed by the additional service feature **barge combined**, when the units are designed to be connected with barges and comply with the relevant requirements of Pt E, Ch 1, Sec 4. The barges to which the tug can be connected are specified in a memorandum.

These service notations are always completed by the additional service feature (**standardized design bollard pull = [T<sub>BP</sub>/9,81] t**).

Note 1: Ships contracted for construction before 1 July 2020 and not meeting the bollard pull test requirements for the assignment of the additional service feature (**standardized design bollard pull = [T<sub>BP</sub>/9,81] t**) are assigned the additional service feature (**design bollard pull = [T<sub>BP</sub>/9,81] t**), subject to bollard pull tests being carried out according to a procedure accepted by the Society.

The requirements for the assignment and the maintenance of this additional service feature are given respectively in Part E, Chapter 1 and Ch 4, Sec 8, [6].

Ships granted with the additional service feature (**design bollard pull = [T<sub>BP</sub>/9,81] t**) may be granted with the additional service feature (**standardized design bollard pull = [T<sub>BP</sub>/9,81] t**) after having satisfactorily carried out the bollard pull test laid down in Pt E, Ch 1, App 1.

These ships which are likely to operate at sea within specific limits may, under certain conditions, be granted an operating area notation. For the definition of operating area notation, reference should be made to [5.3].

### 4.10.2 Tug

The service notation **tug** is assigned to ships specially equipped for towing and/or pushing.

Note 1: The service notation **tug** may also be used as additional service notation combined with **offshore support vessel**.

### 4.10.3 Salvage tug

The service notation **salvage tug** is assigned to ships specially equipped for towing and/or pushing, having specific equipment for salvage.

#### 4.10.4 Escort tug

The service notation **escort tug** is assigned to ships specially equipped for towing and/or pushing having specific equipment for escorting ships or units during navigation.

The service notation **escort tug** is always completed by the following additional service features:

- **(design maximum braking force =  $[T_{x,MAX}/9,81]$  t)**

where the value  $T_{x,MAX}$  is the highest rated braking force over the applicable range of loading conditions and escort speeds

- **(design maximum escort speed =  $[V_{MAX}]$  kn)**

where the value  $V_{MAX}$  is the highest escort speed for which the escort tug is considered to perform escort operations

- **(design maximum steering force =  $[T_{y,MAX}/9,81]$  t)**

where the value  $T_{y,MAX}$  is the highest rated steering force over the applicable range of loading conditions and escort speeds.

#### 4.11 Working ships

##### 4.11.1 General

The service notations related to ships specially intended for different working services are listed in [4.11.2] to [4.11.5]. These service notations may be assigned directly to a ship or combined within the service notations **offshore support vessel** or **offshore construction vessel** defined in [4.12].

##### 4.11.2 Anchor handling vessel

The service notation anchor handling is assigned to towing vessels and/or supply vessels equipped with winches for anchor handling, having an open stern to allow the decking of anchors and an appropriate thrust to perform the intended anchor handling operations, consisting in deployment, recovering and repositioning of anchors and the associated mooring lines of rigs or other vessels. The additional requirements of Ch 4, Sec 8, [10] and Part E, Chapter 2 are applicable to these ships.

Note 1: As a rule, the service notation tug is also to be assigned in combination with the service notation anchor handling vessel; the additional requirements of Ch 4, Sec 8, [6] and Part E, Chapter 1 are applicable to these ships

##### 4.11.3 Fire-fighting ship

The service notation **fire-fighting** is assigned to ships specially intended and equipped for fighting fire. The additional requirements of Ch 4, Sec 8, [8] and Part E, Chapter 4 are applicable to these ships.

The service notation may be completed by the following additional service features, as applicable:

- **1** or **2** or **3**, when the ship complies with the applicable requirements of Pt E, Ch 4, Sec 3
- **E**, when the characteristics of the water fire-fighting system are not those required for the assignment of the additional service features **1**, **2** or **3**, and when the system is specially considered by the Society
- **water spraying**, when the ship is fitted with a water-spraying system complying with the applicable requirements of Pt E, Ch 4, Sec 4, [3].

##### 4.11.4 Oil recovery ship

The service notation **oil recovery** is assigned to ships specially equipped with fixed installations and/or mobile equipment for the removal of oil from the sea surface and its retention on board, carriage and subsequent unloading. The additional requirements of Ch 4, Sec 8, [9] and Part E, Chapter 5 are applicable to these ships.

The service notation may be completed by the following additional service features, as applicable:

- **OILTREAT** may be assigned to ships designed and equipped to recover polluted water which is subjected to a chemical and/or a physical treatment, in order to separate the oil from the polluted water. The separated oil is to be stored and transported in dedicated tanks
- **SECOND-LINE** may be assigned to ships designed and equipped to recover polluted water in the event of spills of oils which have, at the time of recovery, a flash point exceeding 60°C (closed cup test). This service feature is not to be assigned to oil recovery ships carrying heated recovered oils within 15°C of their flash point.

##### 4.11.5 Diving support

The following service notations are assigned to units specially intended for support of diving operation:

- a) **Diving support-integrated**, for ships and units having a permanent diving system installed
- b) **Diving support-capable**, for ships and units having a non-permanent diving system and when the diving equipment is not installed

- c) **Diving support-portable**, for ships and units having a non-permanent diving system and when the diving equipment is installed.

The requirements for the assignment of these service notations are given in Part E, Chapter 7.

The service notations **diving support-integrated** and **diving support-portable** are to be completed by the following additional service features:

- a) **DD**, when the ship is equipped with a deep diving system
- b) **SD**, when the ship is equipped with a shallow diving system.

The additional requirements of Ch 4, Sec 8, [13] are applicable to ships or units assigned with the service notations **diving support-integrated** or **diving support-portable**.

Note 1: The classification of the diving support units and the classification of the diving systems are independent. The diving systems are covered by NR610, Rules for the Classification of Diving Systems.

Note 2: For non-permanent diving systems, the notation **diving support-capable** is to be replaced by the temporary notation **diving support-portable** before conducting any diving operations. To this end, requirements of Part E, Chapter 7 are to be fulfilled allowing the service to become fully effective.

## 4.12 Offshore service vessels

### 4.12.1 General

The following service notations are assigned to ships or units specially intended for offshore operations:

- **offshore construction barge** ( ), as defined in [4.12.2]
- **offshore construction vessel** ( ), as defined in [4.12.3]
- **offshore support vessel** ( ), as defined in [4.12.4]

with between brackets the relevant combined service notations defined in [4.10.2], [4.11] and [4.12.5] to [4.12.10].

The service notations **offshore construction barge**, **offshore construction vessel** and **offshore support vessel** are always associated with one or several other service notation(s) listed in [4.12.5] to [4.12.10] and as indicated in [4.12.2], [4.12.4] and [4.12.3].

The service notations listed in [4.12.5] to [4.12.10] are not considered as stand-alone service notations and can not be granted without being associated with one of the following service notation: **offshore construction barge**, **offshore construction vessel** and **offshore support vessel**.

Ships assigned with service notation **offshore construction barge**, **offshore construction vessel** or **offshore support vessel** and fitted with legs complying with Pt E, Ch 8, Sec 7, are eligible for the assignment of the additional service feature **self elevating**.

The service notations **offshore construction barge** or **offshore construction vessel** may be completed by - **wind turbine installation** for ships intended to operate in wind farms.

### 4.12.2 Offshore construction barge

The service notation **offshore construction barge** is assigned to non-propelled units intended to perform construction operation offshore.

The service notation is to be completed with, between brackets and separated by a semicolon, one or several of the following service notations and their relevant additional service feature:

- **accommodation** (as defined in [4.12.5])
- **lifting** (as defined in [4.12.6])
- **pipe laying** (as defined in [4.12.7]).

The service notation **offshore construction barge** is to be complete by the additional service feature -**no propulsion** defined in [4.16.1].

Offshore construction barges fitted with legs are granted with the additional service feature **self elevating**, when found in compliance with the relevant requirements of Pt E, Ch 8, Sec 7. The requirements for the maintenance of the notation are given in NR445 Rules for the Classification of Offshore Units, Part A, Chapter 2, as applicable.

Offshore construction barges dedicated to wind turbine installation operations may be assigned with the additional service feature - **wind turbine installation**.

Example: **offshore construction barge (accommodation SP150; lifting) -no propulsion**.

Table 2 : List of service notations and additional service features for offshore service vessels

Service notation [ref. in Part A] Additional service feature	Associated service notation [ref. in Part A] Additional service feature	Reference Reference	
offshore construction barge [4.12.2]	accommodation [4.12.5] SPxxx or SPxxx-capable MOU	Part E, Chapter 11	
	lifting [4.12.6]	Part E, Chapter 8	
	pipe laying [4.12.7]	Part E, Chapter 12	
offshore construction vessel [4.12.3]	accommodation [4.12.5] SPxxx or SPxxx-capable MOU	Part E, Chapter 11	
	cable laying [4.12.8] (1)	Part E, Chapter 6	
	diving support-integrated [4.11.5] diving support-capable [4.11.5] diving support-portable [4.11.5] DD or SD	Part E, Chapter 7	
	lifting [4.12.6]	Part E, Chapter 8	
	pipe laying [4.12.7]	Part E, Chapter 12	
	offshore support vessel [4.12.4]	accommodation [4.12.5] SPxxx or SPxxx-capable MOU	Part E, Chapter 11
offshore support vessel [4.12.4]	anchor handling [4.11.2]	Part E, Chapter 2	
	diving support-integrated [4.11.5] diving support-capable [4.11.5] diving support-portable [4.11.5] DD or SD	Part E, Chapter 7	
	fire-fighting [4.11.3] (1) 1, 2, 3 or E water spraying	Part E, Chapter 4 Pt E, Ch 4, Sec 3 Pt E, Ch 4, Sec 4	
	lifting [4.12.6]	Part E, Chapter 8	
	oil recovery [4.11.4] OILTREAT SECOND-LINE	Part E, Chapter 5	
	standby rescue [4.12.9] number of survivors ship operation area	Part E, Chapter 10	
	supply [4.12.10] (1) HNLS or WELLSTIM (2)	Part E, Chapter 3	
	tug [4.10] (1) (design bollard pull = $[T_{BP}/9,81]$ t) (standardized design bollard pull = $[T_{BP}/9,81]$ t)	Part E, Chapter 1 Pt E, Ch 1, Sec 1	
	ADDITIONAL SERVICE FEATURES (3)		
	no propulsion [4.16.1] (4)		Part D, Chapter 14
	self elevating [4.12.2], [4.12.3] or [4.12.4]		Pt E, Ch 8, Sec 7
	wind turbine installation [4.12.2], [4.12.3] or [4.12.4] (5)		
	SRTP [4.16.8] (6)		Part D, Chapter 11
<p>(1) For ships granted with the service notation <b>cable laying</b>, <b>fire-fighting</b>, <b>supply</b> or <b>tug</b>, the corresponding type of ship according to SOLAS (Reg 1/2(g)) may be cargo ship.</p> <p>(2) May be completed by the following notation(s): - <b>FP</b> ≤ 60°C, - <b>toxic</b>, - <b>acids</b>, - <b>LG</b>.</p> <p>(3) Other additional service features as listed in Tab 1 may be assigned to offshore service vessels.</p> <p>(4) Only for service notation <b>offshore construction barge</b>.</p> <p>(5) Only for service notation <b>offshore construction barge</b> and <b>offshore construction vessel</b>.</p> <p>(6) Only completing the additional service feature <b>SPxxx</b>, when conditions are met as defined in [4.16.8].</p>			

#### 4.12.3 Offshore construction vessel

The service notation **offshore construction vessel** is assigned to ship-shaped, self-propelled units intended to perform construction operations at sea.

The service notation is to be completed with, between brackets and separated by a semicolon, one or several of the following service notations and their relevant additional service feature:

- **accommodation** (as defined in [4.12.5])
- **cable laying** (as defined in [4.12.8])
- **diving support** (as defined in [4.11.5])
- **lifting** (as defined in [4.12.6])
- **pipe laying** (as defined in [4.12.7]).

Offshore construction vessels fitted with legs are granted with the additional service feature **self elevating**, when found in compliance with the relevant requirements of Pt E, Ch 8, Sec 7. The requirements for the maintenance of the notation are given in NR445 Rules for the Classification of Offshore Units, Part A, Chapter 2, as applicable.

Offshore construction vessels dedicated to wind turbine installation operations may be assigned with the additional service feature - **wind turbine installation**.

Example: **offshore construction vessel (lifting ; diving support integrated - DD) - wind turbine installation**.

#### 4.12.4 Offshore support vessel

The service notation **offshore support vessel** is assigned to ship-shaped, self-propelled units intended to perform inspection, maintenance, repair or supply operations for an offshore installation.

The service notation is to be completed with, between brackets and separated by a semicolon, one or several of the following service notations and their relevant additional service feature:

- **accommodation** (as defined in [4.12.5])
- **anchor handling** (as defined in [4.11.2])
- **diving support** (as defined in [4.11.5])
- **fire-fighting** (as defined in [4.11.3])
- **lifting** (as defined in [4.12.6])
- **oil-recovery** (as defined in [4.11.4])
- **standby and rescue** (as defined in [4.12.9])
- **supply** (as defined in [4.12.10])
- **tug** (as defined in [4.10.2]).

Offshore support vessels fitted with legs are granted with the additional service feature **self elevating**, when found in compliance with the relevant requirements of Pt E, Ch 8, Sec 7. The requirements for the maintenance of the notation are given in NR445 Rules for the Classification of Offshore Units, Part A, Chapter 2, as applicable.

Example: **offshore support vessel (supply HNLS; fire-fighting 2; oil recovery OILTREAT) self elevating**.

#### 4.12.5 Accommodation unit

In compliance with [4.12.2], [4.12.3] and [4.12.4] the service notation **accommodation** is assigned to ships intended to accommodate personnel working offshore.

This service notation is always completed by at least one of the following additional service feature when the ship complies with IMO Code of Safety for Special Purpose Ships carrying more than twelve (12) special personnel:

- **SPxxx**, when accommodation facilities are permanently installed on board and where **xxx** is the total number of persons on board, as defined in [4.16.8]
- **SPxxx-capable**, when accommodation facilities may be added as separate modules during the service life of the ship and where **xxx** is the total number of persons on board once the modules have been added, as defined in [4.16.8].

For ships granted with **SPxxx** and **SPxxx-capable** together, when modules are added or removed, the service features have to be adjusted accordingly. For example, for a ship granted with **SP100** and **SP200-capable**, when adding modules for 50 persons, the service features have then to be modified for **SP150** and **SP200-capable** or, when adding modules for 100 persons, **SP200** only.

For ships granted with **SPxxx-capable** only, when adding modules, the service features have to be adjusted accordingly. For example, for ship granted with **SP100-capable**, when adding modules for 50 persons, the service features have then to be modified for **SP50** and **SP100-capable** or, when adding modules for 100 persons, **SP100** only.

This service notation may be completed by the additional service feature **MOU** when the ship is complying with the requirements of the MODU Code, as defined in Pt E, Ch 11, Sec 1.

The requirements for the assignment of this notation are given Part E, Chapter 11.

#### 4.12.6 Lifting unit

In compliance with [4.12.2], [4.12.3] and [4.12.4], the service notation **lifting** is assigned to ships or unit intended to perform lifting operations at sea, engaged in an operation involving the raising or lowering of objects using vertical force by means of winches, cranes, A-frames or other lifting devices.

The requirements for the assignment and maintenance of this notation are given respectively in Part E, Chapter 8 and in Ch 4, Sec 8, [12].

Note 1: The service notation **lifting** can only be granted to the ship if the corresponding lifting unit is covered by at least one of the additional class notations **ALM** or **OHS**.

#### 4.12.7 Pipe laying unit

In compliance with [4.12.3] the service notation **pipe laying** is assigned to ships fitted with equipment used for assembling and installing rigid or flexible pipelines to the seabed.

The requirements for the assignment and maintenance of this notation are given respectively in Part E, Chapter 12 and in Ch 4, Sec 8, [19].

#### 4.12.8 Cable laying ship

In compliance with [4.12.3] the service notation **cable laying** is assigned to ships specially equipped for the carriage and/or laying, hauling and repair of submarine cables. The additional requirements of Ch 4, Sec 8, [11] and Part E, Chapter 6 are applicable to these ships.

#### 4.12.9 Standby and rescue vessel

In compliance with [4.12.4], ships complying with the requirements of Part E, Chapter 10 are eligible for the assignment of the service notation **standby rescue**.

This service notation is to be completed by the number of survivors that the vessel is intended to carry, as for example: **standby rescue (150 survivors)**.

Depending on the vessel operation area, the Society may adapt the requirements regarding the survivors accommodation and/or the safety equipment. In such a case, this service notation is to be also completed by the vessel operation area, as for example: **standby rescue (150 survivors, Guinea Gulf)**.

The additional requirements of Ch 4, Sec 8, [15] are applicable to these ships.

#### 4.12.10 Supply vessel

In compliance with [4.12.4] the service notation **supply** is assigned to ships intended to support offshore operations by carrying deck cargoes and oil products (MARPOL Annex 1) in bulk with flash point not less than 60°C, cement, dry mud and non-hazardous liquid mud in underdeck tanks.

Where applicable, the service notation **supply** is to be completed by one or several of the following additional service features:

- **WELLSTIM**, for well stimulation vessels
- **HNLS**, for ships, other than well stimulation vessels, carrying hazardous and noxious substances in bulk for the servicing and resupplying of offshore platforms, mobile offshore drilling units and other offshore installations, including those employed in the search for and recovery of hydrocarbons from the sea-bed.

The additional service features **HNLS** and **WELLSTIM** are to be completed by one or several of the following notations when carriage of products mentioned below is considered:

- **-FP≤60°C**: when ship may carry products with a flash point equal to or less than 60°C
- **-toxic**: when ship may carry toxic products
- **-acids**: when ship may carry acid products.
- **-LG**: when ship may carry liquid carbon dioxide and liquid nitrogen.

The additional requirements of Ch 4, Sec 8, [7] and Part E, Chapter 3 are applicable to these ships.

### 4.13 Ships for dredging activities

4.13.1 Ships specially intended for dredging activities are assigned the following service notations:

- **dredger**, for ships specially equipped only for dredging activities (excluding carrying dredged material)
- **hopper dredger**, for ships specially equipped for dredging activities and carrying spoils or dredged material
- **hopper unit**, for ships specially equipped for carrying spoils or dredged material
- **split hopper unit**, for ships specially equipped for carrying spoils or dredged material and which open longitudinally, around hinges
- **split hopper dredger**, for ships specially equipped for dredging and for carrying spoils or dredged material and which open longitudinally, around hinges.

These ships are to be granted not less than one of the operating area notation defined in [5.3.2]. For the definition of operating area notation, reference is to be made to [5.3].

The additional service feature **EOC** (Enhanced Operating Conditions) is granted to:

- ships greater than 90 m in length and assigned the service notation **dredger**
- ships greater than 65 m in length and assigned one of the service notation **hopper dredger, hopper unit, split hopper dredger** or **split hopper unit**

when specific fatigue calculations are performed, according to the applicable requirements of Pt D, Ch 13, Sec 2, to allow enhanced operational limits, unless no operating area notation other than **unrestricted dredging area (T = x m)** as defined in [5.3.2], is assigned.

The additional requirements of Ch 4, Sec 8, [5] and Part D, Chapter 13 are applicable to these ships.

### 4.14 Barge and pontoon

#### 4.14.1 Barge

The service notation **barge** is assigned to non-propelled units intended to carry, inside holds or tanks, dry or liquid cargo except liquefied gases or other substances listed in Pt D, Ch 9, Sec 1.

The additional requirements of Part D, Chapter 14 are applicable to these ships.

For ships intended to carry only one type of cargo, the service notation may be completed by an additional service feature indicating the type of product carried e.g. **barge - oil, barge - general cargo, barge - chemical**.

This service notation may be completed by the additional service feature **tug combined** when the units are designed to be connected with tugs and comply with the relevant requirements of Pt E, Ch 1, Sec 4. The tugs to which the barge can be connected are specified in a memorandum.

#### 4.14.2 Pontoon

The service notation **pontoon** is assigned to non-propelled units intended to carry cargo and/or equipment on deck only. When a crane is permanently fitted on board, the crane is to be certified and the service notation **pontoon - crane** is granted. The additional requirements of Part D, Chapter 14 are applicable to these ships.

### 4.15 Miscellaneous units

#### 4.15.1 Special service

The service notation **special service** is assigned to ships which, due to the peculiar characteristics of their activity, are not covered by any of the notations mentioned above. The classification requirements of such units are considered by the Society on a case by case basis.

This service notation may apply, for instance, to ships engaged in research, expeditions and survey, ships for training of marine personnel, whale and fish factory ships not engaged in catching, ships processing other living resources of the sea, and other ships with design features and modes of operation which may be referred to the same group of ships.

An additional service feature may be specified after the notation (e.g. **special service-training, special service-fish factory**) to identify the particular service in which the ship is intended to trade. The scope and criteria of classification of such units are indicated in a memorandum.

#### 4.15.2 Launch

The launches or motorboats with a length not exceeding 24 m and meeting the requirements of both NR566 Hull Arrangement, Stability and Systems for Ships less than 500 GT and NR600 Hull Structure and Arrangement for the Classification of Cargo Ships less than 65 m and Non Cargo Ships less than 90 m are assigned the following service notations:

- **seagoing launch**, for units intended for seagoing service, limited at a wind force not exceeding 6 Beaufort scale
- **launch**, for units intended for operation in ports, roadsteads, bays and generally calm stretches of water, limited at a wind force not exceeding 4 Beaufort scale.

Note 1: Ships that are assigned the service notation **launch** or **seagoing launch** are not assigned a navigation notation.

#### 4.15.3 Yacht and charter yacht

The service notation **yacht** or **charter yacht** is assigned to ship intended for pleasure cruising, as follows:

- **yacht**, when the ship is not engaged in trade
- **charter yacht**, when the ship is engaged in trade.

The service notation **yacht** or **charter yacht** is always completed by one of the following additional service features, as applicable:

- **motor** for units propelled by propulsion engine
- **sailing** for units with a sail propulsion, including those assisted by auxiliary propulsion engine.

Examples:

**yacht-motor**

**yacht-sailing**

**charter yacht-motor**

### **charter yacht-sailing**

The service notation **yacht** or **charter yacht** is always completed by one of the additional service feature, as applicable:

- **S** when the hull is made of steel material
- **C** when the hull is made of composite material
- **A** when the hull is made of aluminium
- **W** when the hull is made of wood material.

Example:

#### **yacht-motor-S**

The requirements for the assignment of these notations are given in NR500, Rules For The Classification and the Certification of Yachts.

The requirements for the maintenance of these notations are given in NR500, Rules For The Classification and the Certification of Yachts and in Ch 4, Sec 8, [16].

In accordance with NR206, upon request, the additional service feature **WIND PROPULSION-1** or **WIND PROPULSION-2** may be assigned in addition to the additional service feature **sailing**. The requirements for the assignment and maintenance of these additional service features are given respectively in NR206 and Ch 4, Sec 12.

#### **4.15.4 Crew boats**

The service notation **crew boat** is assigned to ships less than 500 GT, dedicated to transport of offshore personnel from harbours to moored offshore installations or ships, proceeding in the course of their voyage not more than four hours at operational speed from a place of refuge, and meeting the requirements of NR490, Rules for the Classification of Crew Boats.

Ships which do not fulfil the minimum speed criteria given in NR490, Sec 1, [1], are not to be assigned the above service notation.

These ships which are likely to operate at sea within specific limits may, under certain conditions, be granted an operating area notation. For the definition of operating area notation, reference should be made to [5.3].

#### **4.15.5 Wind farms service ship**

The service notation **wind farms service ship - Xi** is intended to cover ships specifically designed to operate in offshore wind farms for the typical following duties:

- transfer of personnel from shore to offshore wind farms or from mother ships or accommodation units at site to offshore wind farms
- lifting operations required for wind turbines assistance (transfer of materials on wind turbines platforms).

The service notation is to be completed by the additional service feature **Xi**, where:

**X** : Capacity parameter having one of the following values: **S**, **M**, or **L**

**i** : Type ship parameter having one of the following values: **0**, **1** or **2**.

The requirements for the assignment of this service notation are given in the NR589 Wind Farms Service Ships.

#### **4.15.6 Floating dock**

The service notation **floating dock** is assigned to floating docks meeting the requirements of NR475.

Note 1: The navigation notation **sheltered area** is assigned to these units. When the dock is intended to be towed, the navigation notation **temporary unrestricted navigation** is also to be assigned.

#### **4.15.7 Compressed natural gas carrier**

The service notation **compressed natural gas carrier** is assigned to ships intended to carry compressed natural gas (CNG) meeting the requirements of NR517 Classification of Compressed Natural Gas Carriers.

#### **4.15.8 FSRUs and FSUs**

The requirements for the assignment of a service notation for Floating Storage Regasification Units (FSRUs) and Floating gas Storage Units (FSUs) are given in NR645 Rules for the Classification of Floating Storage Regasification Units and Floating gas Storage Units.

The following service notations may be assigned to FSRUs and FSUs, as relevant:

- **liquefied gas carrier - FSRU**, when the floating unit is designed to operate as a regasification unit with the possibility of trading LNG in a navigation mode
- **liquefied gas carrier - FSU**, when the floating unit is designed to operate as a storage unit with the possibility of trading LNG in a navigation mode
- **FSRU**, when the floating unit is designed to operate as a regasification unit permanently moored without trading LNG
- **FSU-LNG**, when the floating unit is designed to operate as a storage unit permanently moored without trading LNG.

Note 1: Typical notations to be assigned to complete the service notations are described in NR645.

These service notations are to be completed by the additional service feature ([**cargo type**], [**ship type - IGC Code**], [**cargo tank design pressure**], [**minimum temperature**]) as defined in [4.4.5].

The requirements for the maintenance of these notations are given in NR645 and in:

- Ch 4, Sec 5, for units granted with **liquefied gas carrier - FSRU** or **liquefied gas carrier - FSU** notation
- NR445 Rules for the Classification of Offshore Units, for units granted with **FSRU** or **FSU-LNG** notation,

as applicable.

### 4.15.9 Unmanned surface vessel (USV)

The service notation **USV** is assigned to unmanned surface units.

The type of service is to be specified after the service notation.

Example: **USV /hydrographic survey ship**

The scope of application and the requirements for the assignment of this service notation are given in NR681 Rules for Unmanned Surface Vessels (USV).

### 4.15.10 Other units

For ships or other floating units intended to be classed with other service notations, reference is to be made to the specific Rules of the Society, and in particular:

- Rules for the Classification of Naval Ships (NR483)
- Rules for the Classification of Offshore Units (NR445)

### 4.15.11 Inland navigation vessels

For ships and units intended for navigation in inland waters, reference is to be made to the Rules for the Classification of Inland Navigation Vessels (NR217).

## 4.16 Miscellaneous service features

### 4.16.1 Non-propelled units

Any non-propelled units other than those covered by the service notations listed in [4.14.1] and [4.14.2] will be assigned the additional service feature **no propulsion**, to be added to their own service notation, e.g. **dredger - no propulsion**.

### 4.16.2 Assisted propulsion units

Any units having a propulsion system not enabling them to proceed at a speed greater than 7 knots, used for short transit voyages, will be assigned the additional service feature **assisted propulsion** to be added to their own service notation, e.g. **dredger - assisted propulsion**.

### 4.16.3 Ships with wind propulsion systems

Ships equipped with a wind propulsion system as defined in NR206, Sec 1, [2.1], and assigned a service notation other than **yacht** or **charter yacht**, are to be assigned one of the following additional service features:

- **WIND PROPULSION-1** when the safety rigging parts of the wind propulsion system are included in the scope of classification
- **WIND PROPULSION-2** when both the safety and the operating rigging parts of the wind propulsion system are included in the scope of classification.

The requirements for the assignment of these notations are given in NR206, Wind Propulsion Systems.

The requirements for the maintenance of these notations are given in Ch 4, Sec 12.

Note 1: The safety rigging parts and operating rigging parts are defined in NR206 Sec 1 [2.2].

### 4.16.4 Ships with low flashpoint liquid or gas fuelled propulsion

The service notation is to be completed by one or more of the following additional service features, as applicable:

- **LNGFuel**, for ships fitted with engines, fuel cells or gas turbines using natural gas as fuel, stored in liquefied form
- **CNGFuel**, for ships fitted with engines, fuel cells or gas turbines using compressed natural gas as fuel
- **LPGFuel**, for ships fitted with engines, fuel cells or gas turbines using petroleum gas as fuel, in liquefied or gaseous form
- **methanolfuel**, for ships fitted with engines, fuel cells or gas turbines using methanol as fuel
- **ammoniafuel**, for ships fitted with engines, fuel cells or gas turbines using ammonia as fuel
- **hydrogenfuel**, for ships fitted with engines, fuel cells or gas turbines using hydrogen as fuel
- **LFPFuel**, for ships fitted with engines, fuel cells or gas turbines using a low flashpoint fuel different from the fuels mentioned above.

Note 1: Natural gas means gaseous mixture consisting mainly of methane and which may also contain smaller amounts of ethane, propane and butane.

Note 2: Petroleum gas means gaseous mixture consisting mainly of propane and butane.

Each additional service feature is to be completed by one of the following notations:

- **singlefuel** for ships fitted with engines, fuel cells or gas turbines using only the fuel considered
- **dualfuel** for ships fitted with engines or gas turbines using both the fuel considered and fuel oil.

The notations **singlefuel** or **dualfuel** may be completed by:

- **-aux**, when the ship uses the fuel considered only for the generating set
- **-prop**, when the ship uses the fuel considered only for the propulsion system.

Note 3: **-aux** and **-prop** are not added to **singlefuel** or **dualfuel** when both auxiliaries and propulsion are using the same fuel considered.

The requirements for the assignment of these additional service features are given in:

- Pt D, Ch 9, Sec 1, [1.1.6] for gas carriers
- NR529 Gas-fuelled Ships
- NI647 LPG-fuelled Ships
- NR670 Methanol & Ethanol-fuelled Ships
- NR671 Ammonia-fuelled Ships
- NR678 Hydrogen-fuelled Ships.

The additional requirements of Ch 4, Sec 9 are applicable to these ships, except gas carriers using their cargo as fuel, for which the applicable requirements are given in Ch 4, Sec 5.

The additional service feature **LFPfuel** is assigned to ships fitted with engines, fuel cells or gas turbines using a low flashpoint liquid fuel or gas different from the fuels mentioned above when this has been specially considered by the Society.

Examples:

**CNGfuel singlefuel -prop**

**ammoniafuel dualfuel**

**methanolfuel dualfuel -aux LNGfuel singlefuel -prop**

Subject to compliance with the requirements of [4.16.5], the above additional service features are completed with **fuelcell**, when the ship is fitted with a fuel cell system.

#### 4.16.5 Ships fitted with a fuel cell power installation

The additional service feature **fuelcell** is to be assigned to ships fitted with a fuel cell power installation.

The requirements for the assignment and the maintenance of this additional service feature are given respectively in NR547 Ship using Fuel Cells and in Ch 4, Sec 10.

Prior to the assignment of the additional service feature **fuelcell** and with respect to the primary fuel considered, granting of at least one of the additional service feature listed in [4.16.4] is mandatory.

The primary fuel or fuels used by the fuel cell are to be indicated in a memorandum.

Examples:

**LNGfuel dualfuel fuelcell**

**LFPfuel singlefuel -aux fuelcell**

The additional requirements of Ch 4, Sec 9 are applicable to these ships, except gas carriers using their cargo as fuel, for which the applicable requirements are given in Ch 4, Sec 5.

#### 4.16.6 Tier III

The additional service feature **Tier III** is assigned to ships for which the main engine and auxiliary engines are issued with an EIAPP certificate (Engine International Air Pollution Prevention Certificate) stating compliance with Tier III according to the applicable Marpol Convention requirements.

#### 4.16.7 Elastic shaft alignment for line shafting and structure compatibility

The additional service feature **ESA** is to be assigned to new ships designed with propulsion shaft line(s) falling into the categories as defined in NR592 Elastic Shaft Alignment (ESA).

The criteria and requirements for the assignment of this additional service feature are given in NR592.

#### 4.16.8 Special purpose ships (SPxxx)

Ships complying with the IMO Code of Safety for Special Purpose Ships carrying more than twelve (12) special personnel are to be assigned the additional service feature **SPxxx**, where **xxx** is the total number of persons onboard including crew, special personnel and passengers (maximum twelve).

The requirements for the assignment of this additional service feature consist of:

- the general requirements of the present Rules, and
- the additional requirements given in:
  - Pt B, Ch 2, Sec 1; Pt B, Ch 2, Sec 2; Pt B, Ch 3, Sec 1; Pt B, Ch 3, Sec 3 and Pt B, Ch 3, App 2 for stability
  - Pt C, Ch 1, Sec 10 and Pt C, Ch 1, Sec 14 for machinery and systems
  - Pt C, Ch 2, Sec 3 for electrical installations and automation, and
  - Pt C, Ch 4, Sec 1 for fire protection, detection and extinction.

The additional service feature **SPxxx** is to be completed by the additional service feature **SRTP** when:

- **xxx** is greater than 240 and
- $L_{LL}$  as defined in Pt B, Ch 1, Sec 3, [2.1.2] is greater than or equal to 120 m or the ship includes three or more main vertical zones as defined in Pt C, Ch 4, Sec 1, [2.30].

### 4.16.9 Ships operating in polar waters

The following additional service features are assigned to ships which are in compliance with the corresponding ship category according to the IMO International Code for Ships Operating in Polar Waters (Polar Code):

- **POLAR CAT-A** for ships defined as “Category A” ships in respect of the IMO International Code for Ships Operating in Polar Waters
- **POLAR CAT-B** for ships defined as “Category B” ships in respect of the IMO International Code for Ships Operating in Polar Waters
- **POLAR CAT-C** for ships defined as “Category C” ships in respect of the IMO International Code for Ships Operating in Polar Waters.

The requirements for the assignment of these additional service features are detailed in NR527, Rules for the Classification of Ships Operating in Polar Waters and Icebreakers.

### 4.16.10 Carriage of heavy cargo

When the double bottom and/or hatch covers and/or other cargo areas designed to support heavy cargoes fulfil the appropriate rule requirements, the additional service feature **heavycargo** [**AREA1, X1 kN/m<sup>2</sup> - AREA2, X2 kN/m<sup>2</sup> - ...**] may complete the service notation of a ship. The values  $X_i$  indicate the maximum allowable local pressures on the various zones  $AREA_i$  where the cargo is intended to be stowed.

The requirements for the assignment of this additional service feature are given in Pt B, Ch 5, Sec 6, [6.1.2].

### 4.16.11 Coating performance standard

The additional service feature **CPS(WBT)** is assigned to the following ships:

- bulk carriers assigned with the additional service feature **CSR** and contracted for construction on or after 8 December 2006, for which the rule requirements of NR530 Coating Performance Standard, applicable to ships complying with the requirements of the Common Structural Rules for Bulk Carriers or the Common Structural Rules for Double Hull Oil Tankers and related to protective coatings in dedicated seawater ballast tanks of ships of not less than 500 gross tonnage and double-side skin spaces arranged in bulk carriers of length greater than or equal to 150 m, are applied
- oil tankers assigned with the additional service feature **CSR** and contracted for construction on or after 8 December 2006, for which the rule requirements of NR530 Coating Performance Standard, applicable to ships complying with the requirements of the Common Structural Rules for Bulk Carriers or the Common Structural Rules for Double Hull Oil Tankers and related to protective coatings in dedicated seawater ballast tanks of ships of not less than 500 gross tonnage and double-side skin spaces arranged in bulk carriers of length greater than or equal to 150 m, are applied
- ships complying with IMO resolution MSC.215(82), as amended, and contracted for construction on or after 1 July 2008.

Note 1: For other ships complying with the requirements of NR530 Coating Performance Standard, reference is made to [6.24.4] for the possible assignment of the additional class notation **CPS(WBT)**.

### 4.16.12 Power generation

The additional service features:

- **POWERGEN(OIL)**
- **POWERGEN(LNG/NG)**
- **POWERGEN(DUALFUEL)**

are assigned to units fitted with power generation equipment to serve as a power generation resource.

The requirements for the assignment of these additional service features are given in NR656.

### 4.16.13 Computerized systems

The additional service feature **SW-Registry** is assigned to ships contracted for construction on or after 1st July 2017, provided with a software registry meeting the related requirements laid down in Pt C, Ch 3, Sec 3 for the assignment and those laid down in Ch 3, Sec 1 and Ch 3, Sec 3 for the maintenance of the software registry.

This additional service feature **SW-Registry** is assigned to existing ships provided with a software registry in compliance with the related requirements laid down in Pt C, Ch 3, Sec 3; requirements for the maintenance of the notation are indicated in Ch 3, Sec 1 and Ch 3, Sec 3.

### 4.16.14 Condition based maintenance

The additional service features **CBM** and **[CBM]** are assigned to ships where a Planned Maintenance Survey system for machinery (PMS) is implemented and on which at least one machinery item is to be surveyed under a Condition Based Maintenance scheme, according to the requirements of Ch 2, Sec 2, [4.4] and Ch 2, App 4.

The additional service feature **[CBM]** is assigned to ships after the Owner's application for the CBM scheme has been received by the Society.

The additional service feature **[CBM]** is replaced by **CBM** when the implementation survey is carried out and found satisfactory, in accordance with Ch 2, App 4, [3.2].

Consideration may be given by the Society, on a case by case basis, to withdraw **[CBM]** in case of significant delay for the Owner's request for the installation survey.

Note 1: See NI684 "Guideline for Condition Based Maintenance" for further details on requirements and class workflow.

The requirements for the assignment and maintenance of these additional service features are given in Ch 2, App 4.

### 4.16.15 Onboard carbon capture and storage system (OCC)

The additional service feature **OCC** is to be assigned to ships fitted with a carbon capture and storage (CCS) system intended to separate the carbon dioxide (CO<sub>2</sub>) from the ship engine exhaust gases and store it on board.

The requirements for the assignment and maintenance of this additional service feature are given respectively in Pt C, Ch 1, Sec 12 and Ch 4, Sec 11.

## 5 Navigation and operating area notations

### 5.1 Navigation notations

**5.1.1** Every classed ship is to be assigned one navigation notation as listed in [5.2], except those with the service notations **launch** or **seagoing launch**.

**5.1.2** The assignment of a navigation notation, including the reduction of scantlings or specific arrangements for restricted navigation notations, is subject to compliance with the requirements laid down in Part B, Part C, Part D and Part E of the Rules and in NR216 Materials and Welding.

**5.1.3** The assignment of a navigation notation does not absolve the Interested Party from compliance with any international and national regulations established by the Administrations for a ship operating in national waters, or a specific area, or a navigation zone. Neither does it waive the requirements in Ch 1, Sec 1, [3.3.1].

### 5.2 List of navigation notations

**5.2.1** The navigation notation **unrestricted navigation** is assigned to a ship intended to operate in any area and any period of the year.

**5.2.2** The navigation notation **summer zone** is assigned to ships intended to operate only within the geographical limits as defined in ILLC 1966 for the Summer zones.

**5.2.3** The navigation notation **tropical zone** is assigned to ships intended to operate only within the geographical limits as defined in ILLC 1966 for the Tropical zones.

**5.2.4** The navigation notation **coastal area** is assigned to ships intended to operate only within 20 nautical miles from the shore and with a maximum sailing time of six hours from a port of refuge or safe sheltered anchorage.

**5.2.5** The navigation notation **sheltered area** is assigned to ships intended to operate in sheltered waters, i.e. harbours, estuaries, roadsteads, bays, lagoons and generally calm stretches of water and when the wind force does not exceed 6 Beaufort scale.

**5.2.6** In specific cases, the designation of the geographical area and/or the most unfavourable sea conditions considered may be added to the navigation notation.

**5.2.7** The navigation notation **temporary unrestricted navigation** may be assigned, in addition to the navigation notations defined in [5.2.2], [5.2.3], [5.2.4] and [5.2.5] to service ships for which the period of unrestricted navigation may be chosen to satisfy the conditions defined in a memorandum.

When a favourable weather situation is included amongst these conditions, the voyages are to be such as the ship can be put in a port or a sheltered anchorage in about 12 hours from any point of its route.

Note 1: Before any voyage covered by the navigation notation **temporary unrestricted navigation**, the ship is to be submitted to an occasional survey, during which the Surveyor checks that the intended voyage and the ship's specific condition, if any, comply with the conditions defined in a memorandum.

**5.2.8** For ships assigned with the service notation:

- **HSC-CAT A**, **HSC-CAT B**, or **HSC** as defined in [4.6.1]
- **light ship**, as defined in [4.6.2], or
- **crew boat**, as defined in [4.15.4]
- **wind farm service ship - X0**, as defined in [4.15.5],

as a rule, one of the following navigation notations is to be assigned to such units and is corresponding to sea areas where the significant wave height H.S. is not to exceed for more than 10 per cent of the year the following values:

- **sea area 1:** 0,5 m
- **sea area 2:** 2,5 m
- **sea area 3:** 4,0 m
- **sea area 4:** no limitation.

The shipyard’s table of the maximum allowed ship speed relative to the sea states, characterised by their significant wave height, is indicated in a memorandum.

**5.3 Operating area notations**

**5.3.1** The operating area notation expresses the specified area where some service units are likely to operate at sea within specific restrictions which are different from normal navigation conditions.

The operating area notations defined in [5.3.2] are, in principle, solely granted to ships for dredging activities as defined in [4.13].

The operating area notations defined in [5.3.3] are, in principle, solely granted to tugs as defined in [4.10].

The operating area notation defined in [5.3.4] is, in principle, solely granted to crew boats, wind farms service ships and light ships as defined, respectively, in [4.15.4], [4.15.5] and [4.6.2].

This operating area notation is indicated after the navigation notation.

Example: **unrestricted navigation - “operating area notation”**

**5.3.2 Operating areas for ships intended for dredging activities**

At least one operating area notations is to be assigned to a unit granted with a service notation as specified in [4.13].

a) for units designed to operate specific dredging situations at sea without specific limits:

**unrestricted dredging area (T= x m)**

where (T= x m) indicates the maximum allowable draught x, in m, corresponding to the dredging situation, as defined in Pt D, Ch 13, Sec 2, [3.1.1].

example: **unrestricted dredging area (T= 5,00 m)**

b) for units designed to operate specific dredging situations at sea under specific limits:

- units which are not granted the additional service feature **EOC**: one or several notations for standard dredging conditions defined in Tab 3, as applicable
- units assigned with the additional service feature **EOC**: one or several notations for enhanced dredging conditions defined in Tab 4, as applicable.

**Table 3 : Operating area notation for standard dredging conditions under specific limits**

Ship length	Operational limits	Operating area notation
less or equal to 110 m	<ul style="list-style-type: none"> <li>• within 8 miles from shore</li> <li>• over 8 miles from shore with Hs ≤ 1,5 m</li> </ul>	<b>dredging ≤ 8 miles from shore or Hs ≤ 1,5 m (T= x m)</b>
	<ul style="list-style-type: none"> <li>• within 15 miles from shore</li> <li>• over 15 miles from shore with Hs ≤ 2,5 m</li> </ul>	<b>dredging ≤ 15 miles from shore or Hs ≤ 2,5 m (T= x m)</b>
more than 110 m and less or equal to 150 m	<ul style="list-style-type: none"> <li>• within 8 miles from shore</li> <li>• over 8 miles from shore with Hs ≤ 2,0 m</li> </ul>	<b>dredging ≤ 8 miles from shore or Hs ≤ 2,0 m (T= x m)</b>
	<ul style="list-style-type: none"> <li>• within 15 miles from shore</li> <li>• over 15 miles from shore with Hs ≤ 3,0 m</li> </ul>	<b>dredging ≤ 15 miles from shore or Hs ≤ 3,0 m (T= x m)</b>
more than 150 m	<ul style="list-style-type: none"> <li>• within 8 miles from shore</li> <li>• over 8 miles from shore with Hs ≤ 2,0 m</li> </ul>	<b>dredging ≤ 8 miles from shore or Hs ≤ 2,0 m (T= x m)</b>
	<ul style="list-style-type: none"> <li>• within 15 miles from shore</li> <li>• over 15 miles from shore with Hs ≤ 3,5 m</li> </ul>	<b>dredging ≤ 15 miles from shore or Hs ≤ 3,5 m (T= x m)</b>

**Note 1:**Hs is the maximum allowable significant wave height during the service.  
(T= x m) indicates the maximum allowable draught x, in m, corresponding to the dredging situation, as defined in Pt D, Ch 13, Sec 2, [3.1.1].  
example: **dredging ≤ 8 miles from shore or Hs ≤ 1,5 m (T= 4,50 m)**

**Table 4 : Operating area notation for enhanced dredging conditions under specific limits**

Operational limits	Operating area notation
<ul style="list-style-type: none"> <li>within 8 miles from shore</li> <li>over 8 miles from shore with <math>H_s \leq 1,0</math> m</li> </ul>	<b>dredging <math>\leq</math> 8 miles from shore or <math>H_s \leq 1,0</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 8 miles from shore</li> <li>over 8 miles from shore with <math>H_s \leq 1,5</math> m</li> </ul>	<b>dredging <math>\leq</math> 8 miles from shore or <math>H_s \leq 1,5</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 8 miles from shore</li> <li>over 8 miles from shore with <math>H_s \leq 2,0</math> m</li> </ul>	<b>dredging <math>\leq</math> 8 miles from shore or <math>H_s \leq 2,0</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 8 miles from shore</li> <li>over 8 miles from shore with <math>H_s \leq 2,5</math> m</li> </ul>	<b>dredging <math>\leq</math> 8 miles from shore or <math>H_s \leq 2,5</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 8 miles from shore</li> <li>over 8 miles from shore with <math>H_s \leq 3,0</math> m</li> </ul>	<b>dredging <math>\leq</math> 8 miles from shore or <math>H_s \leq 3,0</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 8 miles from shore</li> <li>over 8 miles from shore with <math>H_s \leq 3,5</math> m</li> </ul>	<b>dredging <math>\leq</math> 8 miles from shore or <math>H_s \leq 3,5</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 15 miles from shore</li> <li>over 15 miles from shore with <math>H_s \leq 2,5</math> m</li> </ul>	<b>dredging <math>\leq</math> 15 miles from shore or <math>H_s \leq 2,5</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 15 miles from shore</li> <li>over 15 miles from shore with <math>H_s \leq 3,0</math> m</li> </ul>	<b>dredging <math>\leq</math> 15 miles from shore or <math>H_s \leq 3,0</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 15 miles from shore</li> <li>over 15 miles from shore with <math>H_s \leq 3,5</math> m</li> </ul>	<b>dredging <math>\leq</math> 15 miles from shore or <math>H_s \leq 3,5</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 15 miles from shore</li> <li>over 15 miles from shore with <math>H_s \leq 4,0</math> m</li> </ul>	<b>dredging <math>\leq</math> 15 miles from shore or <math>H_s \leq 4,0</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 15 miles from shore</li> <li>over 15 miles from shore with <math>H_s \leq 4,5</math> m</li> </ul>	<b>dredging <math>\leq</math> 15 miles from shore or <math>H_s \leq 4,5</math> m (T= x m)</b>
<ul style="list-style-type: none"> <li>within 15 miles from shore</li> <li>over 15 miles from shore with <math>H_s \leq 5,0</math> m</li> </ul>	<b>dredging <math>\leq</math> 15 miles from shore or <math>H_s \leq 5,0</math> m (T= x m)</b>
<p><b>Note 1:</b> <math>H_s</math> is the maximum allowable significant wave height during the service.                      (T= x m) indicates the maximum allowable draught x, in m, corresponding to the dredging situation, as defined in Pt D, Ch 13, Sec 2, [3.1.1].                      example: <b>dredging <math>\leq</math> 15 miles from shore or <math>H_s \leq 3,0</math> m (T= 5,00 m)</b></p>	

**5.3.3 Operating areas for tugs**

The following operating area notations may be assigned:

- operating within 5 miles from shore for ships granted with the service notation **tug** or **escort tug** which are specially equipped to assist ships and/or floating units while entering or leaving port, within 5 miles from shore, and limited to operate from a single and fixed port.
- operating  $\leq$  4h from a place of refuge for ships granted with the service notation **tug** or **escort tug** which do not proceed in the course of their voyage for more than four hours at operational speed from any naturally or artificially sheltered area which may be used as a shelter by the tug under conditions likely to endanger its safety.
- escort service limited to non-exposed waters for ships granted with the service notation **escort tug** which are operating in non-exposed waters, where the environmental impact on the escort service is negligible. In general, waters are considered as non-exposed where the wind fetch is not more than 6 nautical miles and the significant wave height is not more than 1,0 m.

**5.3.4 Operating area for crew boats, wind farms service ships and light ships**

The following operating area notation may be assigned to ships with service notation **crew boat**, **wind farms service ships** or **light ship**:

- assisted operating area for ships operating within an area where it has been demonstrated to the satisfaction of the Society that there is a high probability that in the event of an evacuation at any point of the route, all passengers and crew can be rescued safely within 4 hours. For ships operating in harsh environmental conditions, a reduced time of rescue may be required to the satisfaction of Society.

The operating area is to be specified by the party applying for classification and is to be indicated in a memorandum.

## 6 Additional class notations

### 6.1 General

**6.1.1** An additional class notation expresses the classification of additional equipment or specific arrangement, which has been requested by the Interested Party.

**6.1.2** The assignment of such an additional class notation is subject to the compliance with additional rule requirements, which are detailed in Part F of the Rules.

**6.1.3** Some additional class notations are assigned a construction mark, according to the principles given in [3.1.2]. This is indicated in the definition of the relevant additional class notations.

**6.1.4** The different additional class notations which may be assigned to a ship are listed in [6.2] to [6.26], according to the category to which they belong. These additional class notations are also listed in alphabetical order in Tab 5.

**Table 5 : List of additional class notations**

Additional class notation	Definition in	Reference in NR467 or to other Rule Notes	Remarks
<b>ACCESS</b>	[6.25.2]	Pt F, Ch 15, Sec 4	
<b>ALM</b> (1) <b>(ALM)</b> (1) <b>ALM-EN</b> (1) <b>ALM-SUBSEA</b> (1) <b>ALP</b> (1) <b>(ALP)</b> (1)	[6.12]	NR526	<b>ALP, ALM, ALM-EN</b> and <b>ALM-SUBSEA</b> may be completed by <b>-MR</b>
<b>AMMONIAFUEL-PREPARED</b>	[6.25.10]	NR671	<b>AMMONIAFUEL-PREPARED</b> may be completed between brackets by 1 to 6 of the following notations: <b>S, A, T, H, P, B</b>
<b>ASync-COM</b>	[6.5.6]	Pt F, Ch 4, Sec 3	<b>ASync-COM</b> may be completed by <b>-R</b>
<b>AUT-CCS</b> (1)	[6.4.3]	Pt F, Ch 3, Sec 2	
<b>AUT-IMS</b> (1)	[6.4.5]	Pt F, Ch 3, Sec 4	<b>AUT-IMS</b> may be completed by <b>-HWIL</b>
<b>AUT-PORT</b> (1)	[6.4.4]	Pt F, Ch 3, Sec 3	
<b>AUT-UMS</b> (1)	[6.4.2]	Pt F, Ch 3, Sec 1	
<b>AVM-APS</b> (1)	[6.3.2]	Pt F, Ch 2, Sec 1	
<b>AVM-DPS</b> (1)	[6.3.3]	Pt F, Ch 2, Sec 2	<b>AVM-DPS</b> may be completed by the additional suffix <b>/P</b> and/or <b>/NS</b>
<b>AVM-IPS</b> (1)	[6.3.4]	Pt F, Ch 2, Sec 3	<b>AVM-DPS</b> and <b>AVM-IPS</b> may be completed by the additional suffix <b>/NS</b>
<b>AVM-FIRE</b> (1)	[6.3.5]	Pt F, Ch 2, Sec 4	<b>AVM-FIRE</b> is assigned alone or in addition to <b>AVM-APS</b> or <b>AVM-DPS</b>
<b>AWT-A</b> <b>AWT-B</b> <b>AWT-A/B</b>	[6.8.3]	Part F, Chapter 9	
<b>BATTERY SYSTEM</b>	[6.20.1]	Pt F, Ch 14, Sec 1	
<b>BIOFUEL READY</b>	[6.8.20]	Pt F, Ch 9, Sec 13	
<b>BIORISK MANAGED</b> <b>BIORISK SECURED</b>	[6.14.2]	Pt F, Ch 10, Sec 6	
<b>BLUS</b> <b>SLUS</b>	[6.16.3]	Pt F, Ch 12, Sec 2	
<b>BWE</b>	[6.8.4]	Part F, Chapter 9	
<b>BWT</b>	[6.8.5]	Part F, Chapter 9	
<b>CARGOCONTROL</b>	[6.16.5]	Pt F, Ch 12, Sec 4	
<b>CBRN</b> <b>CBRN-WASHDOWN</b>	[6.14.1]	Part F, Chapter 10	
<b>CII-REALTIME</b>	[6.6.5]	Pt F, Ch 5, Sec 3	
<b>CLEANSHIP</b>	[6.8.1]	Part F, Chapter 9	<b>CLEANSHIP</b> may be completed by <b>CEMS</b> .

Additional class notation	Definition in	Reference in NR467 or to other Rule Notes	Remarks
CLEANSHIP SUPER ( )	[6.8.2]	Part F, Chapter 9	between brackets, at least 3 eligible notations are to be assigned among the following ones: <b>AWT-A, AWT-B, AWT-A/B, BWT, GWT, GWT-B, HVSC, NDO -x days, NOX-x%, OWS-x ppm, SOX-x%</b> . <b>CLEANSHIP SUPER ( )</b> may be completed by <b>CEMS</b> .
COLD CARGO	[6.10.5]	Pt F, Ch 8, Sec 4	
COLD DI COLD (H t <sub>DH</sub> , E t <sub>DE</sub> )	[6.10.4]	Pt F, Ch 8, Sec 4	
COMF+	[6.7.4]	Part F, Chapter 6	<b>COMF+</b> is to be complemented by the selected performance indexes (Sound insulation index/ Impact index/ Emergence/ Intermittent noise/ Intelligibility) grade <b>y</b> is equal to <b>1, 2, or 3</b> grade <b>y'</b> is equal to <b>1, 2, 3, 1PK, 2PK or 3PK</b> <b>COMF</b> notations may be completed by <b>-SIS</b> .
COMF-NOISE y	[6.7.2]		
COMF-VIB y'	[6.7.3]		
COMF-NOISE-Crew y	[6.7.5]		
COMF-NOISE-Pax y COMF-VIB-Crew y' COMF-VIB-Pax y'			
COVENT	[6.19.3]	Pt F, Ch 13, Sec 3	
CPS(COT)	[6.24.1]	NR530	cargo oil tanks of crude oil tankers of 5 000 tonnes deadweight (DWT) and above
CPS(MFT)	[6.24.2]	NR530	
CPS(VSP)	[6.24.3]	NR530	
CPS(WBT)	[6.24.4]	NR530	on a voluntary basis for ships other than bulk carriers <b>CSR</b> or oil tankers <b>CSR</b> contracted for construction on or after 8 December 2006
CYBER MANAGED CYBER RESILIENT (1) CYBER SECURE (1)	[6.21.1]	NR659	
DATA-INFRA	[6.5.7]	Pt F, Ch 4, Sec 4	<b>DATA-INFRA</b> may be completed by <b>-STAND</b>
DYNAPOS SAM (1) DYNAPOS AM (1) DYNAPOS AT (1) DYNAPOS AM/AT (1)	[6.15.5]	Pt F, Ch 11, Sec 5	<b>DYNAPOS AM</b> and <b>DYNAPOS AT</b> may be completed by <b>R</b> or <b>RS</b> <b>DYNAPOS AM/AT</b> may be completed by <b>R</b> or <b>RS</b> or <b>(xx ; xx)</b> (corresponding to the two-number vector for the Environmental Station Keeping Index ESKI) <b>DYNAPOS</b> notations may be completed by <b>-HWIL</b> <b>DYNAPOS AM/AT-R</b> or <b>DYNAPOS AM/AT-RS</b> may be completed by <b>-EI</b> <b>DYNAPOS</b> notations may be completed by <b>-DDPS</b>
ECFP-1 ECFP-2 ECFP-3	[6.19.2]	Pt F, Ch 13, Sec 2	<b>ECFP-2</b> and <b>ECFP-3</b> are to be complemented by the notation <b>(Area 1, X<sub>1,m</sub> ; ... ; Area n, X<sub>n,m</sub>)</b>
EFP-A EFP-M EFP-C EFP-AMC	[6.19.1]	Pt F, Ch 13, Sec 1	
EGCS-SCRUBBER	[6.8.12]	Part F, Chapter 9	
ELECTRIC HYBRID ( )	[6.20.2]	Pt F, Ch 14, Sec 2	between brackets, at least 1 eligible notation is to be assigned among the following ones: <b>PM, PB, ZE</b>
ELECTRIC HYBRID PREPARED ( )	[6.20.3]	Pt F, Ch 14, Sec 3	between brackets, at least 1 eligible notation is to be assigned among the following ones: <b>PM, PB, ZE</b>
ERS-H ERS-M ERS-S [ERS-H] [ERS-M] [ERS-S]	[6.13.2]	NR556	
ESA	[6.25.8]	NR592	

Additional class notation	Definition in	Reference in NR467 or to other Rule Notes	Remarks
ETA	[6.26.3]	Pt B, Ch 12, Sec 4, [3]	
EVOC	[6.16.12]	Pt F, Ch 12, Sec 9	
EWCT	[6.16.10]	Pt F, Ch 12, Sec 7	
FORS	[6.8.19]	Pt F, Ch 9, Sec 12	<b>FORS</b> may be complemented by the notation <b>-NS</b>
FSRU READY FSRU READY ( )	[6.25.13]	Pt F, Ch 15, Sec 7	<b>FSRU READY</b> may be complemented, between brackets, by one, more or all of the following notations: <b>P, R, I</b>
GRAB [X]	[6.18.2]	NR606 (2) NR522, Ch 12	on a voluntary basis for bulk carriers other than <b>CSR BC-A</b> or <b>CSR BC-B</b>
GRABLOADING	[6.18.2] b)	Pt F, Ch 15, Sec 2	
GREEN PASSPORT GREEN PASSPORT EU	[6.8.22]	NR528	
GWT GWT-B	[6.8.6]	Part F, Chapter 9	
HABITABILITY	[6.7.6]	Pt F, Ch 6, Sec 6	
HEADING CONTROL-DS HEADING CONTROL-IS	[6.15.2]	Pt F, Ch 11, Sec 2	
HEL	[6.25.3]	Pt F, Ch 15, Sec 5	
HEL(Y)	[6.25.4]	NR500	
HVSC	[6.20.5]	NR557	
HVSC-PREPARED	[6.20.6]	Pt F, Ch 14, Sec 5	<b>HVSC</b> may be completed by the notation <b>-C</b>
HYBRID MECHANICAL PROPULSION	[6.20.4]	Pt F, Ch 14, Sec 4	
HYDROGENFUEL-PREPARED	[6.25.12]	NR678	<b>HYDROGENFUEL-PREPARED</b> may be completed between brackets by a combination of the following notations: <b>S, A, TL</b> or <b>TG, HL</b> or <b>HG, PL</b> or <b>PG, B</b>
IATP ( )	[6.16.11]	Pt F, Ch 12, Sec 8	<b>IATP</b> is to be complemented, between brackets, by one of the following notations: <b>dual setting, boil-off</b> or <b>dual setting and boil-off</b> .
ICE	[6.10.3]	Part F, Chapter 8	
ICE CLASS IA SUPER ICE CLASS IA ICE CLASS IB ICE CLASS IC	[6.10.1]		
ICE CLASS ID	[6.10.2]		
IG	[6.26.2]	Pt D, Ch 7, Sec 6 and Pt D, Ch 8, Sec 9	
INTERNAL CONNECTIVITY	[6.25.15]	NR688	
INWATERSURVEY	[6.25.1]	Pt F, Ch 15, Sec 3	
LASHING LASHING-RSSA( )	[6.16.6]	Pt F, Ch 12, Sec 5	<b>LASHING</b> and <b>LASHING-RSSA( )</b> may be completed by the notation <b>-WAF</b>
LI-HG LI-S1 LI-S2 LI-S3 LI-S4 LI-HG-S1 LI-HG-S2 LI-HG-S3 LI-HG-S4 LI-LASHING	[6.16.1]	Pt B, Ch 1, Sec 5	
LNGFUEL-PREPARED	[6.25.9]	NR529	<b>LNGFUEL-PREPARED</b> may be complemented, between brackets, by one, more or all of the following notations: <b>S, A, P, ME-DF, AE, B</b>
MANOVR	[6.15.1]	Pt F, Ch 11, Sec 1	IMO Resolution MSC 137(76)

Additional class notation	Definition in	Reference in NR467 or to other Rule Notes	Remarks
MEM	[6.8.16]	Pt F, Ch 9, Sec 9	<b>MEM</b> may be completed by <b>-AUX</b> or <b>-PROP</b>
METHANOLFUEL-PREPARED	[6.25.11]	NR670	<b>METHANOLFUEL-PREPARED</b> may be completed, between brackets, by one, more or all of the following notations: <b>S, T, H, P, A, ME-DF, AE, B</b>
MOB	[6.25.14]	Pt F, Ch 15, Sec 6	
MON-HULL	[6.6.2]	Pt F, Ch 5, Sec 1	
MON-ICE	[6.6.4]	NR616	<b>MON-ICE</b> is to be complemented by criteria <b>L(i)</b> , where <b>i</b> is a (list of) Roman numeral(s) from <b>I</b> to <b>VII</b> , or/and <b>G</b>
MON-SHAFT	[6.6.3]	Pt F, Ch 5, Sec 2	
NDO-x days	[6.8.7]	Part F, Chapter 9	
NOX-x%	[6.8.9]	Part F, Chapter 9	
OAS (1)	[6.25.7]	NI629	
OCC-PREPARED	[6.8.14]	Part F, Chapter 9	
OHS (1)	[6.25.6]	NR595	
OPEN-HATCH	[6.16.9]	Pt F, Ch 12, Sec 6	
OWS-x ppm	[6.8.8]	Part F, Chapter 9	
PaRoll1 PaRoll2	[6.16.8]	NR667	may be assigned to container ships
POLAR CLASS z	[6.11]	NR527	<b>z</b> is equal to <b>1, 2, 3, 4, 5, 6</b> or <b>7</b>
PROTECTED FO TANK	[6.8.18]	Pt F, Ch 9, Sec 11	
REF-CARGO (1)	[6.9.2]	Pt F, Ch 7, Sec 2	<b>REF-CARGO</b> may be complemented by the notations: <b>-AIRCONT, -PRECOOLING</b> and/or <b>-QUICKFREEZE</b>
REF-CONT (1)	[6.9.3]	Pt F, Ch 7, Sec 3	
REF-STORE (1)	[6.9.4]	Pt F, Ch 7, Sec 4	<b>REF-STORE</b> may be complemented by the notations: <b>-PRECOOLING</b> and/or <b>-QUICKFREEZE</b>
SAFE-LASHING	[6.16.7]	–	
SAS	[6.16.4]	Pt F, Ch 12, Sec 3	
SDS	[6.17.1]	Pt B, Ch 3, Sec 3	
SCRUBBER READY	[6.8.13]	Pt F, Ch 9, Sec 7	
SINGLEPASSLOADING	[6.16.2]	Pt F, Ch 12, Sec 1	<b>SINGLEPASSLOADING</b> may be complemented by the design loading rate in tons per hour, for example: <b>SINGLEPASSLOADING [xxxxx t/h]</b>
SMART( )	[6.23.1]	NR675	<b>SMART( )</b> is to be completed between brackets by at least one of the following notations: <b>Hx, Mx, MHx, Nx, EnEx, Lx</b> and <b>Xx</b> where <b>x</b> indicates the smart group designation ( <b>1, 2</b> or <b>3</b> ). The notation <b>EnEx</b> may be complemented by one or by a combination of the following complementary notations: <b>-Em, -T, -LIT, -S, -W</b> and <b>-CII</b> .
SOX-x%	[6.8.10]	Part F, Chapter 9	as an alternative, equivalent arrangements (e.g. exhaust gas cleaning systems) may be accepted
Spectral Fatigue ( )	[6.18.3]	NI 611	the information between brackets is a short description of routes and/or areas considered for the spectral fatigue analysis and associated design fatigue life
SPM	[6.15.3]	Pt F, Ch 11, Sec 3	
STABLIFT	[6.17.2]	Pt E, Ch 8, Sec 3	
STAB-WIND	[6.17.3]	NR500	
STAR-CARGO (1)	[6.2.7]	Pt F, Ch 1, Sec 4	
STAR-REGAS (1)	[6.2.6]	Pt F, Ch 1, Sec 3	
STAR-MACH (1)	[6.2.4]	Pt F, Ch 1, Sec 2	
STAR-MACH SIS (1)	[6.2.5]	Pt F, Ch 1, Sec 2	

Additional class notation	Definition in	Reference in NR467 or to other Rule Notes	Remarks
<b>STRENGTHBOTTOM</b>	[6.18.1]	Pt F, Ch 15, Sec 1	
<b>SUSTAINABLESHIP-1</b> <b>SUSTAINABLESHIP-2</b>	[6.22.1]	Pt F, Ch 15, Sec 8	
<b>SYNC-COM</b>	[6.5.6]	Pt F, Ch 4, Sec 3	<b>SYNC-COM</b> may be completed by <b>-R</b>
<b>SYS-IBS</b> (1) <b>SYS-IBS-1</b> (1)	[6.5.3]	Pt F, Ch 4, Sec 2	<b>SYS-IBS</b> can only be assigned to ships which are also assigned the notation <b>SYS-NEQ</b> <b>SYS-IBS-1</b> can only be assigned to ships which are also assigned the notations <b>SYS-NEQ-1</b> and <b>AUT-UMS</b> <b>SYS-IBS</b> and <b>SYS-IBS-1</b> may be complemented by <b>-HWIL</b>
<b>SYS-NEQ</b> (1) <b>SYS-NEQ-1</b> (1)	[6.5.2]	Pt F, Ch 4, Sec 1	
<b>SYS-NEQ-OSV</b> (1)	[6.5.5]	NR633	
<b>ULEV</b>	[6.8.15]	Pt F, Ch 9, Sec 8	
<b>UNSHeltered ANCHORING</b>	[6.15.4]	Pt F, Ch 11, Sec 4	
<b>URN</b>	[6.8.21]	NR 614	
<b>VCS</b>	[6.8.17]	Pt F, Ch 9, Sec 10	<b>VCS</b> may be complemented by the specific notation: <b>-TRANSFER</b> (see [6.8.17])
<b>VeriSTAR-HULL</b> (1) <b>VeriSTAR-HULL CM</b> (1)	[6.2.2]	Pt F, Ch 1, Sec 1	these notations may be completed by the notation <b>FLM</b> these notations may be complemented by <b>FAT</b> or <b>FAT xx years</b> , with $25 \leq xx \leq 40$ (3)
<b>WhiSp1</b> <b>WhiSp2</b> <b>WhiSp3</b>	[6.18.4]	NR583	
<b>WIND PROPULSION</b> (1)	[6.25.5]	NR206	<b>WIND PROPULSION</b> may be completed by <b>-1</b> or <b>-2</b>
<b>YOUNG ICE 1</b> <b>YOUNG ICE 2</b>	[6.10.2]	Part F, Chapter 8	
(1) A construction mark is added to this notation. (2) Bulk carriers and Oil Tankers assigned with the additional service feature <b>CSR</b> contracted for new construction on or after 1 July 2015 are to comply with the requirements of NR606 Common Structural Rules for Bulk Carriers and Oil Tankers. (3) For vessels contracted before 1st July 2016 the notation <b>DFL xx years</b> may have been assigned in lieu of <b>FAT xx years</b> .			

## 6.2 VeriSTAR and STAR notations

### 6.2.1 General

**VeriSTAR** and **STAR** notations integrate rational analysis at design stage or after construction and possibly with data and records from ships-in-service concerning planned inspection and ship maintenance.

In compliance with [6.1.3], these notations are assigned a construction mark, as defined in Article [3].

The requirements for the assignment of these notations are given in Part F, Chapter 1, as detailed in [6.2.2] to [6.2.7], except for **VeriSTAR-HULL SIS**, **STAR-HULL** and **STAR SIS** as detailed in [6.2.3].

### 6.2.2 VeriSTAR-HULL CM and VeriSTAR-HULL

The additional class notation **VeriSTAR-HULL CM** may be assigned to new ships, contracted for construction on or after the 1st July 2015, the structural condition of which is checked with 3D FEM calculation program at design stage, according to the requirements of the Society for which the hull surveys for new construction are carried out according to the requirements of Ch 3, Sec 7 and for which the requirements of Pt F, Ch 1, Sec 1 are fulfilled.

Existing ships contracted for construction before the 1st July 2015 and for which the structural condition is checked with 3D FEM calculation program at design stage according to the requirements of the Society may be assigned with the notation **VeriSTAR-HULL**.

**VeriSTAR-HULL CM** and **VeriSTAR-HULL** encompass the fatigue assessment carried out on selected structural details as per the requirements of Part B.

The additional class notations **VeriSTAR-HULL CM** and **VeriSTAR-HULL** may be assigned to ships of less than 150 m in length, subject to special consideration by the Society.

The additional class notations **VeriSTAR-HULL CM** and **VeriSTAR-HULL** may be completed by the notation **FLM** when a complementary tridimensional structural analysis has been performed based on a full length finite elements model.

The requirements for the assignment of these notations are given in Pt F, Ch 1, Sec 1.

The additional class notations **VeriSTAR-HULL CM** and **VeriSTAR-HULL** may be completed by the notation **FAT** when a fatigue assessment has been carried on selected structural details in accordance with Pt B, Ch 10, Sec 1 and Part D or Part E when relevant.

The notation **FAT** may be completed by **xx years**, with xx having values between 25 and 40, when evaluated design fatigue life is not less than xx years.

Note 1: For vessels contracted before 1st July 2016 the notation **DFL xx years** may have been assigned in lieu of **FAT xx years**.

### 6.2.3 VeriSTAR-HULL SIS, STAR-HULL and STAR SIS

These additional class notations **VeriSTAR-HULL SIS**, **STAR-HULL** and **STAR SIS** may have been assigned to ships contracted for construction before 1st July 2022 and are not applicable to ships contracted for construction on or after 1st July 2022. They were not applicable to ships assigned the additional service feature **CSR**.

The requirements for maintenance of these notations are given in Ch 5, Sec 2.

Note 1: The requirements for the assignment of these notations were given in the edition July 2021 (as amended in January 2022) of NR467 Rules for the Classification of Steel Ships, in respectively, Pt A, Ch 1, Sec 2, [6.2.3]; Pt A, Ch 1, Sec 2, [6.2.4] and Pt A, Ch 1, Sec 2 [6.2.7].

### 6.2.4 STAR-MACH

The additional class notation **STAR-MACH** may be assigned, after construction, to ships for which a risk analysis has been performed for ship propulsion, steering installations and associated auxiliary systems (machinery, electrical) in order to support and validate the Maintenance Plan in the operating context.

The requirements for the assignment of this notation are given in Pt F, Ch 1, Sec 2.

### 6.2.5 STAR-MACH SIS

The additional class notation **STAR-MACH SIS** is assigned to ships on which a Planned Maintenance Survey system for machinery (PMS) is implemented as per the requirements of Ch 2, Sec 2, [4.4] for which the Maintenance Plan of the ship propulsion, steering installations and associated auxiliary systems (machinery, electrical) is re-approved periodically based on a risk analysis update.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 1, Sec 2 and in Ch 5, Sec 2.

### 6.2.6 STAR-REGAS

The additional class notation **STAR-REGAS** may be assigned, after construction, to ships having both the service notation **liquefied gas carrier** and the additional service feature **REGAS** (with or without the additional service feature **STL-SPM**) and for which a risk analysis has been performed for the regasification installation and its associated systems, in order to support and validate the maintenance plan in the operating context.

The requirements for the assignment of this notation are given in Pt F, Ch 1, Sec 3.

### 6.2.7 STAR-CARGO

The additional class notation **STAR-CARGO** may be assigned, after construction, to ships liable to carry cargoes and for which a risk analysis has been performed for the cargo handling installation and its associated systems, in order to support and validate the maintenance plan in the operating context.

The requirements for the assignment of this notation are given in Pt F, Ch 1, Sec 4.

## 6.3 Availability of machinery (AVM)

### 6.3.1 General

The notations dealt with under this heading are relevant to systems and/or arrangements enabling the ship to carry on limited operations when single failure affects propulsion or auxiliary machinery or when an external event such as fire or flooding involving machinery spaces affects the availability of the machinery.

In compliance with [6.1.3], these notations are assigned a construction mark, as defined in Article [3].

The requirements for the assignment and maintenance of these notations are given respectively in Part F, Chapter 2 and in Ch 5, Sec 3.

### 6.3.2 Alternative propulsion system (AVM-APS)

The additional class notation **AVM-APS** is assigned to ships which are fitted with systems and/or arrangements enabling them to maintain operating conditions with some limitations in speed, range and comfort, in the case of single failure of items relative to the propulsion or power generating system.

The limitations in operation and the types of single failure covered by this notation are specified in Pt F, Ch 2, Sec 1, [1.2].

### 6.3.3 Duplicated propulsion system (AVM-DPS)

The additional class notation **AVM-DPS** is assigned to ships which are fitted with a duplicated propulsion system enabling them to maintain operating conditions with some limitations in power (but 50% of the main power is to be maintained), speed, range and comfort, in the case of single failure of items relative to the propulsion or power generating system.

The limitations in operation and the types of failure which are covered by this notation are specified in Pt F, Ch 2, Sec 2, [1.2].

The additional suffix **P** may be added to the notation when all components as defined in Pt F, Ch 2, Sec 2, [1.2.6], item b), are included in the definition of system failure.

The additional suffix **NS** may be added to the notation when the ship is intended for normal operation with one propulsion system out of service in accordance with the provisions of Pt F, Ch 2, Sec 2, [4].

Example:

**AVM-DPS/NS**

**AVM-DPS/P/NS**

Note 1: The loss of one compartment due to fire or flooding is not considered as a single failure case.

### 6.3.4 Independent propulsion system (AVM-IPS)

The additional class notation **AVM-IPS** is assigned to ships which are fitted with an independent propulsion system enabling them to maintain operating conditions with some limitations in power (but 50% of the main power is to be maintained), speed, range and comfort, in the case of single failure of items relative to the propulsion or power generating system.

The limitations in operation and the types of failure which are covered by this notation are specified in Pt F, Ch 2, Sec 3, [1.2].

The additional suffix **NS** may be added to the notation when the ship is intended for normal operation with one propulsion system out of service in accordance with the provisions of Pt F, Ch 2, Sec 3, [4].

Note 1: The loss of one compartment due to fire or flooding is considered as a single failure case.

### 6.3.5 Fire mitigation for main diesel-generator rooms (AVM-FIRE)

The additional class notation **AVM-FIRE** is assigned to ships which are fitted with an electrical production plant distributed over minimum two main diesel-generator rooms enabling to maintain sufficient operating functionality with respect to propulsion, safety, navigation and steering, and a minimum of 50% operability for defined habitability services in case of loss of one main diesel-generator room due to fire.

The additional class notation **AVM-FIRE** is assigned alone or in addition to the additional class notation **AVM-APS** or **AVM-DPS**.

## 6.4 Automated machinery systems (AUT)

### 6.4.1 General

The notations dealt with under this heading are relevant to automated machinery systems installed on board ships.

In compliance with [6.1.3], these notations are assigned a construction mark, as defined in Article [3].

The requirements for the assignment and maintenance of these notations are given respectively in Part F, Chapter 3 and in Ch 5, Sec 4.

### 6.4.2 Unattended machinery space (AUT-UMS)

The additional class notation **AUT-UMS** is assigned to ships which are fitted with automated installations enabling machinery spaces to remain periodically unattended in all sailing conditions including manoeuvring.

### 6.4.3 Centralised control station (AUT-CCS)

The additional class notation **AUT-CCS** is assigned to ships which are fitted with machinery installations operated and monitored from a centralised control station.

### 6.4.4 Automated operation in port (AUT-PORT)

The additional class notation **AUT-PORT** is assigned to ships which are fitted with automated installations enabling the ship's operation in port or at anchor without personnel specially assigned for the watch-keeping of the machinery in service.

### 6.4.5 Integrated machinery system (AUT-IMS)

The additional class notation **AUT-IMS** is assigned to ships which are fitted with automated installations enabling machinery spaces to remain periodically unattended in all sailing conditions including manoeuvring, and additionally provided with integrated systems enabling to handle control, safety and monitoring of machinery.

The notation **-HWIL** is added to the additional class notation **AUT-IMS** when the control system has been verified according to the requirements of NR632, Hardware-in-the-loop Testing.

## 6.5 Integrated and digital systems

### 6.5.1 General

The notations dealt with under this heading are relevant to operation of integrated systems regarding navigation, machinery, communication and specific cargo, as applicable.

In compliance with [6.1.3], these notations are assigned a construction mark, as defined in Article [3].

The requirements for the assignment and maintenance of these additional class notations are given, as applicable, in:

- NR633 for the notation **SYS-NEQ-OSV**
- Part F, Chapter 4 and Ch 5, Sec 5, respectively, for the other notations **SYS**.

### 6.5.2 Centralised navigation equipment (SYS-NEQ and SYS-NEQ-1)

The additional class notation **SYS-NEQ** is assigned to ships which are fitted with a centralised navigation control system so laid out and arranged that it enables normal navigation and manoeuvring operation of the ship by two persons in cooperation.

The additional class notation **SYS-NEQ-1** is assigned when, in addition to the above, the installation is so arranged that the navigation and manoeuvring of the ship can be operated under normal conditions by one person, for periodical one man watch. This notation includes specific requirements for prevention of accidents caused by the operator's unfitness.

### 6.5.3 Integrated bridge system (SYS-IBS and SYS-IBS-1)

The additional class notation **SYS-IBS** is assigned to ships fitted with an integrated bridge system which allows simplified and centralised bridge operation of the main functions of navigation, manoeuvring and communication, as well as monitoring from bridge of other functions related to passage execution, route control and monitoring and control and monitoring of machinery installation according to Part C, Chapter 3.

The notation **SYS-IBS** is assigned only to ships which are also assigned the additional class notation **SYS-NEQ**.

The additional class notation **SYS-IBS-1** is assigned to ships fitted with an integrated bridge system which allows simplified and centralised bridge operation of the main functions of navigation, manoeuvring and communication, as well as monitoring from bridge of other functions related to passage execution, route control and monitoring and control and monitoring of machinery installation according to Part C, Chapter 3 and Pt F, Ch 3, Sec 1 (**AUT-UMS** notation).

In addition, the following functions may be part of the notation **SYS-IBS-1**:

- external/internal communication system
- monitoring of specific cargo operations
- pollution monitoring
- monitoring of heating, ventilation and air conditioning for passenger ships.

The notation **SYS-IBS-1** is assigned only to ships which are also assigned the additional class notation **SYS-NEQ-1**.

The notation **-HWIL** is added to the additional class notations **SYS-IBS** and **SYS-IBS-1** when the control system has been verified according to the requirements of NR632, Hardware-in-the-loop Testing.

### 6.5.4 Safety and security of communication system (SYS-COM)

The additional class notation **SYS-COM** may have been assigned to ships contracted for construction before 1<sup>st</sup> January 2023 and is not applicable to ships contracted for construction on or after 1<sup>st</sup> January 2023.

The requirements for maintenance of this additional class notation are given in Ch 5, Sec 5.

### 6.5.5 Bridge design and instrumentation (SYS-NEQ-OSV)

The additional class notation **SYS-NEQ-OSV** may be assigned to ships fulfilling specific requirements for bridge design and instrumentation, and, in addition, provided with further means for safe operation in all the waters, including areas with harsh operational and environmental conditions such as the North Sea.

The aim of the additional class notation **SYS-NEQ-OSV** is to reduce the risk, in bridge operation, of failure causing collision, contact and grounding.

The requirements for the assignment of this notation are given in Rule Note NR633.

### 6.5.6 Ship-Shore Communication

The additional class notation **ASYNC-COM** may be assigned to ships equipped with asynchronous communication systems which can ensure transfer of data between the ship and the shore.

When the communication systems are redundant, the additional class notation **ASYNC-COM** is complemented by the suffix **-R**.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 4, Sec 3 and Ch 5, Sec 5.

The additional class notation **SYNC-COM** may be assigned to ships equipped with synchronous communication systems which can ensure transfer of data between the ship and the shore.

When the communication systems are redundant, the additional class notation **SYNC-COM** is complemented by the suffix **-R**.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 4, Sec 3 and Ch 5, Sec 5.

### 6.5.7 DATA-INFRA

The additional class notation **DATA-INFRA** may be assigned to ships fitted with a data infrastructure on board, which ensure reliable data collection, transmission, storage, control, sharing and availability to multiple data consumers.

The additional class notation **DATA-INFRA** may be completed by the suffix **-STAND**, when the data infrastructure supports international standards or norms which are ensuring a higher level of interoperability with other systems.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 4, Sec 4 and Ch 5, Sec 5.

## 6.6 Monitoring equipment

### 6.6.1 General

The notations dealt with under this heading are relevant to hull and tailshaft monitoring equipment installed on board ships.

### **6.6.2 Hull stress monitoring (MON-HULL)**

The additional class notation **MON-HULL** is assigned to ships which are fitted with equipment continuously monitoring ship's dynamic loads through measurements of motions in waves and stresses/deformations in the hull structure.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 5, Sec 1 and in Ch 5, Sec 6.

### **6.6.3 Tailshaft monitoring system (MON-SHAFT)**

The additional class notation **MON-SHAFT** is assigned to ships fitted with oil or water lubricated systems for tailshaft bearings. The assignment of this notation allows the ship to be granted a reduced scope for complete tailshaft surveys, see Ch 2, Sec 2, [5.5.3] and Ch 5, Sec 6, [3].

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 5, Sec 2 and in Ch 5, Sec 6.

### **6.6.4 Ice load monitoring system (MON-ICE)**

The additional class notation **MON-ICE** is assigned to ships which are fitted with equipment to continuously monitor ice loads exerted on ship's hull by ice formations.

The notation **MON-ICE** is to be completed by one of the criteria **L(i)** and **G**, as follows:

- **MON-ICE L(i)** for ships equipped with a local ice load monitoring system, where **i** is a (list of) Roman numeral(s) from **I** to **VII**, depending on the design scenario
- **MON-ICE G** for ships intended to perform ramming and required to be equipped with a hull girder ice load monitoring system.

Note 1: The above letters and numerals denote the location (i.e. areas and regions) of the sensors and the interaction scenario, and the two notations are cumulative.

Examples: **MON-ICE L(I, III, VI), MON-ICE G**  
**MON-ICE L(II), MON-ICE G**

The requirements for the assignment and maintenance of these notations are given respectively in NR616 Ice Load Monitoring System (MON-ICE) and in Ch 5, Sec 6.

### **6.6.5 Real-Time Carbon Intensity Indicator (CII-REALTIME)**

The additional class notation **CII-REALTIME** may be assigned to ships provided with computer based systems which:

- collect the data for the IMO Data Collection System (DCS) in order to calculate a Continuous Carbon Index (Continuous CII, as defined in Pt F, Ch 5, Sec 3, [1.2.1])
- allow access to the data by the users on board and on shore through a dedicated digital interface.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 5, Sec 3 and Ch 5, Sec 6.

## **6.7 Comfort on board ships and habitability**

### **6.7.1 Notations COMF**

The notations listed in [6.7.2] to [6.7.5] are relevant to the assessment of comfort on board ships with regard to the noise and/or vibration.

The parameters which are taken into consideration for the evaluation of the comfort, such as the level of noise, the level of vibration, may be indicated in a memorandum.

**COMF** notations, as defined in [6.7.2] to [6.7.5], are to be considered as design notations.

The requirements for the assignment of these notations are given in Part F, Chapter 6.

It is the responsibility of the Owner to advise the Society of modifications, alterations or repairs, including major machinery item replacements, which may lead to a significant modification of the noise and vibration levels on board compared to initial survey. In such a case, a renewal survey may be carried out following a measurement programme agreed between the Owner and the Society.

For ships intended with in-service assessment, the notations **COMF** as defined in [6.7.2] to [6.7.5] are followed by notation **-SIS**. The requirements for the maintenance of these notations are given in Ch 5, Sec 7.

### **6.7.2 Comfort with regard to noise (COMF-NOISE)**

The additional class notation **COMF-NOISE** is assigned to ships satisfying levels of noise defined in Part F, Chapter 6. The assessment of noise levels is carried out through measurements during harbour and sea trials.

The notation is completed by a grade **1**, **2** or **3** which represents the comfort level achieved for the assignment of the notation. The lower grade (**1**) corresponds to the higher class of comfort.

Example:

**COMF-NOISE 2**

### **6.7.3 Comfort with regard to vibration (COMF-VIB)**

The additional class notation **COMF-VIB** is assigned to ships satisfying levels of vibration defined in Part F, Chapter 6. The assessment of vibration is carried out through measurements during harbour and sea trials.

The notation is completed by a grade:

- **1, 2** or **3** for an evaluation based on overall frequency criteria, or
- **1PK, 2PK** or **3PK** for an evaluation based on single amplitude peak criteria.

The grade represents the comfort level achieved for the assignment of the notation. The lower grade (**1** or **1PK**) corresponds to the higher class of comfort.

Example:

**COMF-VIB 1PK**

### **6.7.4 High comfort level with regard to noise (COMF+)**

The additional class notation **COMF+** is assigned only to ships having the service notation **yacht** or **charter yacht** satisfying levels of noise defined in Pt F, Ch 6, Sec 5.

Note 1: The additional class notation **COMF+** may also be applied to ships assigned with the service notation **Passenger ship** after special consideration.

The requirements for the assignment of this notation are given in NR500, Rules for the Classification and Certification of Yachts.

### **6.7.5 Comfort for passenger and crew areas**

The additional class notations **COMF-NOISE-Pax**, **COMF-NOISE-Crew**, followed by grade **1, 2** or **3** and **COMF-VIB-Pax** and **COMF-VIB-Crew**, followed by grade **1, 2** or **3** or **1PK, 2PK** or **3PK** are assigned to ships satisfying levels of noise / vibration defined in Part F, Chapter 6, for passenger or crew area, as applicable.

Example:

**COMF-VIB-Crew 3**

### **6.7.6 Habitability**

The additional class notation **HABITABILITY** may be assigned to ships found to be in compliance with the criteria of the Maritime Labour Convention and with the provisions contained in Pt F, Ch 6, Sec 6.

The requirements for the maintenance of this notation are given in Ch 5, Sec 7.

Note 1: Ships assigned, before 1<sup>st</sup> January 2017, with the additional class notation **ACCOMMODATION** may keep this notation until the first renewal survey, time at which the former additional class notation is to be replaced by **HABITABILITY**.

## **6.8 Environmental protection**

### **6.8.1 Pollution prevention (CLEANSHIP)**

The additional class notation **CLEANSHIP** is assigned to ships so designed and equipped as to control and limit the emission of polluting substances in the sea and the air in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 2.

The requirements for the maintenance of this notation are given in Ch 5, Sec 8.

Note 1: The additional class notations **CLEANSHIP** may be completed by the notation **CEMS**, as defined in [6.8.11].

### **6.8.2 Pollution prevention (CLEANSHIP SUPER)**

The additional class notation **CLEANSHIP SUPER** is assigned to ships so designed and equipped as to control and limit the emission of polluting substances in the sea and the air in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 2.

Note 1: At least 3 eligible notations are to be assigned among the following ones:

**AWT-A, AWT-B, AWT-A/B, BWT, GWT, GWT-B, HVSC, NDO-x days, NOX-x%, OWS-x ppm, SOX-x%**

Example:

**CLEANSHIP SUPER (AWT, NOX-80%, SOX-60%)**

The requirements for the maintenance of this notation are given in Ch 5, Sec 8.

Note 2: The additional class notations **CLEANSHIP SUPER ( )** may be completed by the notation **CEMS**, as defined in [6.8.11].

### **6.8.3 Advanced wastewater treatment (AWT)**

The following additional class notations are assigned to ships fitted with Advanced Wastewater Treatment plant in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 3 as relevant:

- **AWT-A** for ships complying with Alaska specific requirements
- **AWT-B** for ships complying with the specific requirements of IMO Resolution MEPC.227(64) paragraph 4.2 applicable to ships operating in special areas
- **AWT-A/B** for ships complying with the 2 above mentioned specific requirements.

Note 1: ships complying only with general requirements of IMO Resolution MEPC.227(64) are not granted with any specific notation.

The requirements for the maintenance of this notations are given in Ch 5, Sec 8.

#### **6.8.4 Ballast water exchange (BWE)**

The additional class notation **BWE** is assigned to ships intended for ballast water exchange at sea and whose design is in compliance with the technical provisions of BWM Convention (2004), Regulation D-1 and in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 4.

Note 1: the additional class notation **BWE** does not waive the ship from being in compliance with any statutory or local requirement applicable to her.

The requirements for maintenance of this notation are given in Ch 5, Sec 8.

#### **6.8.5 Ballast water treatment (BWT)**

The additional class notation **BWT** is assigned to ships fitted with a Ballast Water Treatment plant in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 4.

The requirements for the maintenance of this notation are given in Ch 5, Sec 8.

#### **6.8.6 Grey water treatment (GWT)**

The following additional class notations are assigned to ships fitted with a treatment installation for grey waters in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 5:

- **GWT** for ships complying with the requirements of IMO Resolution MEPC.227(64) section 4.1
- **GWT-B** for ships complying with the requirements of IMO Resolution MEPC.227(64) sections 4.1 and 4.2.

The requirements for the maintenance of these notations are given in Ch 5, Sec 8.

#### **6.8.7 No discharge operation (NDO-x days)**

The additional class notation **NDO-x days** is assigned to ships designed for no discharge operation during x days, in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 5.

Note 1: **x days** is the number of consecutive days the ship is able to operate with the full complement of on-board people, including crew and passengers, without the need for discharging any substances into the sea. This number cannot be less than one day (24 hours).

The requirements for the maintenance of this notations are given in Ch 5, Sec 8.

#### **6.8.8 High-performance oily water separator (OWS-x ppm)**

The additional class notation **OWS-x ppm** is assigned to ships fitted with an oily water separator producing effluents having a hydrocarbon content not exceeding x ppm (parts per million) in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 5.

The requirements for the maintenance of this notations are given in Ch 5, Sec 8.

#### **6.8.9 NOx emissions control (NOX-x%)**

The additional class notation **NOX-x%** is assigned to ships for which the average NOx emissions of engines are not to exceed x% of IMO Tier II limit in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 6.

The requirements for the assignment and maintenance of this notations are given respectively in Part F, Chapter 9 and in Ch 5, Sec 8.

#### **6.8.10 SOx emissions control (SOX-x%)**

The additional class notation **SOX-x%** is assigned to ships for which the oil fuels used within and outside SECAs have a sulphur content not exceeding x% of the relevant IMO limit in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 6.

Note 1: As an alternative, equivalent arrangements (e.g. exhaust gas cleaning systems) may be accepted.

The requirements for the maintenance of this notations are given in Ch 5, Sec 8.

#### **6.8.11 Continuous emission monitoring system (CEMS)**

The additional class notations **CLEANSHIP** and **CLEANSHIP SUPER ( )** may be completed by the notation **CEMS** when the ship is fitted with a measurement, monitoring, recording and transmission equipment of air emissions in compliance with the requirements laid down in Pt F, Ch 9, Sec 6.

The requirements for the maintenance of this notation are given in Ch 5, Sec 8.

#### **6.8.12 Exhaust gas cleaning system-SCRUBBER (EGCS-SCRUBBER)**

The additional class notation **EGCS-SCRUBBER** is assigned to ships fitted with an Exhaust Gas Cleaning System using Scrubber(s) installed in accordance with the provisions of Pt F, Ch 9, Sec 1 and Pt F, Ch 9, Sec 7.

The requirements for the maintenance of this notations are given in Ch 5, Sec 8.

#### **6.8.13 SCRUBBER READY**

The additional class notation **SCRUBBER READY** is assigned to ships on which an exhaust gas cleaning system is planned to be installed in the future. This additional class notations may be granted to a new ship or a ship in service during overhaul period. The requirements for the assignment of this notation are given in Pt F, Ch 9, Sec 7

#### **6.8.14 OCC-PREPARED**

The additional class notation **OCC-PREPARED** may be assigned to ships with specific arrangements intended to accommodate an onboard carbon capture and storage system (CCS) at a later stage.

The requirements for the assignment of this notation are given in Pt F, Ch 9, Sec 14.

#### **6.8.15 Ultra-low emission vessel (ULEV)**

The additional class notation **ULEV** may be assigned to sea-going ships. The additional class notation **ULEV** may not be assigned to vessels dedicated to operations on inland waterways (including estuaries, rivers, estuary and lakes) falling into the scope of EU Regulation 2016/1628.

The additional class notation **ULEV** refers to the capacity of the internal combustion engines installed on a ship to emit gaseous pollutants and particular pollutants at a very low level at the time of assignment of the notation.

When granting the additional class notation **ULEV**, a memorandum is to be endorsed in order to record the list of engines covered, the fuel(s) with which they have been tested and their ULEV mode if any.

The requirements for the assignment and the maintenance of this notation are given respectively in Pt F, Ch 9, Sec 8 and in Ch 5, Sec 8.

#### **6.8.16 Methane emission measurement (MEM)**

The additional class notation **MEM** may be assigned to ships having one of the additional service features **LNGfuel** or **CNGfuel**, and fitted with gas-fuelled or dualfuel internal combustion engines for which the level of methane emissions in gas operating mode has been measured.

When granting the additional class notation **MEM**, a memorandum is to be endorsed in order to record:

- the list of engines covered
- for each engine, the measured brake specific emissions of methane, in g/kWh
- for each engine, the average level of methane emissions as a mass percentage, in g of CH<sub>4</sub> / g of gas fuel supplied to the engine.

The additional class notation **MEM** may be completed by:

-**AUX**, when the level of methane emissions has been measured only for auxiliary gas-fuelled or dual fuel engines

-**PROP**, when the level of methane emissions has been measured only for propulsion gas-fuelled or dual fuel engines

-**AUX** and -**PROP** are not appended to **MEM** when the level of methane emissions has been measured for all gas-fuelled or dual fuel engines on board.

The requirements for the assignment of this notation are given in Pt F, Ch 9, Sec 9.

#### **6.8.17 Vapour control system (VCS)**

The additional class notation **VCS** (Vapour Control System) may be assigned to ships equipped with cargo vapour control systems. The notation -**TRANSFER** is added to the notation where, in addition, the ship is fitted with specific arrangements for transferring cargo vapours to another ship.

This notation is assigned only to ships having the service notation **oil tanker, combination carrier/OBO ESP, combination carrier/OOC ESP, liquefied gas carrier, chemical tanker** or **FLS tanker**. For the service notation **liquefied gas carrier**, the additional class notation **VCS** may be assigned only to gas carriers designed for various cargoes, especially those ones which are also covered by IBC code. This notation can not be assigned to a LNG carrier.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 9, Sec 10 and in Ch 5, Sec 8, [5].

#### **6.8.18 Protected FO tank**

The additional class notation **PROTECTED FO TANK** may be assigned to ships with an aggregate oil fuel capacity of less than 600 m<sup>3</sup>, fitted with oil fuel tanks complying with the requirements given in Pt F, Ch 9, Sec 11.

#### **6.8.19 Fast oil recovery system (FORS)**

The additional class notation **FORS** may be assigned to ships with oil fuel tanks and cargo tanks, as applicable, fitted with two (or more) connectors allowing the recovery of the tank contents as follows:

- by injecting sea water through one connector, the tank contents being recovered through the other one, and
- by introducing a submersible pump in the tank through one of the connectors.

The requirements for the assignment of this notation are given in Pt F, Ch 9, Sec 12.

The additional class notation **FORS** may be completed by the notation -**NS** when the connectors are intended to be used during the normal service of the ship and, for that purpose, comply with the additional requirements given in Pt F, Ch 9, Sec 12, [3].

For ships not assigned with the notation -**NS**, the connectors may be used only to facilitate the recovery of the tank contents when the ship is damaged or wrecked.

### **6.8.20 BIOFUEL READY**

The additional class notation **BIOFUEL READY** may be assigned to new and existing ships for which the use of biofuel has been technically analysed and, if applicable, tested.

When granting the additional class notation **BIOFUEL READY**, a memorandum is to be endorsed in order to record:

- the specification of the biofuel(s) intended to be used, the blend ratio(s) and type(s) of blend(s) (including fossil fuel specification)
- the list of engines covered and their main destination (auxiliary or propulsion).

The requirements for the assignment of this notation are given in Pt F, Ch 9, Sec 13.

### **6.8.21 Underwater radiated noise (URN)**

The additional class notation **URN** may be assigned to self-propelled ships meeting the underwater radiated noise level limits complying with the requirements of NR614 Underwater Radiated Noise (URN).

According to the limits given in Rule Note NR614, the notation **URN** is to be completed as follows:

**URN - controlled vessel**

**URN - advanced vessel**

**URN - specified vessel**

The requirements for the assignment and maintenance of this notation are given in Rule Note NR614.

### **6.8.22 Green passport for ship recycling**

The additional class notation **GREEN PASSPORT** or **GREEN PASSPORT EU** may be assigned to ships for which requirements intended to facilitate ship recycling have been applied, encompassing the identification, quantification and localization of materials which may cause harm to the environment and people when the fittings or equipment containing such materials are removed, or when the ship is recycled, as detailed hereafter.

**GREEN PASSPORT** may be assigned to ships for which such requirements have been applied in accordance with:

- the Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships, 2009, and
- the European Regulation Reg (EU) N°1257/2013 on Ship Recycling, as amended, as applicable to ships flying the Flag of a non-EU member State.

**GREEN PASSPORT EU** may be assigned to ships for which such requirements have been applied in accordance with:

- the Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships, 2009, and
- the European Regulation Reg (EU) N°1257/2013 on Ship Recycling as applicable to ships flying the Flag of a EU member State.

The requirements for the assignment and maintenance of this notation are given in NR528 Green Passport.

## **6.9 Refrigerating installations**

### **6.9.1 General**

The notations dealt with under this heading are relevant to refrigerating installations fitted on board ships, including machinery and storing equipment or arrangements.

In compliance with [6.1.3], these notations are assigned a construction mark, as defined in Article [3].

The requirements for the assignment and maintenance of these notations are given respectively in Part F, Chapter 7 and in Ch 5, Sec 9.

### **6.9.2 Refrigerating installations for cargo (REF-CARGO)**

The additional class notation **REF-CARGO** is assigned to ships fitted with refrigerating plants and holds intended to carry cargoes, with the condition that the number and the power of the refrigerating units are such that the specified temperatures can be maintained with one unit on standby.

The notation **-AIRCONT** is added when the refrigerating plant is equipped with controlled atmosphere installations.

### **6.9.3 Self refrigerated containers (REF-CONT)**

The additional class notation **REF-CONT** is assigned to ships intended to supply electrical power to self-refrigerated containers.

### **6.9.4 Refrigerating installations for domestic supplies (REF-STORE)**

The additional class notation **REF-STORE** is assigned to ships fitted with refrigerating plants and spaces exclusively intended for the preservation of ship's domestic supplies.

**6.9.5** The additional class notations **REF-CARGO** and **REF-STORE** may also be completed by the following notations:

- PRECOOLING** when the refrigerating plants are designed to cool down a complete cargo of fruit and/or vegetables to the required temperature of transportation
- QUICKFREEZE** for the refrigerating plants of fishing vessels and fish factory ships where the design and equipment of such plants have been recognised suitable to permit quick-freezing of fish in specified conditions.

## 6.10 Navigation in cold environment

### 6.10.1 Notations ICE CLASS IA SUPER, ICE CLASS IA, ICE CLASS IB and ICE CLASS IC

The following notations are relevant to ships strengthened for navigation in ice in accordance with the "Finnish-Swedish Ice Class Rules 1985 as amended":

- **ICE CLASS IA SUPER** for ships with such structure, engine output and other properties that they are normally capable of navigating in difficult ice conditions without the assistance of icebreakers
- **ICE CLASS IA** for ships with such structure, engine output and other properties that they are capable of navigating in difficult ice conditions, with the assistance of icebreakers when necessary
- **ICE CLASS IB** for ships with such structure, engine output and other properties that they are capable of navigating in moderate ice conditions, with the assistance of icebreakers when necessary
- **ICE CLASS IC** for ships with such structure, engine output and other properties that they are capable of navigating in light ice conditions, with the assistance of icebreakers when necessary.

The requirements for the assignment and maintenance of these notations are given respectively in Part F, Chapter 8 and in Ch 5, Sec 10.

These requirements reproduce the provisions of the Finnish-Swedish Ice Class Rules cited above.

Note 1: These National requirements are applicable for ships trading in the Finnish/Swedish waters and other relevant areas of the Baltic sea during the ice period.

### 6.10.2 Notations ICE CLASS ID and YOUNG ICE

The additional class notations **ICE CLASS ID**, **YOUNG ICE 1** and **YOUNG ICE 2** are assigned to ships whose reinforcements for navigation in ice are different from those required for the assignment of the notations defined in [6.10.1] but who comply with the specific requirements detailed in Part F, Chapter 8.

Note 1: No minimum engine output is required for these notations.

The requirements for maintenance of these notations are given respectively in Ch 5, Sec 10.

### 6.10.3 Notation ICE

The additional class notation **ICE** is assigned to ships whose reinforcements for navigation in ice are similar but not equivalent to those required for the assignment of the notations defined in [6.10.1] and [6.10.2], when this has been specially considered by the Society.

The requirements for maintenance of these notations are given respectively in Ch 5, Sec 10.

### 6.10.4 Ships operating in cold weather conditions

The additional class notations **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)** are assigned to ships intended to operate in cold climate environments as specified in Note 1.

Note 1:

- sea water temperature: not below -2°C
- wind speed: not higher than 30 knots.

The additional class notation **COLD DI** is assigned to ships operating in cold climate environments for shorter periods, not necessarily including ice covered waters and fitted with systems and equipment for de-icing.

The additional class notation **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)** is assigned to ships operating in cold weather conditions and which are built and fitted with systems and equipment for de-icing where t<sub>DH</sub> and t<sub>DE</sub> are defined, respectively for hull and equipment exposed to low air temperature, by:

- t<sub>DH</sub> : Lowest mean daily average air temperature in the area of operation, in °C, to be considered for the hull exposed to low air temperature, provided by the ship designer
- t<sub>DE</sub> : Lowest design external air temperature in the area of operation, in °C, to be considered for the equipment exposed to low air temperature, provided by the ship designer. This temperature can be set to about 20°C below the lowest mean daily average air temperature if information for the relevant trade area is not available.

The requirements for the assignment and maintenance of these notations are given respectively in Pt F, Ch 8, Sec 4 and in Ch 5, Sec 10.

### 6.10.5 Liquid cold cargoes (COLD CARGO)

The additional class notation **COLD CARGO** is assigned to ships having one of the service notation **oil tanker**, **product tanker** or **chemical tanker** intended to be loaded with liquid cargoes:

- having a cargo temperature below -10°C, in particular when loading is from cold storage tanks (winter conditions), and
- not needing to be heated in normal operating conditions.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 8, Sec 4 and in Ch 5, Sec 10.

## 6.11 Navigation in polar waters

**6.11.1** The notations dealt with under [6.11.2] are relevant to ships intended for navigation in ice-infested polar waters, except icebreakers.

The requirements for the assignment of these notations are given in Rule Note NR527 Rules for the Classification of POLAR CLASS and ICEBREAKER Ships.

Ships complying with the requirements of Rule Note NR527 and assigned with one of the additional class notations **POLAR CLASS** are also to comply with the requirements for the assignment of the additional class notation defined in [6.10.4]: **COLD** (H  $t_{DH}$ , E  $t_{DE}$ ).

Note 1: Icebreaker refers to any ship having an operational profile that includes escort or ice management functions, having powering and dimensions that allow it to undertake independent operations in ice covered waters.

Note 2: Ships with the additional class notation **POLAR CLASS 6** or **POLAR CLASS 7** and not intended to operate in low air temperature may be exempted of the additional class notation **COLD** (H  $t_{DH}$ , E  $t_{DE}$ ).

**6.11.2** The following additional class notations are assigned:

- **POLAR CLASS 1** for year-round operations in all polar waters
- **POLAR CLASS 2** for year-round operations in moderate multi-year ice conditions
- **POLAR CLASS 3** for year-round operations in second-year ice which may include multi-year ice conditions
- **POLAR CLASS 4** for year-round operations in thick first-year ice which may include old ice inclusions
- **POLAR CLASS 5** for year-round operations in medium first-year ice which may include old ice inclusions
- **POLAR CLASS 6** for summer/autumn operations in medium first-year ice which may include old ice inclusions
- **POLAR CLASS 7** for summer/autumn operations in thin first-year ice which may include old ice inclusions.

## 6.12 Lifting appliances

**6.12.1** Ships fitted with lifting appliances meeting the requirements of NR526 Rules for the Certification Lifting Appliances onboard Ships and Offshore Units may be assigned the following additional class notations:

- a) **ALP** for appliances intended to be used at harbour, for loading or unloading cargoes, equipment, spare parts or consumable
- b) **ALM** for appliances intended to be used in offshore conditions for various lifting operations exclusive of the appliances mentioned in item a).

Note 1: Ships fitted with lifting appliances used in harbour or in similar conditions for lifting operations other than ships loading or unloading may be assigned the additional service notation **ALP**.

**6.12.2** The additional class notations (**ALP**) or (**ALM**) may be assigned by the Society in lieu of the notations **ALP** or **ALM** respectively, when the corresponding lifting appliances meet the requirements of specific National Regulations under the conditions defined in NR526.

**6.12.3** The additional class notation **ALM** may be completed by:

- **-EN**, when lifting appliances are in compliance with additional specific safety requirements as defined in NR526
- **-SUBSEA**, when lifting appliances are intended to be used for lifting of subsea equipment in compliance with some specific requirements.

**6.12.4** The additional class notations **ALP**, **ALM**, **ALM-EN** and **ALM-SUBSEA** may be completed by **-MR** when, in addition, lifting appliances are intended to be used for lifting of personnel.

**6.12.5** The additional class notations **ALP**, **ALM**, (**ALP**), (**ALM**), **ALM-EN** or **ALM-SUBSEA** are optional. However, the Society may require the compliance of lifting appliances with the assigning conditions of one of the above mentioned additional class notations for the classification of ships, when one or several lifting appliances are of a primary importance for their operation, or when such appliances significantly influence their structure. As a rule, such is the case for the shear leg pontoons, crane pontoons, crane vessels and when the lifting appliances concerned have special high capacities, for example in case of ships specially equipped for handling very heavy loads.

**6.12.6** In compliance with [6.1.3], these notations are assigned a construction mark as defined in [3].

**6.12.7** The requirements for assignment and maintenance of these notations are given in NR526.

## 6.13 Emergency response service (ERS)

### 6.13.1 General

The notations dealt with under this Article are related to the provision of technical assistance in case of a maritime accident at sea by providing information on their remaining strength and stability in the resulting damaged condition.

The requirements for the assignment and maintenance of these notations are given in NR556 (Emergency Response Service).

### 6.13.2 ERS-S (Strength), ERS-H (Hydrodynamic), ERS-M (Mooring), [ERS-S] (Strength-partial), [ERS-H] (Hydrodynamic-partial) and [ERS-M] (Mooring-partial) services

**ERS-S** corresponds to damage longitudinal strength and damage stability analyses. It aims at providing information on the remaining hull strength and stability after the accident.

**ERS-H** aims at providing limits of navigation, based on direct calculations of vertical wave bending moment and vertical wave shear force for the accidental site sea-states, instead of empirical rule formulae. It is only applied in complement to **ERS-S**. It aims at providing maximum environmental conditions (Hs), heading restriction, or speed limit. These limits of navigation are given for hull girder strength only.

**ERS-M** corresponds to damaged mooring analyses for permanently moored units. It aims at providing information on the remaining capacities of the mooring system after the failure of one or several mooring lines and the potential failure of an additional mooring line.

**[ERS-S]**, **[ERS-H]** and **[ERS-M]** are assigned to ships until the respective ERS service becomes fully effective. The Society will provide service in case of damage as far as possible depending on the available information.

Note 1: The notations **[ERS-S]**, **[ERS-H]** and **[ERS-M]** are replaced respectively by **ERS-S**, **ERS-H** and **ERS-M** when all necessary information has been made available to the Society allowing the service to become fully effective.

## 6.14 Protection against chemical, biological, radiological or nuclear risks

### 6.14.1 Chemical, biological, radiological or nuclear hazards

The additional class notation **CBRN** may be assigned to civilian ships intended for operations in atmospheres contaminated by chemical, biological or nuclear hazardous material for rescue or damage control purposes and equipped with a citadel with a collective protection system that effectively protects people inside from contamination thanks to its dedicated ventilating system.

The additional class notation **CBRN-WASHDOWN** may be assigned to ships which, in addition to the above features, are provided with a wash-down system that will give increased protection during CBRN operations and will also allow immediate primary decontamination of the superstructures.

The requirements for the assignment and maintenance of these notations are given respectively in Part F, Chapter 10 and in Ch 5, Sec 11.

### 6.14.2 Biological risk control

The additional class notations **BIORISK MANAGED** and **BIORISK SECURED** may be assigned to ships where measures improving the ability to prevent and manage an infectious disease outbreak are implemented.

The additional class notation **BIORISK MANAGED** may be assigned when an outbreak management plan is established for the ship and implemented on board.

The additional class notation **BIORISK SECURED** may be assigned when, in addition to the above-mentioned outbreak management plan, systems and arrangements are provided on board in order to support the management of an infectious disease outbreak.

The requirements for the assignment and the maintenance of these additional class notations are given respectively in Pt F, Ch 10, Sec 6 and in Ch 5, Sec 11, [3].

## 6.15 Manoeuvring, mooring, anchoring and position keeping

### 6.15.1 Ship manoeuvrability

The additional class notation **MANOVR** may be assigned to ships complying with the requirements related to manoeuvring capability defined in Pt F, Ch 11, Sec 1.

Note 1: According to Resolution MSC.137(76), these provisions are to be applied to ships of all rudder and propulsion types, of 100 m in length and over, and to chemical tankers and gas carriers regardless of the length, which were constructed on or after 1 January 2004.

### 6.15.2 Heading control

The additional class notations **HEADING CONTROL** may be assigned to ships arranged with redundant propulsion and steering systems in order to maintain their heading to the waves in adverse weather conditions and to avoid large transversal accelerations, taking into account the windage of the deck cargo if any.

The additional class notation **HEADING CONTROL** is complemented by:

-**DS** for ships with duplicated propulsion systems able to maintain their heading to the waves in case of single failure on the propulsion or steering system

-**IS** for ships with independent propulsion systems, which in addition to the requirements applicable to **-DS** notation, comply with additional requirements covering the event of fire or flooding casualty in machinery space.

The requirements for the assignment and the maintenance of these notations are given respectively in Pt F, Ch 11, Sec 2 and Ch 5, Sec 12, [2].

### **6.15.3 Single point mooring**

The additional class notation **SPM** (Single Point Mooring) may be assigned to ships fitted with a specific mooring installation.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 11, Sec 3 and in Ch 5, Sec 12.

These requirements reproduce the provisions of "Recommendations for Equipment Employed in the Bow Mooring of Conventional Tankers at Single Point Moorings" (4th edition - May 2007), issued by OCIMF (Oil Companies International Marine Forum).

### **6.15.4 UNSHELTERED ANCHORING**

The additional class notation **UNSHELTERED ANCHORING** is assigned to ships fitted with anchoring equipment in deep and unsheltered water complying with the requirements of Pt F, Ch 11, Sec 4, in addition to the requirements from Pt B, Ch 12, Sec 4, as applicable to equipment.

The requirements of this section apply to ships:

- with an equipment length  $L_E$ , as defined in Pt B, Ch 12, Sec 4, [1.2.2], greater than 135 m

and intended to anchor in deep and unsheltered water with:

- depth of water up to 120 m
- current speed up to 3 knots (1.54 m/s)
- wind speed up to 27 knots (14 m/s)
- waves with significant height up to 3 m.

The scope of chain cable, being the ratio between the length of chain paid out and water depth, is assumed to be to the maximum possible and not less than 3.

### **6.15.5 Dynamic positioning**

The additional class notation **DYNAPOS** may be assigned to ships equipped with a dynamic positioning system.

In compliance with [6.1.3], this notation is assigned a construction mark, as defined in Article [3].

The scope of the additional class notation **DYNAPOS**, including the additional notations for the description of capability of the installation (**SAM, AM, AT, AM/AT**), and the requirements for the assignment of this notation are given in Pt F, Ch 11, Sec 5.

The requirements for the maintenance of this notation are given in Ch 5, Sec 12.

The additional class notations **DYNAPOS AM/AT R** or **DYNAPOS AM/AT RS** may be completed by **-EI** for ships fitted with enhanced dynamic positioning control system and complying with the requirements of Pt F, Ch 11, Sec 5. This notation allows improving the reliability, availability and operability of a DP vessel.

The additional class notations **DYNAPOS** may be completed, by the notations **-HWIL** and/or **-DDPS** as follows:

- a) The notation **-HWIL** is added to the additional class notation **DYNAPOS** when the DP control system and the power management system have been verified according to the requirements of NR632, Hardware-in-the-loop Testing.
- b) The notation **-DDPS** is added to the additional class notation **DYNAPOS** when the ship is fitted with a system which enables the vessel to undertake digital surveys in compliance with Pt F, Ch 11, Sec 6, [11].

The notation **-DDPS** allows the ship's crew to conduct tests, proving the ability of a DP vessel to keep position after single failures associated with the assigned equipment class and to validate the FMEA and operation manual, as a part of annual survey as laid down in Ch 5, Sec 12, [4.1.2] and only for this part, according to their own schedule within the window of the Annual Survey, with the results witnessed by the Society digitally.

Any test from the approved FMEA test programme not completed by ship's crew at the time of Surveyor's attendance for annual survey has to be carried out before completion of the survey.

A confirmatory survey, to be carried out by a Surveyor of the Society, is to be requested, when the ship is within the window for annual survey of its classed DP system.

The Surveyor carries out the annual survey as laid down in Ch 5, Sec 12, [4.1] and satisfies himself with the validation of the FMEA and operations manual, based on the reports/records provided by the ship's crew. If doubts arise, the Surveyor extend the tests as deemed necessary.

## 6.16 Cargo operation, securing and safety

### 6.16.1 Loading instrument

The additional class notations **LI-HG**, **LI-S1**, **LI-S2**, **LI-S3**, **LI-S4**, **LI-HG-S1**, **LI-HG-S2**, **LI-HG-S3**, **LI-HG-S4** and **LI-LASHING** may be assigned to ships equipped with a loading instrument.

The requirement for the assignment of these notations are given in Pt B, Ch 1, Sec 5.

Note 1: When the ship is equipped with a loading instrument performing:

- only hull girder calculations, the additional class notation **LI-HG** is assigned
- only intact stability calculations (when the ship is not required to meet damage stability requirements), the additional class notation **LI-S1** is assigned
- intact stability calculations and damage stability on a basis of a limit curve, the additional class notation **LI-S2** is assigned
- intact stability calculations and direct damage stability calculations based on pre-programmed damage cases, the additional class notation **LI-S3** is assigned
- damage stability calculations associated with an actual loading condition and actual flooding case, using direct application of user defined damage, for the purpose of providing operational information for safe return to port (SRtP), the additional class notation **LI-S4** is assigned
- lashing calculations, the additional class notation **LI-LASHING** is assigned.

When the loading instrument performs hull girder and stability calculations, one of the additional class notations **LI-HG-S1**, **LI-HG-S2** or **LI-HG-S3**, **LI-HG-S4** is assigned, as applicable.

### 6.16.2 SINGLEPASSLOADING

The additional class notation **SINGLEPASSLOADING** may be assigned to ships having the service notation **ore carrier** which are specially designed for single pass loading.

Note 1: This additional class notation may be completed by the design loading rate, in tons per hour, for example:

**SINGLEPASSLOADING** [xxxxx t/h]

The additional class notation **SINGLEPASSLOADING** only covers the loading sequences provided to the Society, as referred to in Pt F, Ch 12, Sec 1.

The requirements for the assignment of this notation are given in Pt F, Ch 12, Sec 1.

### 6.16.3 Bow loading/unloading systems (BLUS) - Stern loading/unloading systems (SLUS)

The additional class notations **BLUS** or **SLUS** may be assigned to ships having the service notation **oil tanker** and fitted with bow or stern loading/unloading systems.

The requirements for the assignment of these notations are given in Pt F, Ch 12, Sec 2.

### 6.16.4 Supply at sea (SAS)

The additional class notation **SAS** may be assigned to ships having the service notation **supply** and operated for underway ship-to-ship supply at sea (SAS) of liquid and solid supplies.

The requirements for the assignment of this notation are given in Pt F, Ch 12, Sec 3.

Note 1: Application to other service notations may be considered on a case-by-case basis.

### 6.16.5 Centralised cargo control

The additional class notation **CARGOCONTROL** may be assigned to ships (carrying liquid cargo in bulk) equipped with a centralised system for handling cargo and ballast liquids.

In principle, this notation is assigned only to ships having the service notation **oil tanker, combination carrier/OBO, combination carrier/OOC, chemical tanker** or **FLS tanker**.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 12, Sec 4 and in Ch 5, Sec 13.

### 6.16.6 Container lashing equipment

The additional class notation **LASHING** may be assigned to ships initially fitted with mobile container lashing equipment which has been documented, tested and checked.

The additional class notation **LASHING-RSSA( )** may be assigned in lieu of the notation **LASHING** to ships which may be engaged in voyages on specific routes or in specific areas. The specific routes and specific areas are to be indicated between brackets (e.g.: **LASHING-RSSA(Asia-Europe through Mediterranean sea; Baltic sea)**).

The additional class notations **LASHING** and **LASHING-RSSA( )** may be completed by the notation **-WAF** when the ship is also engaged in short voyages (less than 72 hours) and provided with weather dependent lashing procedures.

These notations are assigned only to ships having the service notation **container ship** or the additional service feature **equipped for carriage of containers**.

This equipment, however, will not be verified any longer at the periodical class surveys to which the ship is submitted.

The requirements for the assignment of these notations are given in Pt F, Ch 12, Sec 5.

### **6.16.7 SAFE-LASHING**

The additional class notation **SAFE-LASHING** may be assigned to ships having the service notation **container ship** or the additional service feature **equipped for carriage of containers** and the keel of which was laid, or which are at a similar stage of construction, on or after 1 January 2015.

The requirements for the assignment of this notation are given in IMO MSC.1/Circ.1352/Rev.1 "Amendments to the Code of Safe Practice for Cargo Stowage and Securing (CSS Code)", Annex 14 "Guidance on Providing Safe Working Conditions for Securing of Containers on Deck", paragraphs 4.3 "Cargo Safe Access Plan (CSAP)" and 6 "Design".

### **6.16.8 Parametric roll assessment (PaRoll)**

The additional class notation **PaRoll1** or **PaRoll2** may be assigned to container ships, for which numerical simulations and operational guidance (polar plot) for evaluation of maximum dynamic roll angle (including parametric roll) in various loading conditions and sea states are developed in compliance with NR667.

- The additional class notation **PaRoll1** is granted to ships using only bilge keels as anti-rolling devices
- The additional class notation **PaRoll2** is granted to ships using anti-rolling devices such as anti-roll tank, stabilizer fins or any anti-rolling devices different from bilge keels.

The requirements for the assignment and maintenance of this notation are given respectively in NR667 and Ch 5, Sec 13.

### **6.16.9 Open hatch**

The additional class notation **OPEN-HATCH** may be assigned to ships granted with the service notation **general cargo ship** or **container ship** and intended to undertake sea voyage with one or several hatch covers not in place, as defined in Pt F, Ch 12, Sec 6.

The requirements for the assignment and maintenance of this additional class notation are given respectively in Pt F, Ch 12, Sec 6 and in Ch 4, Sec 7.

### **6.16.10 Efficient washing of cargo tanks**

The additional class notation **EWCT** may be assigned to ships fitted with washing arrangements complying with the requirements given in Pt F, Ch 12, Sec 7.

This notation may only be assigned to ships having the service notation **oil tanker, FLS tanker, or chemical tanker**.

### **6.16.11 Sealed liquefied natural gas tanks**

The additional class notation **IATP** (increased admissible cargo tank pressure) may be assigned to ships or units intended to carry or store methane (LNG) whose maximum cargo tank design pressure does not exceed 70 kPa and that are designed and built so as to allow the pressure in the tanks to increase above 25 kPa.

The additional class notation **IATP** is to be complemented, between brackets, by one of the following notations:

- **dual setting**, when a dual setting of the cargo tanks pressure relief valves is installed, or
- **boil-off**, when a boil-off handling system whose available capacity can be lower than 100% of the nominal boil-off rate of the ship during the periods referred to in Pt F, Ch 12, Sec 8, [4.3.2] is installed,
- **dual setting and boil-off**, when both systems are installed.

The requirements for the assignment of this notation are given in Pt F, Ch 12, Sec 8.

Note 1: In case of dual setting of the cargo tanks pressure relief valves, the operational conditions and limitations for both setting pressures are to be specified in a memorandum.

### **6.16.12 Electric vehicles onboard charging (EVOC)**

The additional class notation **EVOC** may be assigned to ships having the service notation **ro-ro passenger ship**, carrying electric vehicles intended to be charged on board.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 12, Sec 9 and Ch 5, Sec 13.

## **6.17 Additional notations for stability**

### **6.17.1 Ship subdivision and damage stability**

The additional class notation **SDS** may be assigned to ships for which a damage buoyancy, subdivision and stability file has been examined and found to satisfy the requirements given in Pt B, Ch 3, Sec 3 or those required for granting the service notation, when applicable.

An attestation of compliance may be issued to the Interested Party, specifying the rules and criteria considered for the examination of the file.

Note 1: As a rule, class assigned to a ship does not cover requirements applicable to the assignment of the notation **SDS**.

### **6.17.2 STABLIFT**

The additional class notation **STABLIFT** may be assigned to ships engaged in lifting operations at sea and equipped for that purpose with one or several lifting equipment, having their residual stability during lifting operations checked and complying with the stability requirements specified in Pt E, Ch 8, Sec 3.

### 6.17.3 STAB-WIND

The additional class notation **STAB-WIND** may be assigned, to yacht having the service notation **yacht** or **charter yacht** satisfying the intact stability and weather criterion as defined in Rule Note NR500 Rules for the Classification and the Certification of Yachts.

Note 1: The attention of the Owner and the Shipyard is drawn to the fact that the flag Administration may impose an intact stability and weather criterion calculation.

## 6.18 Additional notations for hull structure assessment

### 6.18.1 Strengthened bottom

The additional class notation **STRENGTHBOTTOM** may be assigned to ships built with specially strengthened bottom structures so as to be able to be loaded and/or unloaded when properly stranded.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 15, Sec 1 and in Ch 5, Sec 14.

### 6.18.2 Loading by grabs

a) Loading by grabs for bulk carriers subject to NR522 Common Structural Rules for Bulk Carriers or to NR606 Common Structural Rules for Bulk Carriers and Oil Tankers.

The additional class notation **GRAB [X]** is assigned to ships with holds designed for loading/unloading by grabs having a maximum specific weight up to [X] tons.

The requirements for the assignment of this notation are given in NR522 Common Structural Rules for Bulk Carriers or in NR606 Common Structural Rules for Bulk Carriers and Oil Tankers.

The requirements for the maintenance of this notation are given in Ch 5, Sec 14.

Note 1: It is reminded that for bulk carriers assigned with the additional service feature **CSR**, and one of the additional service features **BC-A** or **BC-B**, **GRAB [X]** is assigned as a mandatory additional service feature.

For bulk carriers assigned with the additional service feature **CSR** others than above, **GRAB [X]** may be assigned on a voluntary basis as an additional class notation.

It is to be noted that this additional class notation does not negate the use of heavier grabs, but the owner and operators are to be made aware of the increased risk of local damage and possible early renewal of inner bottom plating if heavier grabs are used regularly or occasionally to discharge cargo.

b) Loading by grabs for ships other than those subject to NR522 Common Structural Rules for Bulk Carriers or to NR606 Common Structural Rules for Bulk Carriers and Oil Tankers.

The additional class notation **GRABLOADING** may be assigned to ships with hold tank tops specially reinforced for loading/unloading cargoes by means of grabs or buckets.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 15, Sec 2 and in Ch 5, Sec 14.

Note 2: This additional class notation may only be assigned to ships with the service notation **general cargo ship** (intended to carry dry bulk cargoes), **ore carrier**, **combination carrier/OBO**, **combination carrier/OOC** or **bulk carrier** not assigned with the additional service feature **CSR**.

However, this does not preclude ships not assigned with this notation from being loaded/unloaded with grabs.

### 6.18.3 Spectral fatigue analysis

The additional class notation **Spectral Fatigue** ( ) may be assigned when the fatigue check of structural details is performed through spectral fatigue techniques. The information between brackets is a short description of routes and areas considered for this spectral fatigue analysis and associated design fatigue life.

Example: **Spectral Fatigue (North Atlantic)**

The Guidance Note NI 611, Guidelines for Fatigue Assessment of Steel Ships and Offshore units, is to be used.

Other methodology may be used, subject to approval by the Society.

### 6.18.4 Whipping and springing assessment

The additional class notations **WhiSp1**, **WhiSp2** and **WhiSp3** may be assigned to ships complying with the requirements of NR583 Whipping and Springing Assessment.

## 6.19 Additional notations for fire protection

### 6.19.1 Enhanced fire protection

The additional class notation **EFP-A** or **EFP-M** or **EFP-C** or **EFP-AMC** may be assigned to ships fitted with enhanced fire safety protection in, respectively, accommodation spaces or machinery spaces or cargo areas or all these spaces and areas.

The notations **EFP-A**, **EFP-C** and **EFP-AMC** may only be assigned to ships having one of the service notations listed in [4.2] (Cargo ships), or [4.3] (Bulk, ore and combination carriers), or [4.4] (Ships carrying liquid cargo in bulk). The notation **EFP-M** may be assigned to ships having one of the service notations listed in [4.2] (Cargo ships), or [4.3] (Bulk, ore and combination carriers), or [4.4] (Ships carrying liquid cargo in bulk), or [4.5] (Ships carrying passengers).

The requirements for the assignment of these notations are given respectively in Pt F, Ch 13, Sec 1.

The requirements for the maintenance of the notations **EFM** and **EFM-AMC** are given in Ch 5, Sec 16, [2].

### 6.19.2 Enhanced cargo fire protection for container ships

The additional class notations **ECFP** may be assigned to ships fitted with equipment, systems and arrangements improving the ability to manage a container cargo fire, as follows:

- **ECFP-1**, when the ship is fitted with portable equipment and arrangements, as per Pt F, Ch 13, Sec 2, [2], that may be considered as retrofit for an existing ship
- **ECFP-2**, when, in addition to the requirements for the notation **ECFP-1**, the ship is fitted with equipment, systems and arrangements, as per Pt F, Ch 13, Sec 2, [3], which constitute an extensive set of mitigation measures which are deemed effective and available with standard technologies
- **ECFP-3**, when, in addition to the requirements for the above mentioned notations, the ship is fitted with equipment, systems and arrangements, as per Pt F, Ch 13, Sec 2, [4], which include measures that are deemed relevant using innovative technologies.

In general, the additional class notations **ECFP-1**, **ECFP-2** or **ECFP-3** may be granted to ships assigned with the service notation **container ship**. In general, the additional class notation **ECFP-1** may also be granted to ships having the additional service feature - **equipped for the carriage of containers**.

The additional class notations **ECFP-2** and **ECFP-3** are to be completed by the following notation (**Area 1, X<sub>1m</sub> ; ... ; Area n, X<sub>nm</sub>**), where:

- **Area n** indicates the cargo holds where the maximum flooding level X<sub>n</sub> is allowed,
- **X<sub>n</sub>**, corresponds to the maximum flooding level in area n, in meters, with respect to the bottom of the hold.

Examples:

**ECFP-2(All cargo holds, 20m)**

**ECFP-3(Holds 1 to 4, 16m; Holds 5 to 8, 20m; Holds 9 to 12, 15m)**

The requirements for the assignment and the maintenance of these notations are given respectively in Pt F, Ch 13, Sec 2 and in Ch 5, Sec 16, [3].

### 6.19.3 Cofferdam ventilation

The additional class notation **COVENT** may be assigned to ships having cofferdams in the cargo area which can be used as ballast tanks and which may be ventilated through a fixed ventilation system.

This notation is assigned only to ships having the service notation **bulk carrier, ore carrier, oil tanker, combination carrier/OBO, combination carrier/OOC, liquefied gas carrier, chemical tanker** or **FLS tanker**.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 13, Sec 3 and in Ch 5, Sec 16.

## 6.20 Electric propulsion or electric power supply

### 6.20.1 BATTERY SYSTEM

The additional class notation **BATTERY SYSTEM** may be assigned to ships when batteries are used for propulsion and/or electric power supply purpose during operation of the ship. This notation is mandatory when the ship is only relying on batteries for propulsion and/or electrical power supply for main sources.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 14, Sec 1 and Ch 5, Sec 15.

Note 1: when a ship is assigned the additional class notation **ELECTRIC HYBRID ( )**, it is not necessary to assign the additional class notation **BATTERY SYSTEM**.

### 6.20.2 Electric hybrid

The additional class notation **ELECTRIC HYBRID ( )** may be assigned to ships provided with an energy storage system (ESS) used to supply the electric propulsion and/or the main electrical power distribution system of the vessel.

The additional class notation **ELECTRIC HYBRID ( )** is to be completed, between brackets, by at least one of the following notation:

- **PM**, when at least one of the following power management mode is available: load smoothing mode, peak shaving mode or enhanced dynamic mode
- **PB**, when power backup mode is available
- **ZE**, when zero emission mode is available.

The requirements for the assignment and maintenance of this notation are given in Pt F, Ch 14, Sec 2 and Ch 5, Sec 15.

Example:

**ELECTRIC HYBRID (PM, ZE)**.

### 6.20.3 Electric hybrid prepared

The additional class notation **ELECTRIC HYBRID PREPARED** ( ) may be assigned to new ships that are designed with specific arrangements intended to accommodate an Electric Hybrid installation in the future.

The additional class notation **ELECTRIC HYBRID PREPARED** ( ) is to be completed, between brackets, by at least one of the following notation:

- **PM**, when at least one of the following power management mode is available: load smoothing mode, peak shaving mode or enhanced dynamic mode
- **PB**, when power backup mode is available
- **ZE**, when zero emission mode is available.

The requirements for the assignment of this notation are given in Pt F, Ch 14, Sec 3.

Example:

**ELECTRIC HYBRID PREPARED (PM, ZE).**

### 6.20.4 Hybrid mechanical propulsion

The additional class notation **HYBRID MECHANICAL PROPULSION** may be assigned to ships provided with a propulsion plant which combines a diesel mechanical system and an electric system.

The requirements for the assignment and the maintenance of this notation are given respectively in Pt F, Ch 14, Sec 4, and in Ch 5, Sec 15, [4].

### 6.20.5 High-voltage shore connection systems (HVSC)

The additional class notation **HVSC** may be assigned to ships fitted with electrical and control engineering arrangements allowing operation of services by connection to an external high-voltage electrical power supply in port.

The requirements for the assignment of this notation are given in NR557 High-Voltage Shore Connection Systems.

### 6.20.6 High-voltage shore connection prepared ships (HVSC-PREPARED)

The additional class notation **HVSC-PREPARED** may be assigned to ships designed with specific arrangements to accommodate a high-voltage shore connection installation at a later stage.

The additional class notation **HVSC-PREPARED** may be completed by **-C** when the cables for connection between the shore connection receiving box and the ship main switchboard and to the relevant electrical pieces of equipment (e.g. transformer) are already installed on board.

The requirements for the assignment of this notation are given in Pt F, Ch 14, Sec 5.

## 6.21 Cyber security

**6.21.1** The additional class notations **CYBER MANAGED**, **CYBER RESILIENT** and **CYBER SECURE** may be assigned to ships that are equipped with systems and equipment which comply with the requirements of NR659 Rules on Cyber Security for the Classification of Marine Units.

- The additional class notation **CYBER MANAGED** covers cyber security measures implemented mainly with the administrative control based on operator actions subject to procedures and policies. The additional class notation **CYBER MANAGED** may be assigned to ships compliant with the set of requirements for critical equipment management, crew training, remote access and change management.
- The additional class notation **CYBER RESILIENT** covers cyber security measures implemented with the administrative and engineering controls subject to the requirements for procedures, software and hardware design. The additional class notation **CYBER RESILIENT** may be assigned to ships compliant with the minimum requirements regarding ships resilience when dealing with cyber-attacks.
- The additional class notation **CYBER SECURE** covers cyber security measures implemented mainly with the engineering control based on the software and hardware. The additional class notation **CYBER SECURE** may be assigned to ships compliant with the set of requirements for cyber management, equipment hardening and overall design of the systems to guarantee a defence in depth.

In compliance with [6.1.3], the additional class notation **CYBER RESILIENT** and **CYBER SECURE** are assigned a construction mark, as defined in Article [3].

The requirements for the assignment of notations **CYBER MANAGED**, **CYBER RESILIENT** and **CYBER SECURE** are given in NR659 Rules on Cyber Security for the Classification of Marine Units.

The requirements for the maintenance of the notations **CYBER MANAGED**, **CYBER RESILIENT** and **CYBER SECURE** are given in Ch 5, Sec 17.

Note 1: Ships already granted with the additional class notation **CYBER MANAGED PREPARED**, as defined in NR467 Rules for the Classification of Steel Ships July 2022 edition, may be assigned the additional class notation **CYBER MANAGED** upon satisfactorily compliance with the relevant parts of NR659.

## 6.22 Sustainable ships

**6.22.1** The additional class notations **SUSTAINABLESHIP-1** or **SUSTAINABLESHIP-2** may be assigned to ships that are designed, built and equipped according to the requirements laid down in Pt F, Ch 15, Sec 8, focusing on the following sustainability aspects:

- prevention of sea and air pollution
- protection of the marine environment
- reduction of greenhouse gases emissions
- preparation for ship recycling
- enhancement of people well-being on board.

The requirements for the assignment of the additional class notations **SUSTAINABLESHIP-1** and **SUSTAINABLESHIP-2** are those corresponding to a combination of notations, their applicable associated requirements and any additional requirements, covering the sustainability aspects as defined in Pt F, Ch 15, Sec 8.

The maintenance of the additional class notations **SUSTAINABLESHIP-1** and **SUSTAINABLESHIP-2** are those respectively applicable to each required notations of the combination.

## 6.23 Smart systems (SMART)

**6.23.1** The additional class notation **SMART()** may be assigned to ships fitted with computerized based systems that incorporate smart functions for collection, transmission, analysis and visualisation of data.

These smart functions may be related to operation or maintenance of ships and may include monitoring, decision making support, remote monitoring, maintenance from shore or remote operation of systems.

The additional class notation **SMART()** is to be completed between brackets by at least one of the following notations indicating the scope of application of the smart function:

- **Hx** for Hull
- **Mx** for Machinery
- **MHx** for Machinery Health Monitoring
- **Nx** for Navigation
- **EnEx** for Energy Efficiency
- **Lx** for Electronic Logbook
- **Xx** for Special smart function

where **x** indicates the smart group designation and can take one of the following values:

- **1** for “Computer Based ship”, i.e. for ships equipped with at least one smart system, which is in accordance with requirements related to computer based systems and smart functions as specified in the relevant Sections of NR675
- **2** for “Connected ship”, i.e. for ships equipped with at least one smart system, which is in accordance with smart group **1** requirements and with additional requirements related to data infrastructures, ship-shore data communication and cybersecurity as specified in the relevant Sections of NR675
- **3** for “Augmented ship”, i.e. for ships equipped with at least one smart system, which is in accordance with smart group **1** requirements and with additional requirements related to Shore Digital Solutions (SDS) as specified in the relevant Sections of NR675.

Note 1: For **Lx** the attention of the Owner is drawn to the fact that the flag Administration may impose additional and/or more stringent requirements issued by the Administration of the State whose flag the ship is entitled to fly.

The notation **EnEx** may be complemented by one or by a combination of the following complementary notations: **-Em**, **-T**, **-LIT**, **-S**, **-W** and **-CII**.

Each smart system with a distinctive smart function may be assigned the smart group **1**, **2** or **3**.

Examples:

**SMART(H1)**

**SMART(MH2, N1, EnE3-LIT)**

The requirements for the assignment and maintenance of the additional class notation **SMART()** are given respectively in NR675 and Ch 5, Sec 17.

## 6.24 Corrosion protection

### 6.24.1 Coating performance standard CPS(COT)

The additional class notation **CPS(COT)** for cargo oil tanks may be assigned to ships complying with the requirements of NR530 Coating Performance Standard.

The requirements for the maintenance of this notation are given in Ch 5, Sec 18.

Note 1: **CPS(COT)** applies to cargo oil tanks of crude oil tankers of 5 000 tonnes deadweight and above.

### **6.24.2 Coating performance standard CPS(MFT)**

The additional class notation **CPS(MFT)** for methanol fuel tanks may be assigned to ships complying with the requirements of NR530 Coating Performance Standard.

The requirements for the maintenance of this notation are given in Ch 5, Sec 18.

### **6.24.3 Coating performance standard CPS(VSP)**

The additional class notation **CPS(VSP)** for void spaces may be assigned to bulk carriers and oil tankers complying with the requirements of NR530 Coating Performance Standard.

The requirements for the maintenance of this notation are given in Ch 5, Sec 18.

### **6.24.4 Coating performance standard CPS(WBT)**

The additional class notation **CPS(WBT)** for water ballast tanks may be assigned to ships complying with the requirements of NR530 Coating Performance Standard.

The requirements for the maintenance of this notation are given in Ch 5, Sec 18.

Note 1: For bulk carriers and oil tankers assigned the additional service feature **CSR** and contracted for construction on or after 8 December 2006, and for ships complying with IMO resolution MSC.215(82), as amended, and contracted for construction on or after 1 July 2008, reference is made to [4.3.2] and [4.4.2] for the mandatory assignment of the additional service feature **CPS(WBT)**.

## **6.25 Other additional class notations**

### **6.25.1 In-water surveys**

The additional class notation **INWATERSURVEY** may be assigned to ships provided with suitable arrangements to facilitate the in-water surveys as provided in Ch 2, Sec 2, [5.4.5].

The requirements for the assignment of this notation are given in Pt F, Ch 15, Sec 3.

### **6.25.2 Permanent means of access (ACCESS)**

The additional class notation **ACCESS** may be assigned to ships constructed on or after 1 January 2006 and:

- assigned with service notations as specified in [4.4.2] for ships carrying oil cargo in bulk and of 500 gross tonnage and over, having integral tanks, or
- assigned with service notations as specified in [4.3] for bulk, ore and combination carrier of 20 000 gross tonnage and over.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 15, Sec 4 and in Ch 5, Sec 19.

### **6.25.3 Helideck (HEL)**

The additional class notation **HEL** may be assigned to ships complying with chapter II-2 of SOLAS and Civil Aviation Publication (CAP) 437 when they are fitted with helicopter facilities subject to design review and construction and installation survey by the Society.

The requirements for the assignment and maintenance of this notation are given respectively in Pt F, Ch 15, Sec 5 and in Ch 5, Sec 19.

### **6.25.4 Helicopter facilities for yachts**

The additional class notation **HEL(Y)** may be assigned to ships assigned with service notation **yacht** or **charter yacht** fitted with helicopter facilities.

The requirements for the assignment of this notation are given in NR500, Rules for the Classification and Certification of Yachts.

### **6.25.5 Yachts equipped with a wind propulsion system**

Ships assigned the service notation **yacht** or **charter yacht**, and equipped with a wind propulsion system as defined in NR206, Sec 1, [2.1], may be assigned one of the following additional class notations:

- **WIND PROPULSION-1** when the safety rigging parts of the wind propulsion system are included in the scope of classification
- **WIND PROPULSION-2** when both the safety and the operating rigging parts of the wind propulsion system are included in the scope of classifications.

In compliance with [6.1.3], these notations are assigned a construction mark as defined in [3].

The requirements for the assignment and the maintenance of these notations are given respectively in NR206 Wind propulsion systems and in Ch 4, Sec 12.

Note 1: The safety rigging parts and operating rigging parts are defined in NR206, Sec 1, [2.2].

### **6.25.6 Offshore handling systems (OHS)**

The additional class notation **OHS** may be assigned to ships having offshore handling systems such as winches, strand jacks, chain jacks, sheaves and their foundations used for lifting/pulling of a load.

The requirements for the assignment and maintenance of this notation are given respectively in NR595 Classification of Offshore Handling Systems and in Ch 5, Sec 19.

Note 1: Specific procedures for non-permanent equipment are not applicable for ships.

### **6.25.7 Offshore access system (OAS)**

The additional class notation **OAS** may be assigned to ships fitted with an offshore access system, based on gangways and used for the transfer of persons from ships to offshore facilities or from ship to ship, certified in accordance with NI 629 Certification of Offshore Access Systems.

In compliance with [6.1.3], this notation is assigned a construction mark as defined in Article [3].

The requirements for the assignment and maintenance of this notation are given respectively in NI 629 Certification of Offshore Access Systems and in Ch 5, Sec 19.

### **6.25.8 Elastic shaft alignment (ESA)**

The additional class notation **ESA** may be assigned to ships other than those covered by the scope of the relevant additional service feature as referred to in [4.16.7].

The requirements for the assignment of this additional class notation are given in Rule Note NR592 Elastic Shaft Alignment (ESA).

Note 1: The request and applicability for this notation are achieved respectively on a voluntary basis from the interested parties and on a case-by-case basis.

### **6.25.9 LNGFUEL-PREPARED**

The additional class notation **LNGFUEL-PREPARED** may be assigned to new ships that are designed to accommodate future installation of an LNG fuel system.

The requirements for the assignment of this notation are given in Appendix 4 of NR529 Gas fuelled ships.

The additional class notation **LNGFUEL-PREPARED** may be completed, between brackets, by one or a combination of the following additional notations:

- **S**, when specific arrangements are implemented for the ship structure
- **A**, when specific arrangements for ventilation and access to gas-related spaces are already on board
- **P**, when specific arrangements are implemented for piping
- **ME-DF**, when the main engine(s) is (are) of the dual fuel type
- **AE**, when the auxiliary engines are either of the dual fuel type, or designed for future conversion to dual-fuel operation
- **B**, when the oil-fired boilers are either of the dual fuel type, or designed for future conversion to dual fuel operation.

Examples:

- **LNGFUEL-PREPARED**
- **LNGFUEL-PREPARED (P)**
- **LNGFUEL-PREPARED (P, ME-DF)**
- **LNGFUEL-PREPARED (S, P, ME-DF)**

Note 1: When the ship is effectively converted to dualfuel operation, the additional class notation **LNGFUEL-PREPARED** will be replaced by the additional service feature **LNGfuel dualfuel**, provided that all the applicable requirements given in [4.16.4] are complied with.

### **6.25.10 AMMONIAFUEL-PREPARED**

Ships designed to accommodate future installation of an ammonia fuel system may be granted the additional class notation **AMMONIAFUEL-PREPARED**.

The additional class notation **AMMONIAFUEL-PREPARED** may be completed between brackets by one or a combination of notations **S**, **A**, **T**, **H**, **P** and **B**:

- **S**, when specific arrangements are implemented for the ship structure at the original design stage with the aim of preventing the need for specific structural modifications at the later stage
- **A** when specific arrangements for ventilation and access to ammonia related spaces are already on board
- **T**, when at least one original LNG or LPG fuel storage tank can also be used with ammonia fuel, possibly with modifications of the operational conditions of the tank at the later stage
- **H**, when the original LNG or LPG fuel handling equipment (pumps, heat exchangers, compressors) can also be used with ammonia
- **P**, when the original LNG or LPG piping system can also be used with ammonia
- **B**, when the original LNG or LPG boil-off gas management method (other than pressure accumulation, i.e. combustion unit, boiler, scrubbing system or refrigerating system) can also be used with ammonia.

Examples:

**AMMONIAFUEL-PREPARED**

**AMMONIAFUEL-PREPARED (T)**

**AMMONIAFUEL-PREPARED (S,T,H)**

The requirements for the assignment of this additional class notation are given in NR671 Ammonia-fuelled ships.

**6.25.11 METHANOLFUEL-PREPARED**

Ships designed to accommodate future installation of a methanol fuel system may be assigned the additional class notation **METHANOLFUEL-PREPARED**.

The additional class notation **METHANOLFUEL-PREPARED** may be completed between brackets by one or a combination of notations **S, T, H, P, ME-DF, AE, B**:

- **S**, when the ship structure is designed and built with specific arrangements at new construction stage with the aim of preventing the need for specific structural modifications at a later stage
- **T**, when at least one original fuel storage tank can be used with methanol fuel, possibly with modifications of the operational conditions of the tank at a later stage
- **H**, when the original fuel handling equipment can be used with methanol
- **P**, when the original piping system can be used with methanol
- **A**, when specific arrangements for ventilation and access to methanol-related spaces are already on board
- **ME-DF**, when the main engine(s) is (are) of the dual fuel type approved for methanol
- **AE**, when the auxiliary engines either are of a dual fuel type approved for methanol, or designed for future conversion to dual fuel operation
- **B** when the oil-fired boilers are either of a dual fuel type approved for methanol, or designed for future conversion to dual fuel operation.

Examples:

**METHANOLFUEL-PREPARED**

**METHANOLFUEL-PREPARED (T)**

**METHANOLFUEL-PREPARED (S,T,H).**

The requirements for the assignment of this additional class notation are given in NR670.

**6.25.12 HYDROGENFUEL-PREPARED**

Ships designed to accommodate future installation of a hydrogen fuel system may be assigned the additional class notation **HYDROGENFUEL-PREPARED**.

The additional class notation **HYDROGENFUEL-PREPARED** may be completed between brackets by one or a combination of notations **S, A, TL or TG, HL or HG, PL or PG, B**:

- **S** when specific arrangements are implemented for the ship structure at the original design stage with the aim of preventing the need for specific structural modifications at the conversion stage
- **A** when specific arrangements for ventilation and access to hydrogen-related spaces are already on board
- **TL or TG** when at least one original fuel storage tank can also be used with hydrogen fuel respectively in its liquefied or gaseous form, possibly with modifications of the operational conditions of the tank at the ship conversion stage
- **HL or HG** when the original fuel handling equipment (pumps, heat exchangers, compressors) can also be used with hydrogen respectively in its liquefied or gaseous form
- **PL or PG** when the original piping system can also be used with hydrogen respectively in its liquefied or gaseous form

Note 1: The notations **PL** and **PG** are assigned for the whole piping system meaning that they are mutually exclusive.

- **B** when the original boil-off gas management method can also be used with hydrogen.

Examples:

**HYDROGENFUEL-PREPARED**

**HYDROGENFUEL-PREPARED (TL)**

**HYDROGENFUEL-PREPARED (TL, HL, PL, B)**

**HYDROGENFUEL-PREPARED (A, PG, B)**

The requirements for the assignment of this additional class notation are given in NR678.

**6.25.13 FSRU READY**

The additional class notation **FSRU READY** may be assigned to ships having the service notation **liquefied gas carrier** that are designed and built with specific arrangements in view of accommodating future installation of a regasification system.

The additional class notation **FSRU READY** may be completed between brackets by one, or by a combination, of the following notations:

- **P**, when specific arrangements for piping and process systems are taken into account during the initial design of the ship in order to consider additional capacity for a future conversion

- **R**, when the regasification system, or main pieces of equipment, are defined at the time of assignment of the notation
- **I**, when the ship is designed and built in order to allow on-site in-water survey without dry-docking once converted into FSRU and subject to acceptance from Authorities.

The requirements for the assignment of this notation are given in Pt F, Ch 15, Sec 7.

#### **6.25.14 Man overboard detection (MOB)**

The additional class notation **MOB** may be assigned to self-propelled ships arranged with means capable of automatically detecting a person going overboard and instantaneously alert the ship's personnel.

This notation developed for passengers ships may be assigned to cargo ships at the discretion of Society.

The requirements for the assignment of this notation are given in Pt F, Ch 15, Sec 6.

#### **6.25.15 Internal connectivity**

The additional class notation **INTERNAL CONNECTIVITY** may be assigned to ships for which the onboard network infrastructure enables internal connectivity.

The requirements for the assignment and the maintenance of this notation are given in Rule Note NR688 Internal Connectivity.

Note 1: The scope of this notation is limited to a list of Internal Connectivity Areas (ICAs) to be specified by the applicant.

This list of ICAs is to be indicated in a memorandum.

### **6.26 System fitted but not required by the rules**

#### **6.26.1 General**

The notations dealt with in this sub-article are assigned only when a system is installed on board, although the ship does not meet the conditions under which the Rules request it to be fitted.

#### **6.26.2 Inert gas**

The additional class notation **IG** may be assigned to ships fitted with an inert gas system, as follows:

- Ships contracted for construction before 1 January 2016:

This notation is assigned only to ships having the service notation:

- **oil tanker** or **FLS tanker**, and of less than 20000 tonnes deadweight, or
- **chemical tanker** for which an inert gas system is not required in pursuance of July 2014 edition of the Rules, Pt D, Ch 8, Sec 9, [1.3.1].

The requirements for the assignment of the notation **IG** are given in July 2014 edition of the Rules:

- Pt D, Ch 7, Sec 6, [5.1.2], for oil tankers or FLS tankers, and
- Pt D, Ch 8, Sec 9, [2.5.3], for chemical tankers.

- Ships contracted for construction on or after 1 January 2016:

This notation is assigned only to ships having the service notation **oil tanker**, **FLS tanker** or **chemical tanker**, and of less than 8000 tonnes deadweight.

The requirements for the assignment of the notation **IG** are given in:

- Pt D, Ch 7, Sec 6, [5.1.3], for oil tankers or FLS tankers, and
- Pt D, Ch 8, Sec 9, [2.3], for chemical tankers.

- This notation may be assigned to ships having the service notation **supply**.

The requirements for the assignment of the **IG** notation are given in Pt D, Ch 8, Sec 9, [2.3].

The requirements for the maintenance of the notation **IG** are given respectively:

- for **oil tanker** or **FLS tanker**, in Ch 4, Sec 3, [3.4]
- for **chemical tanker** or **supply**, in Ch 4, Sec 4, [3.4].

#### **6.26.3 Emergency towing arrangement (ETA)**

The additional class notation **ETA** may be assigned to ships fitted with an emergency towing arrangement.

In principle, this notation is assigned only to ships of less than 20000 tonnes deadweight having one of the service notations **oil tanker**, **combination carrier/OBO**, **combination carrier/OOC**, **liquefied gas carrier**, **chemical tanker** and **FLS tanker**.

The requirements for the assignment of this notation are given in Pt B, Ch 12, Sec 4, [3].

## **7 Other notations**

### **7.1**

**7.1.1** The Society may also define other notations by means of provisional requirements and guidelines, which may then be published in the form of tentative rules.

## 8 Diving systems

### 8.1 General

**8.1.1** The service notations related to diving systems are listed in [8.1.2]. The requirements for the assignment of these service notations are given in NR610 Rules for the Classification of Diving Systems.

**8.1.2** The following service notations are to be assigned to the diving systems, as relevant:

- **diving system-integrated**, for the diving systems permanently installed on diving support units
- **diving system-portable**, for the diving systems on portable modules and installed temporarily on diving support units
- **hyperbaric reception facility**, when a decompression chamber is used to transfer the occupants of hyperbaric rescue units.

**8.1.3** The service notations **diving system-integrated** and **diving system-portable** are to be completed by one of the following additional service features:

- **surface air**, for diving systems using only compressed air
- **surface mixed-gas**, for diving systems using mixed-gas
- **saturation**, for saturation diving systems
- **bounce**, for bounce systems using a closed bell.

**8.1.4** The requirements for the maintenance of these notations are given in Ch 4, Sec 8, [18].

# Appendix 1 Notations Assigned According to Editions of the Rules Former to June 2000 Edition

## 1 Application for surveys and correspondence with current notations

### 1.1 General

**1.1.1** The current edition of the Rules uses a different system of class notations, in comparison with the one in force in the editions of the Rules former to June 2000 edition.

Subarticle [1.4] gives correspondence between the notations assigned to ships according to the editions of the Rules former to June 2000 edition and the class notations assigned according to the current edition.

### 1.2 Phasing out from former to current notations

**1.2.1** All ships admitted or being admitted to class after the effective application date of the current Rules are to be assigned class notations in accordance with Ch 1, Sec 2.

**1.2.2** Ships with notations assigned in accordance with editions of the Rules former to the June 2000 edition of the Rules keep their current notations, latest until next class renewal survey.

At the class renewal survey, notations having an equivalence with the notations given in the current edition, are replaced by the corresponding notation according to tables of subarticle [1.4].

Notations indicated as having no equivalence with any notation in the current Rules are kept for the life time of the ship.

Note 1: At Owner's request, change over from former to current notations may be performed before the next class renewal survey.

### 1.3 Application of scope of surveys

**1.3.1** For periodicity and scope of surveys for maintenance of class of ships being still assigned class notations according to editions of the Rules former to June 2000 edition, tables given in [1.4] indicate which requirements are applicable to such notations, with reference to class notations of the current Rules.

### 1.4 Correspondence between former and current notations

**1.4.1** Tab 1 gives correspondence between former class symbols and construction marks and the current ones.

**1.4.2** Tab 2 gives correspondence between former service notations and the current ones, as well as corresponding periodicity and scope of survey for maintenance of class.

Tab 3 gives correspondence between former additional service notations and the current additional service feature.

**1.4.3** Tab 4 gives correspondence between former navigation notations or operating area notations and the current ones.

**1.4.4** Tab 5 gives correspondence between former additional class notations or special notations and the current ones, as well as corresponding survey requirements for maintenance of class.

**Table 1 : Class symbols and construction marks**

Former notation	Current notation	Remarks
I 3/3	class symbol <b>I</b>	Validity of certificate ≤ 5 years
II 5/6, II 3/3 or I 5/6	class symbol <b>II</b>	Validity of certificate ≤ 3 years
E, (E) or (–)	None. A note is entered in a memorandum for notations (E) or (–)	Surveys of anchors and chains dealt with in Part A, Chapter 3
⊠, ⊠ or • placed before the service notation	⊠, ⊠ or • <b>HULL</b>	(1)
⊠, ⊠ or • MACH	⊠, ⊠ or • <b>MACH</b>	(1)
(1) No specific periodicity or scope of survey attached to such notation.		

Table 2 : Service notations

Former notation	Current notation	Periodicity and scope of surveys
bulk carrier	<b>bulk carrier</b>	bulk carrier ESP or general cargo ship, as applicable
bulk carrier - oil tanker	<b>combination carrier/OBO</b>	combination carrier/OBO
cargoship	<b>general cargo ship</b>	general cargo ship
chemical tanker	<b>chemical tanker</b>	chemical tanker
containership	<b>container ship</b>	container ship
deck ship	<b>deck ship</b>	all ships
dredger	<b>dredger</b>	dredger
fire fighting ship 1, 2, 3, - or water spray	<b>fire fighting 1, 2, 3, E or water spraying</b>	fire fighting ship 1, 2, 3, E or water spraying
fishing vessel	<b>fishing vessel</b>	fishing vessel
floating dock	<b>floating dock</b>	floating dock
hopper barge	<b>hopper unit</b>	hopper unit
hopper dredger	<b>hopper dredger</b>	hopper dredger

## Classification and Surveys

---

### CHAPTER 2

## ASSIGNMENT, MAINTENANCE, SUSPENSION AND WITHDRAWAL OF CLASS

---

Section 1	Assignment of Class
Section 2	Maintenance of Class
Section 3	Suspension and Withdrawal of Class
Appendix 1	Planned Maintenance Survey System
Appendix 2	CSM and PMS Systems: Surveys Carried out by the Chief Engineer
Appendix 3	Thickness Measurements: Extent, Determination of Locations, Acceptance Criteria
Appendix 4	Condition Monitoring and Condition Based Maintenance
Appendix 5	Remote Classification Surveys

# Section 1 Assignment of Class

## 1 General

### 1.1

**1.1.1** Class is assigned to a ship upon a survey, with the associated operations, which is held in order to verify whether it is eligible to be classed on the basis of the Rules of the Society (see Ch 1, Sec 1, [1.3.2]). This may be achieved through:

- the completion of the new building, during which a survey has been performed
- a survey carried out according to the agreement developed by the IACS Member Societies when ships change class between members, or
- a specific admission to class survey, in cases where a ship is classed with a non-IACS Society or is not classed at all.

## 2 New building procedure

### 2.1 Ships surveyed by the Society during construction

**2.1.1** When a ship is surveyed by the Society during construction, it is to comply with those requirements of the Rules which are in force and applicable depending on the class of the ship, taking into account the provisions of Ch 1, Sec 1, [2.1] and Ch 1, Sec 1, [2.2].

The hull surveys for new constructions are to be carried out in accordance with the requirements of Ch 3, Sec 7.

**2.1.2** The Society:

- approves the plans and documentation submitted as required by the Rules
- proceeds, if required, with the appraisal of the design of materials and equipment used in the construction of the ship and their inspection at works
- carries out surveys, attends tests and trials provided for in the Rules, or obtains appropriate evidence to satisfy itself that the scantlings and construction meet the rule requirements in relation to the approved drawings
- assigns the construction mark  $\boxtimes$ ; refer to Ch 1, Sec 2, [3.2.1].

**2.1.3** The Society defines in specific Rules which materials and equipment used for the construction of ships built under survey are, as a rule, subject to appraisal of their design and to inspection at works, and according to which particulars.

**2.1.4** As part of his interventions during the ship's construction and subject to the provisions of [2.1.2], the Surveyor will:

- conduct an overall examination of the parts of the ship covered by the Rules
- examine the construction methods and procedures when required by the Rules
- check selected items covered by the rule requirements
- attend tests and trials where applicable and deemed necessary.

#### 2.1.5 Use of materials, machinery, appliances and items

As a general rule, all materials, machinery, boilers, auxiliary installations, equipment, items etc. (generally referred to as "products") which are covered by the class and used or fitted on board ships surveyed by the Society during construction are to be new and, where intended for essential services as defined in Ch 1, Sec 1, [1.2.1], tested by the Society.

Second hand materials, machinery, appliances and items may be used subject to the specific agreement of the Society and the Owner.

The requirements for the selection of materials to be used in the construction of the various parts of a ship, the characteristics of products to be used for such parts and the checks required for their acceptance are to be as stated in Part C of the Rules (NR467) and in NR216 Materials and Welding, as applicable, or in other Parts of NR467, or as specified on approved plans. In particular, the testing of products manufactured according to quality assurance procedures approved by the Society and the approval of such procedures are governed by the requirements of NR216 Materials and Welding, Ch 1, Sec 1, [3].

Attention is drawn to the provisions of the EC Regulation 391/2009, specifically Article 10.

#### 2.1.6 Defects or deficiencies and their repair

The Society may, at any time, reject items found to be defective or contrary to rule requirements or require supplementary inspections and tests and/or modifications, notwithstanding any previous certificates issued.

All repairs are subject to the preliminary agreement of the Society. When the limits of tolerance for defects are specified in the Rules concerned or by the Manufacturer, they are to be taken into account for repairs.

It is incumbent upon the Interested Party to notify the Society of any defects noted during the construction of the ship and/or of any item not complying with the applicable requirements or in any case unsatisfactory. Proposals regarding remedial actions intended to be adopted to eliminate such defects or unsatisfactory items are to be submitted to the Society and, if accepted, carried out to the Surveyor's satisfaction.

### 2.1.7 Equivalence of Rule testing under certain conditions

Notwithstanding the provisions of [2.1.4], the Society may, at its discretion and subject to conditions and checks deemed appropriate, accept certain materials, appliances or machinery which have not been subjected to rule testing.

## 2.2 Other cases

**2.2.1** When the procedure adopted does not comply with that detailed in [2.1] but the Society deems that it is acceptable for the assignment of class, the construction mark  $\mu$  is assigned in accordance with Ch 1, Sec 2, [3.2.3].

## 2.3 Documentation

**2.3.1** Documentation relevant to the class applied for is to be submitted for the approval of the Society.

**2.3.2** The documentation to be submitted is listed in the relevant chapters of the Rules.

The lists of requested plans, documents and other items related to classification are not exhaustive and are intended as guidance for specifying the set of information to be submitted, rather than lists of actual titles. The Society may require that additional information be submitted if deemed necessary for the verification of rule requirements, especially in the case of non-conventional design.

**2.3.3** The documentation submitted to the Society is examined in relation to the class applied for in the request for classification.

Note 1: Should the Interested Party subsequently wish to have the class, in particular the service notation or navigation notation, granted to the ship modified, plans and drawings are generally to be re-examined.

**2.3.4** A copy of the submitted plans will be returned duly stamped, with remarks related to the compliance with the rule requirements should the need arise.

**2.3.5** As a rule, modifications of the approved plans regarding items covered by classification are to be submitted.

**2.3.6** Design data to be submitted to the Society are to incorporate all information necessary for the assessment of the design of the ship for the purpose of assignment of class. It is the responsibility of the Interested Party to ascertain that the design data are correct, complete and compatible with the use of the ship.

**2.3.7** Design calculations are to be provided, when called for, as supporting documents to the submitted plans.

**2.3.8** Design data and calculations are to be adequately referenced. It is the duty of the Interested Party to ascertain that the references used are correct, complete and applicable to the design of the ship.

**2.3.9** The submitted plans are to contain all necessary information for checking the compliance with the requirements of the Rules.

**2.3.10** In the case of conflicting information, submitted documentation will be considered in the following order of precedence: design data, plans, design calculations.

**2.3.11** It is the responsibility of the Interested Party to ascertain that drawings used for the procurement, construction and other works are in accordance with the approved plans.

**2.3.12** Upon specific agreement between the Society and the Interested Parties, three-dimensional models may be submitted in place of two-dimensional plans. In this case, the Society may require that additional documentation containing information that cannot be specified in three-dimensional models be submitted.

## 3 Ships classed after construction

### 3.1 General

**3.1.1** When an Owner applies to the Society for a ship already in service to be admitted to class, the application will be processed differently depending on whether the ship is:

- classed with an IACS Society, or
- not classed with an IACS Society.

### 3.2 Ships classed with a Classification Society subject to compliance with QSCS, reported as compliant by the Losing Society

**3.2.1** In this case, ships will be admitted to the Society's class upon satisfactory surveys and verification of documentation. For the extent and scope of the surveys to be carried out and the list of documentation to be submitted by the Interested Party, reference is to be made to [3.2.3], [3.2.4] and [3.2.5].

Note 1: For transfer of class at ship's delivery, specific procedures apply.

Note 2: Compliant ship means a ship classed with a Classification Society subject to verification of compliance with QSCS and in full compliance with all applicable and relevant IACS Resolutions.

#### 3.2.2 Surveys principle

Surveys to be carried out are based on the age of the ship and the updated current class status as provided by the previous IACS Member Society. The extent of these surveys is to be at least as contained in [3.2.3] and in [3.2.4].

#### 3.2.3 Hull surveys

- a) For vessels of age less than 5 years, the survey is to take the form of an annual survey
- b) For vessels between 5 and 10 years of age, in addition, the survey is to include the inspection of a representative number of ballast spaces
- c) For vessels of 10 years of age and above but less than 20 years of age, in addition, the survey is to include the inspection of a representative number of cargo spaces, except for:
  - For gas carriers, in lieu of internal inspection of cargo spaces, the following applies:
    - inspection of surrounding ballast tank(s), including external inspection of independent cargo tank(s) and supporting systems as far as possible
    - review of cargo log books and operational records to verify correct functioning of the cargo containment system.
  - For chemical tankers of 10 years and above but less than 15 years of age, in lieu of an internal inspection of cargo tanks without internal stiffening and framing, inspections of surrounding ballast tank(s) and void spaces and deck structure, are to be applied.
- d) For vessels with notation **ESP**, which are 15 years of age and above, but less than 20 years of age, the survey is to have the scope of a class renewal survey or an intermediate survey, whichever is due next
- e) For all vessels which are 20 years of age and above, the survey is to have the scope of a class renewal survey (this requirement is also applicable to ships having their hull under continuous survey)
- f) In lieu of the requirements in items a) through e) above, the following apply for site specific purpose-built Floating Production and/or Storage Vessels:
  - for vessels of age less than 5 years, the survey is to have the scope of an annual survey
  - for vessels of age between 5 and 10 years, in addition, the survey is to include the inspection of twenty percent of ballast spaces
  - for vessels of age between 10 and 20 years, in addition, the survey is to include twenty percent of cargo spaces
  - for vessels over 20 years of age, the survey is to have the scope of a class renewal survey.
- g) For site specific Floating Production and/or Storage Vessels which have been converted from other vessels, the survey is to take form of an annual survey and also include inspection of twenty percent of ballast spaces and twenty percent of cargo spaces until 20 years have elapsed since conversion. After 20 years the survey is to have the scope of a class renewal survey.
- h) In the context of applying items d) and e) above, if a dry-docking of the vessel is not due at time of transfer, consideration can be given to carrying out an underwater examination in lieu of dry-docking
- i) In the context of applying items d) and e) above, as applicable, the anchors and anchor chain cables ranging and gauging for vessels over 15 years of age is not required to be carried out as part of the class entry survey unless the class entry survey is being credited as a periodical survey for maintenance of class. If the class entry survey is to be credited as a periodical survey of maintenance of class, consideration may be given by the gaining society to the acceptance of the anchors and anchor chain cables ranging and gauging carried out by the losing society provided they were carried out within the applicable survey window of the periodical survey in question
- j) In the context of applying items a) to h) above, as applicable:
  - if the class entry survey is to be credited as a periodical survey for maintenance of class, consideration may be given by the gaining society to the acceptance of thickness measurements taken by the losing society provided they were carried out within the applicable survey window of the periodical survey in question.
  - if the class entry survey is not to be credited as a periodical survey for maintenance of class, consideration may be given by the gaining society to the acceptance of thickness measurements taken by the losing society provided they were carried out within 15 months prior to completion of class entry survey when it is in the scope of a class renewal survey, within 18 months prior to the completion of class entry survey when it is in the scope of an intermediate survey.

In both cases, the thickness measurements are to be reviewed by the gaining society for compliance with the applicable survey requirements, and confirmatory gauging are to be taken to the satisfaction of the gaining society.

- k) In the context of applying c) to h) above, as applicable, tank testing for vessels over 15 years of age is not required to be carried out as part of class entry survey unless the class entry survey is being credited as a periodical survey for the maintenance of class. If the class entry survey is to be credited as a periodical survey for maintenance of class, consideration may be given by the gaining society provided they were carried out within the applicable survey window of the periodical survey in question.
- l) In the context of applying a) to h) above, as applicable, compliance with IACS Unified Requirements that require compliance at the forthcoming due periodical survey (such as UR S26 and S27) are not required to be carried out /completed as part of the class entry survey unless the class entry survey is credited as a periodical survey for maintenance of class.

### **3.2.4 Machinery surveys**

A general examination of all essential machinery is to be held including at least the following:

- a) Examination under working condition of oil fuel burning equipment, boilers, economizers and steam/steam generators. The adjustment of safety valves of this equipment is to be verified by checking the records on board ship
- b) All pressure vessels are to be examined
- c) Insulation resistance, generator circuit breakers, preference tripping relays and generator prime mover governors are to be tested and paralleling and load sharing to be proved
- d) In all cases, navigating lights and indicators are to be examined and their working and alternative sources of power verified
- e) Bilge pumps, emergency fire pumps and remote controls for oil valves, oil fuel pumps, lubricating oil pumps and forced draught fans are to be examined under working condition
- f) Recirculating and ice clearing arrangements, if any
- g) The main and all auxiliary machinery necessary for operation of the ship at sea together with essential controls and steering gear is to be tested under working conditions. Alternative means of steering are to be tested
- h) A short sea trial is to be held, at the Surveyor's discretion, if the ship has been laid up for a long period
- i) Initial start arrangements are to be verified
- j) In the case of oil tankers, the cargo oil system and electrical installations in way of hazardous spaces are to be checked for compliance with rule requirements. Where intrinsically safe equipment is installed, the Surveyors are to satisfy themselves that such equipment has been approved by a recognised authority. The safety devices, alarms and essential instruments of the inert gas system are to be verified and the plant generally examined to ensure that it does not constitute a hazard to the ship.

Note 1: For the transfer of class or adding class at ship's delivery, items c) and j) may be verified by reviewing the ship's record.

### **3.2.5 Documentation**

As a rule, the documentation to be supplied is the following.

- a) Main plans:
- General arrangement
  - Capacity plan
  - Hydrostatic curves
  - Loading manual, where required
  - Damage stability calculation, where required.
- b) Hull structure plans:
- Midship section
  - Scantling plan
  - Decks
  - Shell expansion
  - Transverse bulkheads
  - Rudder and rudder stock
  - Hatch covers
  - For ship assigned with the additional service feature **CSR**, plans showing, for each structural element, both as-built and renewal thicknesses and any thickness for "voluntary addition".

- c) Machinery plans:
- Machinery arrangement
  - Intermediate, thrust and screw shafts
  - Propeller
  - Main engines, propulsion gears and clutch systems (or Manufacturer's make, model and rating information)
  - For steam turbine ships, main boilers, superheaters and economisers (or Manufacturer's make, model and rating information) and steam piping
  - Bilge and ballast piping diagram
  - Wiring diagram
  - Steering gear system piping and arrangements and steering gear Manufacturer's make and model information
  - Torsion vibration calculations, for ships less than two years old
  - Plans for flexible couplings and/or torque limiting shafting devices in the propulsion line shafting (or Manufacturer's make, model and rating information), for ships assigned with one of the ice class additional class notations described in Ch 1, Sec 2, [6.10.1]
  - Pumping arrangements at the forward and after ends, drainage of cofferdams and pump rooms and general arrangements of cargo piping in tanks and on decks, for oil tankers.
- d) Plans required for ships assigned one of the additional class notations for Automated Machinery Systems:
- Instrument list
  - Fire alarm system
  - Plans for systematic maintenance and functioning tests.
- e) Additional documents required for approval of alternative design and arrangements.
- f) Document(s) of approval of alternative design and arrangements are to be submitted, if any.
- g) Structural fire protection and fire control plan.

Alternative technical data may be accepted by the Society in lieu of specific items of the listed documentation not available at the time of the transfer of class.

**3.2.6** For ships of less than 100 gross tonnage, special consideration will be given to the scope of surveys and documentation to be supplied.

### **3.3 Non-compliant ships**

**3.3.1** In this case, the class of the ship will be assigned upon a preliminary review of the documentation listed in [3.3.3] and subsequent satisfactory completion of the surveys, the extent and scope of which are given below.

Note 1: Non-compliant ship means a ship either not classed with a Classification Society subject to verification of compliance with QSCS or not in full compliance with all applicable and relevant IACS Resolutions.

#### **3.3.2 Surveys**

The extent and scope of the admission to class survey are to be not less than those required at the class renewal survey of a ship of the same age and type; in addition all other periodical surveys should be performed together with those inspections which are linked to specific service notations and/or additional class notations and/or special installations the ship is provided with.

#### **3.3.3 Documentation**

As a general rule, the documentation to be supplied to the Society is not to be less than the following.

- a) Main plans:
- General arrangement
  - Capacity plan
  - Loading cases, calculations of still water bending moments, and relevant documents, particulars of loading calculator and instruction booklet as per Society's requirements, according to the case
  - Stability documents, if applicable (refer to Part B, Chapter 3).
- b) Hull structure plans:
- Midship section
  - Profile and deck plan
  - Watertight bulkheads
  - Rudder and rudder stock
  - Shell expansion
  - Hatch covers
  - Stern frame.

c) Machinery plans:

- Engine room general arrangement
- Diagram of fuel- (transfer, service), bilge-, ballast-, lubricating oil-, cooling-, steam- and feed-, general service and starting compressed air piping
- Diagram of fire-fighting systems
- Drawings of boilers and air receivers
- Drawings of shaft line, reduction gear and propeller
- Drawings of steering gear
- Torsion vibration calculations as per conditions laid down in Pt C, Ch 1, Sec 9. Such documents are required only for ships less than 2 years old or for older ships the propelling system of which has been modified during the two years preceding the classification.

d) Electrical installation plans:

- Master plan of power distribution, lighting and emergency power circuits
- Single line diagram of networks and switchboards
- Location and arrangement of electrical equipment in hazardous areas.

e) Structural fire protection and fire control plan.

Alternative technical data may be accepted by the Society in lieu of specific items of the listed documentation not available at the time of the transfer of class.

**3.3.4** Where appropriate within reasonable limits, a proven service record of satisfactory performance during a period of adequate length may be used as a criterion of equivalence. Special consideration will be given to ships of recent construction.

**3.3.5** For installations or equipment covered by additional service and/or class notations, the Society will determine the documentation to be submitted.

**3.3.6** In addition, the Society may base its judgement upon documentation such as certificates issued or accepted by the former Classification Society, if any, and statutory certificates issued by the flag Administration or by a recognised organisation on its behalf; moreover, other documents and/or plans may be specifically required to be supplied to the Society in individual cases.

## **4 Date of initial classification**

### **4.1 Definitions**

#### **4.1.1 Date of build**

For a new building the date of build is the year and month at which the new construction survey process is completed. Where there is a substantial delay between the completion of the construction survey process and the ship commencing active service, the date of commissioning may be also specified.

If modifications are carried out, the date of build remains assigned to the ship. Where a complete replacement or addition of a major portion of the ship is involved, the following applies:

- the date of build associated with each major portion of the ship is to be indicated on the Classification Certificate and in the Register, where it has been agreed that the newer structure shall be on a different survey cycle
- survey requirements are to be based on the date of build associated with each major portion of the ship
- survey due dates may be aligned at the discretion of the Society.

Note 1: For example, a major portion of the ship may include a complete forward or after section, a complete main cargo section (which may include a complete hold / tank of a cargo ship), a complete block of deck structure of a passenger ship or a structural modification of a single hull to a double hull ship.

#### **4.1.2 Date of initial classification for new buildings**

As a general rule, for new buildings the date of initial classification coincides with the date of build.

#### **4.1.3 Date of initial classification for existing ships**

In principle, for existing ships the date of initial classification is the date of completion of the admission to class survey.

## **5 Reassignment of class**

### **5.1**

**5.1.1** At the request of the Owner, a ship which was previously classed with the Society, subsequently withdrawn from class and has not been classed since may have the class reassigned subject to an admission to class survey. If applicable and appropriate, account may be taken of any periodical surveys held in the former period of class with the Society.

## Section 2 Maintenance of Class

### 1 General principles of surveys

#### 1.1 Survey types

**1.1.1** Classed ships are submitted to surveys for the maintenance of class. These surveys include the class renewal survey, intermediate and annual survey, bottom survey (either survey in dry condition or in-water survey), tailshaft survey, boiler survey, and surveys for the maintenance of additional class notations, where applicable. Such surveys are carried out at the intervals and under the conditions laid down in this Section. In addition to the above periodical surveys, ships are to be submitted to occasional surveys whenever the circumstances so require; refer to [6], also when the Owner requires a specific survey in case of sales; refer to Article [7].

**1.1.2** The different types of periodical surveys are summarised in Tab 1. The intervals at which the periodical surveys are carried out are given in the items referred to in the second column of Tab 1. The relevant extent and scope are given in Part A, Chapter 3 and Part A, Chapter 4 for all ships and for service notations, respectively, while surveys related to additional class notations are given in Part A, Chapter 5.

Where there are no specific survey requirements for additional class notations assigned to a ship, equipment and/or arrangements related to these additional class notations are to be examined, as applicable, to the Surveyor's satisfaction at each class renewal survey for the class.

The surveys are to be carried out in accordance with the relevant requirements in order to confirm that the hull, machinery, equipment and appliances comply with the applicable Rules and will remain in satisfactory condition based on the understanding and assumptions mentioned in Ch 1, Sec 1, [3.3].

Where the conditions for the maintenance of the class, service notations and additional class notations are not complied with, the class and/or the service notation and/or the additional class notations as appropriate will be suspended and/or withdrawn in accordance with the applicable Rules given in Ch 2, Sec 3.

Note 1: It is understood that requirements for surveys apply to those items that are required according to the Rules or, even if not required, are fitted on board.

**1.1.3** Unless specified otherwise, any survey other than bottom survey and tailshaft survey may be effected by carrying out partial surveys at different times to be agreed upon with the Society, provided that each partial survey is adequately extensive. The splitting of a survey into partial surveys is to be such as not to impair its effectiveness.

**1.1.4** Special consideration may be given in application of Ch 3, Sec 1 to Ch 3, Sec 6 to commercial ships owned or chartered by Administrations, which are utilized in support of military operations or service.

**Table 1 : List of periodical surveys**

Type of survey	Reference in this Section	Reference to scope of survey
Class renewal - hull	[4]	Ch 3, Sec 3 and Part A, Chapter 4 <b>(1)</b>
Class renewal - machinery	[4]	Ch 3, Sec 3 and Part A, Chapter 4 <b>(1)</b>
Class renewal - additional class notations	[1.1]	Part A, Chapter 5 <b>(2)</b>
Annual - hull	[5.2]	Ch 3, Sec 1 and Part A, Chapter 4 <b>(1)</b>
Annual - machinery	[5.2]	Ch 3, Sec 1 and Part A, Chapter 4 <b>(1)</b>
Annual - additional class notations	[1.1]	Part A, Chapter 5 <b>(2)</b>
Intermediate - hull	[5.3]	Ch 3, Sec 2 and Part A, Chapter 4 <b>(1)</b>
Intermediate - machinery	[5.3]	Ch 3, Sec 2 and Part A, Chapter 4 <b>(1)</b>
Bottom - dry condition	[5.4]	Ch 3, Sec 4
Bottom - in water	[5.4]	Ch 3, Sec 4
Tailshaft - complete	[5.5]	Ch 3, Sec 5
Tailshaft - modified	[5.5]	Ch 3, Sec 5
Boiler - complete	[5.6]	Ch 3, Sec 6
<b>(1)</b> As applicable, according to the service notation assigned to the ship.		
<b>(2)</b> As applicable, according to the additional class notations assigned to the ship.		

## **1.2 Change of periodicity, postponement or advance of surveys**

**1.2.1** The Society reserves the right, after due consideration, to change the periodicity, postpone or advance surveys, taking into account particular circumstances.

**1.2.2** When a survey becomes overdue during a voyage, the following applies:

- a) In the case of a class renewal survey, the Society may grant an extension to allow for completion of the class renewal survey, provided there is documented agreement to such an extension prior to the expiry date of the Certificate of Classification, adequate arrangements have been made for attendance of the Surveyor at the first port of call and the Society is satisfied that there is technical justification for such an extension. Such an extension will be granted only until arrival at the first port of call after the expiry date of the Certificate of Classification.

However, if owing to “exceptional circumstances” as defined in [2.1.8], the class renewal survey cannot be completed at the first port of call, the Society may grant an extension according to [4.1.1], but the total period of extension shall in no case be longer than three months after the original limit date of the class renewal survey.

- b) In the case of annual and intermediate surveys, no postponement is granted. Such surveys are to be completed within their prescribed windows; see [2.1.3].
- c) In the case of all other periodical surveys and conditions of class, extension of class may be granted until the arrival of the ship at the port of destination.

## **1.3 Extension of scope of survey**

**1.3.1** The Society and/or its Surveyors may extend the scope of the provisions in Part A, Chapter 3 to Part A, Chapter 5, which set forth the technical requirements for surveys, whenever and so far as considered necessary, or modify them in the case of special ships or systems.

**1.3.2** The extent of any survey also depends upon the condition of the ship and its equipment. Should the Surveyor have any doubt as to the maintenance or condition of the ship or its equipment, or be advised of any deficiency or damage which may affect the class, then further examination and testing may be conducted as considered necessary.

## **1.4 General procedure of survey**

**1.4.1** The general procedure of survey consists in:

- an overall examination of the parts of the ship covered by the rule requirements
- checking selected items covered by the rule requirements
- attending tests and trials where applicable and deemed necessary by the Surveyor.

**1.4.2** When a survey results in the identification of significant corrosion, structural defects or damage to hull, machinery and/or any piece of its equipment which, in the opinion of the Surveyor, affect the ship’s class, remedial measures are to be implemented before the ship continues in service (see also [2.11]).

Note 1: The Society's survey requirements cannot be considered as a substitute for specification and acceptance of repairs and maintenance, which remain the responsibility of the Owner.

Note 2: In accordance with the provisions of Ch 1, Sec 1, [4.1.3], the Society will, at the request of the Owner, apply the regulations of Administrations concerning the scope and periodicity of surveys when they differ from those laid down in [4] and [5].

Note 3: During the surveys, the Surveyor does not check that the spare parts are kept on board, maintained in working order and suitably protected and lashed.

## **1.5 Appointment of another Surveyor**

**1.5.1** In compliance with the provisions of Ch 1, Sec 1, [2.4.1], should a disagreement arise between the Owner and the Surveyor during a survey, the Society may, at the request of the Owner, designate another Surveyor.

## **1.6 Alterations or additions to approved systems**

**1.6.1** When an alteration or addition to an approved system is proposed, documentation is to be submitted and approved by the Society before the work on the alteration or addition is commenced.

**1.6.2** Where the modifications may affect compliance with the Rules, they are to be carried out under survey and the installation and testing are to be to the Surveyor’s satisfaction.

## 2 Definitions and procedures related to surveys

### 2.1 General

#### 2.1.1 Period of class

Period of class means the period starting either from the date of the initial classification, see Ch 2, Sec 1, [4], or from the credited date of the last class renewal survey, and expiring at the limit date assigned for the next class renewal survey.

#### 2.1.2 Anniversary date

Anniversary date means the day of the month of each year in the period of class which corresponds to the expiry date of the period of class.

#### 2.1.3 Survey time window

Survey time window, or more simply window, mean the fixed period during which annual and intermediate surveys are to be carried out.

#### 2.1.4 Overdue surveys

Each periodical survey is assigned a limit date specified by the relevant requirements of the Rules (end of survey interval or end date of window) by which it is to be completed.

A survey becomes overdue when it has not been completed by its limit date.

Examples:

- Anniversary date: 15<sup>th</sup> April  
The 2000 annual survey can be validly carried out from 16<sup>th</sup> January 2000 to 15<sup>th</sup> July 2000. If not completed by 15<sup>th</sup> July 2000, the annual survey becomes overdue.
- Last bottom survey 20<sup>th</sup> October 2000:  
If not completed by 20<sup>th</sup> October 2003 or end of the class period, whichever comes first, the bottom survey becomes overdue.

#### 2.1.5 Condition of class

A defect and/or deficiency to be dealt with in order to maintain class, within a specific period of time, is indicated as a condition of class. A condition of class is pending until it is cleared, through a survey by the attending Surveyor or upon evidence that requirements have been completed, to the satisfaction of the Society. Where it is not cleared by its limit date, the condition of class is overdue.

Condition of class may be imposed in other cases, which, in the Society's opinion, require specific consideration.

#### 2.1.6 Classification memoranda

Those defects and/or deficiencies which do not affect the maintenance of class and which may therefore be cleared at the Owner's convenience and any other information deemed noteworthy for the Society's convenience are indicated as classification memoranda. Classification memoranda are not to be regarded as condition of class.

#### 2.1.7 Statutory memoranda

Those defects and/or deficiencies which do not affect the statutory certification and which may therefore be cleared at the Owner's convenience and any other information noteworthy for the Society's convenience are indicated as statutory memoranda.

Statutory memoranda are not to be regarded as statutory recommendations

#### 2.1.8 Exceptional circumstances

"Exceptional circumstances" means:

- unavailability of dry-docking facilities, or
- unavailability of repair facilities, or
- unavailability of essential materials, equipment or spare parts, or
- delays incurred by action taken to avoid severe weather conditions.

## 2.2 Terminology related to hull survey

### 2.2.1 Ballast tank

A ballast tank is a tank that is being used primarily for salt water ballast.

For single skin and double skin bulk carriers subject to the requirements of Ch 4, Sec 2, a ballast tank is a tank which is used solely for salt water ballast, or, where applicable, a space which is used for both cargo and salt water ballast will be treated as a ballast tank when substantial corrosion has been found in that space, see [2.2.7]. For double skin bulk carriers, a double side tank is to be considered as a separate tank even if it is in connection to either the topside tank or the hopper side tank.

For oil tankers subject to the requirements of Ch 4, Sec 3 and chemical tankers subject to the requirements of Ch 4, Sec 4, a ballast tank is a tank which is used solely for the carriage of salt water ballast. A combined cargo/ballast tank is a tank which is used for the carriage of cargo or ballast water as a routine part of the vessel's operation and will be treated as a ballast tank. Cargo tanks in which water ballast might be carried only in exceptional cases per MARPOL I/18(3) are to be treated as cargo tanks.

### **2.2.2 Spaces**

Spaces are separate compartments including holds and tanks.

For ships subject to Ch 4, Sec 2, spaces are separate compartments including holds, tanks, cofferdams and void spaces bounding cargo holds, decks and the outer hull.

### **2.2.3 Overall survey**

An overall survey is a survey intended to report on the overall condition of the hull structure and determine the extent of additional close-up surveys.

### **2.2.4 Close-up survey**

A close-up survey is a survey where the details of structural components are within the close visual inspection range of the Surveyor, i.e. normally within reach of hand.

### **2.2.5 Transverse section**

A transverse section includes all longitudinal members contributing to longitudinal hull girder strength, such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom, longitudinal bulkheads and, as applicable for the different ship types, relevant longitudinals, hopper sides, bottom in top wing tanks, inner sides. For a transversely framed ship, a transverse section includes adjacent frames and their end connections in way of transverse sections.

### **2.2.6 Representative tanks or spaces**

Representative tanks or spaces are those which are expected to reflect the condition of other tanks or spaces of similar type and service and with similar corrosion prevention systems. When selecting representative tanks or spaces, account is to be taken of the service and repair history on board and identifiable critical structural areas and/or suspect areas.

### **2.2.7 Substantial corrosion**

Substantial corrosion is an extent of corrosion such that assessment of the corrosion pattern indicates a wastage in excess of 75% of allowable margins, but within the acceptable limits.

For the following ships:

- ships assigned the service notation **liquefied gas carrier** contracted for construction on or after 1st July 2022,
- oil tankers built under Common Structural Rules for Double Hull Oil Tankers (NR523),
- bulk carriers built under Common Structural Rules for Bulk Carriers (NR522),
- bulk carriers or oil tankers built under Common Structural Rules for Bulk Carriers and Oil Tankers (NR606),
- cargo ships, other than container ships, with a length greater than 65m and contracted for construction on or after 1st July 2022,
- container ships with a length greater than 65 m and contracted for construction on or after 1st July 2016,
- ships having alternate light or heavy cargo loading conditions, irrespective of their length and contracted for construction on or after 1st July 2022,
- non-cargo ships with a length greater than 90 m and contracted for construction on or after 1st July 2022,

substantial corrosion is an extent of corrosion such that the assessment of the corrosion pattern indicates a measured thickness between ( $t_{\text{renewal}} + 0,5 \text{ mm}$ ) and  $t_{\text{renewal}}$ .

Note 1:  $t_{\text{renewal}}$  is the minimum allowable thickness, in mm, below which renewal of structural members is to be carried out.

Note 2: For the definition of cargo ships and non-cargo ships, reference is to be made to NR600, Ch 1, Sec 1.

### **2.2.8 Pitting corrosion**

Pitting corrosion is defined as scattered corrosion spots/ areas with local material reductions which are greater than the general corrosion in the surrounding area. Pitting intensity is defined in Ch 2, App 3, Fig 22.

### **2.2.9 Edge corrosion**

Edge corrosion is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings, as shown in Ch 2, App 3, Fig 15.

### **2.2.10 Grooving corrosion**

Grooving corrosion is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffeners or plate butts or seams, as shown in Ch 2, App 3, Fig 16.

### **2.2.11 Suspect areas**

Suspect areas are locations showing substantial corrosion and/or considered by the Surveyor to be prone to rapid wastage.

### **2.2.12 Critical structural areas**

Critical structural areas are locations which have been identified from calculations to require monitoring or from the service history of the subject ship or from similar ships or sister ships (if available), to be sensitive to cracking, buckling or corrosion which would impair the structural integrity of the ship.

### **2.2.13 Corrosion prevention system**

A corrosion prevention system is normally considered a full hard protective coating.

Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems, which are neither soft nor semi-hard coatings, may be considered acceptable as alternatives, provided that they are applied and maintained in compliance with the Manufacturer's specifications.

### **2.2.14 Coating condition**

Coating condition is defined as follows:

- good: condition with only minor spot rusting
- fair: condition with local breakdown at edges of stiffeners and weld connections and/or light rusting over 20% or more of areas under consideration, but less than as defined for poor condition
- poor: condition with general breakdown of coating over 20% or more or hard scale at 10% or more, of areas under consideration.

### **2.2.15 Cargo area (ships carrying liquid cargo in bulk)**

The cargo area is that part of the ship which contains cargo tanks, slop tanks and cargo/ballast pump rooms, compressor rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above-mentioned spaces.

### **2.2.16 Cargo length area (dry cargo ships)**

The cargo length area is that part of the ship which includes cargo holds and adjacent areas including fuel tanks, cofferdams, ballast tanks and void spaces.

### **2.2.17 Prompt and thorough repair**

A "Prompt and thorough repair" is a permanent repair completed at the time of survey to the satisfaction of the Surveyor, therein removing the need for the imposition of any associated condition of class. See also [2.11].

### **2.2.18 Special consideration**

Special consideration or specially considered (in connection with close-up surveys and thickness measurements) means sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.

### **2.2.19 Air pipe head**

Air pipe heads installed on the exposed decks are those extending above the freeboard deck or superstructure decks.

### **2.2.20 Remote inspection techniques (RIT)**

Remote inspection techniques is a means of survey that enables examination of any part of the structure without the need for direct physical access of the Surveyor (refer to IACS Recommendation 42, "Guidelines for use of remote inspection techniques for surveys").

### **2.2.21 Remote Survey**

A "Remote Survey" is a process of verifying that a ship and its equipment are in compliance with the Rules where the verification is undertaken, or partially undertaken, without attendance on board by a Surveyor.

## **2.3 Procedures for thickness measurements**

**2.3.1** When required as per the scope of surveys defined below, thickness measurements are normally to be carried out under the responsibility of the Owner, and in the presence of the Surveyor, by a service supplier independent from the Owner.

**2.3.2** For all ships, the following applies:

- thickness measurements required in the context of surveys of hull structure is to be witnessed by a Surveyor. This requires the Surveyor to be on board while the gaugings are taken, enabling him at any time to intervene and to control the process.
- prior to commencement of the intermediate or class renewal survey, a meeting is to be held between the attending Surveyor(s), the master of the ship or an appropriately qualified representative appointed by the master or Company, the Owner's representative(s) in attendance and the thickness measurement firm's representative(s) so as to ensure the safe and efficient execution of the surveys and thickness measurements to be carried out onboard.

**2.3.3** In any kind of survey, i.e. class renewal, intermediate, annual or other surveys having the same scope, thickness measurements of structures in areas where close-up surveys are required, are to be carried out simultaneously with close-up surveys.

**2.3.4** Consideration may be given by the attending Surveyor to allow the use of Remote Inspection Techniques (RIT) as an alternative to close-up survey. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor. When RIT is used for a close-up survey, temporary means of access for the corresponding thickness measurements is to be provided unless such RIT is also able to carry out the required thickness measurements.

Note 1: Use of RIT as an alternative to close-up survey is normally not allowed for ships assigned the service notation **bulk carrier ESP** or **bulk carrier BC-A ESP** or **bulk carrier BC-B ESP** or **bulk carrier BC-C ESP** or **self-unloading bulk carrier ESP** or **ore carrier ESP** or **combination carrier/OBO ESP** or **combination carrier/OOC ESP** or **oil tanker ESP**, unless written agreement of the ship's Flag is obtained.

**2.3.5** For structure built with a material other than steel, alternative thickness measurement requirements may be developed and applied as deemed necessary by the Society.

**2.3.6** Thickness measurement is normally to be carried out by means of ultrasonic test equipment. The accuracy of the equipment is to be proven to the Surveyor as required. The thickness measurements are to be carried out by a company authorised by the Society.

The Society reserves the right to limit the scope of authorisation of the Company.

Note 1: Rule Note NR533 Approval of Service Suppliers gives details about the authorisation.

**2.3.7** A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured and the corresponding original thickness. Furthermore, the report is to include the date when the measurements were carried out, the type of measuring equipment, the names and the qualification of the operators and their signatures.

The Surveyor is to review the final thickness measurement report and countersign the cover page.

**2.3.8** For acceptance criteria applicable to structural corrosion diminution levels, reference is to be made to Ch 2, App 3.

## **2.4 Agreement of firms for in-water survey**

**2.4.1** The in-water surveys referred to in the Rules are to be carried out by a certified company accepted by the Society.

Note 1: Rule Note NR533 Approval of Service Suppliers gives details about the certification.

## **2.5 Preparations and conditions for surveys**

**2.5.1** The Owner is to provide the necessary facilities for the safe execution of the surveys, as per Ch 1, Sec 1, [3.2.2].

**2.5.2** Cargo holds, tanks and spaces are to be safe for access. Cargo holds, tanks and spaces are to be gas free and properly ventilated. Prior to entering a tank, void or enclosed space, it is to be verified that the atmosphere in the tank or space is free from hazardous gas and contains sufficient oxygen.

In preparation for survey and thickness measurements and to allow for a thorough examination, all spaces are to be cleaned including removal from surfaces of all loose accumulated corrosion scale. Spaces are to be sufficiently clean and free from water, scale, dirt, oil residues, etc. to reveal corrosion, deformation, fractures, damages or other structural deterioration as well as the condition of the coating. However, those areas of structure whose renewal has already been decided by the Owner need only be cleaned and descaled to the extent necessary to determine the limits of the areas to be renewed.

Sufficient illumination is to be provided to reveal corrosion, deformation, fractures, damages or other structural deterioration as well as condition of the coating.

Where soft or semi-hard coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft or semi-hard coating is to be removed.

Casings, ceilings or linings, and loose insulation, where fitted, are to be removed, as required by the Surveyor, for examination of plating and framing. Compositions on plating are to be examined and sounded, but need not be disturbed if found adhering satisfactorily to the plating.

In refrigerated cargo spaces the condition of the coating behind the insulation is to be examined at representative locations. The examination may be limited to verification that the protective coating remains effective and that there are no visible structural defects. Where POOR coating condition is found, the examination is to be extended as deemed necessary by the Surveyor. The condition of the coating is to be reported. If indents, scratches, etc., are detected during surveys of shell plating from the outside, insulations in way are to be removed as required by the Surveyor, for further examination of the plating and adjacent frames.

**2.5.3** A communication system is to be arranged between the survey party in the cargo hold, tank or space being examined, the responsible officer on deck and, as the case may be, the navigation bridge. The communication arrangements are to be maintained throughout the survey. This system is also to include the personnel in charge of ballast pump handling if boats or rafts are used.

**2.5.4** Explosimeter, oxygen-meter, breathing apparatus, lifelines, riding belts with rope and hook and whistles together with instructions and guidance on their use are to be made available during the survey. A safety check-list is to be provided.

**2.5.5** Adequate and safe lighting is to be provided for the safe and efficient conduct of the survey.

**2.5.6** Adequate protective clothing is to be made available and used (e.g. safety helmet, gloves, safety shoes, etc.) during the survey.

**2.5.7** Surveys of tanks or applicable holds by means of boats or rafts may only be undertaken with the agreement of the Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response under foreseeable conditions and provided the expected rise of water within the tank does not exceed 0,25m.

**2.5.8** When rafts or boats will be used for close-up survey the following conditions are to be observed:

- a) only rough duty, inflatable rafts or boats, having satisfactory residual buoyancy and stability even if one chamber is ruptured, are to be used
- b) the boat or raft is to be tethered to the access ladder and an additional person is to be stationed down the access ladder with a clear view of the boat or raft
- c) appropriate lifejackets are to be available for all participants
- d) the surface of water in the tank or hold is to be calm (under all foreseeable conditions the expected rise of water within the tank is not to exceed 0,25 m) and the water level stationary. On no account is the level of the water to be rising while the boat or raft is in use
- e) the tank, hold or space must contain clean ballast water only. Even a thin sheen of oil on the water is not acceptable, and
- f) at no time is the water level to be allowed to be within 1 m of the deepest under deck web face flat so that the survey team is not isolated from a direct escape route to the tank hatch. Filling to levels above the deck transverses is only to be contemplated if a deck access manhole is fitted and open in the bay being examined, so that an escape route for the survey party is available at all times. Other effective means of escape to the deck may be considered.
- g) if the tanks (or spaces) are connected by a common venting system, or Inert Gas system, the tank in which the boat or raft is to be used is to be isolated to prevent a transfer of gas from other tanks (or spaces).

**2.5.9** Rafts or boats alone may be allowed for inspection of the under deck areas for tanks or spaces, if the depth of the webs is 1,5 m or less.

If the depth of the webs is more than 1,5 m, rafts or boats alone may be allowed only:

- when the coating of the under deck structure is in GOOD condition and there is no evidence of wastage; or
- if a permanent means of access is provided in each bay to allow safe entry and exit. This means:
  - access direct from the deck via a vertical ladder and a small platform fitted approximately 2 m below the deck in each bay; or
  - access to deck from a longitudinal permanent platform having ladders to deck in each end of the tank. The platform shall, for the full length of the tank, be arranged in level with, or above, the maximum water level needed for rafting of under deck structure. For this purpose, the ullage corresponding to the maximum water level is to be assumed not more than 3 m from the deck plate measured at the midspan of deck transverses and in the middle length of the tank (see Fig 1).

If neither of the above conditions are met, then staging or an other equivalent means is to be provided for the survey of the under deck areas.

The use of rafts or boats as mentioned above does not preclude the use of boats or rafts to move about within a tank during a survey.

**Figure 1 : Platform position and ullage corresponding to the maximum water level for oil tankers and chemical tankers**

**2.5.10** When examination of associated structure is required, the following applies:

- ceilings in holds and floors in the engine room are to be lifted to the necessary extent for examination of the structure
- cement or other protective sheathing is to be removed when there is any doubt as to the condition of the plating underneath or when adherence to plating is not tight
- in the case of solid ballast spaces, the solid ballast is to be partially removed for examination of the condition of the structure in way. Should doubts arise, the Surveyor may require more extensive removal of the solid ballast
- insulation of compartments intended for refrigerated cargoes is to be removed over the necessary extent for examination by the Surveyor of the condition of the structure, unless constructional arrangements make such inspections possible without removing the insulation.

## **2.6 Access to structures**

**2.6.1** For overall survey, means are to be provided to enable the Surveyor to examine the hull structure in a safe and practical way.

**2.6.2** For survey in cargo holds and ballast tanks, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

- permanent staging and passages through structures
- temporary staging and passages through structures
- hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
- boats or rafts
- other equivalent means.

**2.6.3** For surveys conducted by use of a remote inspection technique, one or more of the following means of access, acceptable to the Surveyor, is to be provided:

- unmanned robot arm
- remotely operated vehicles (ROV)
- unmanned aerial vehicles/drones
- other means acceptable to the Society.

Note 1: Use of RIT as an alternative to close-up survey is normally not allowed for ships assigned the service notation **bulk carrier ESP** or **bulk carrier BC-A ESP** or **bulk carrier BC-B ESP** or **bulk carrier BC-C ESP** or **self-unloading bulk carrier ESP** or **ore carrier ESP** or **combination carrier/OBO ESP** or **combination carrier/OOC ESP** or **oil tanker ESP**, unless written agreement of the ship's Flag is obtained.

## **2.7 Equipment for surveys**

**2.7.1** One or more of the following fracture detection procedures may be required if deemed necessary by the Surveyor:

- radiographic equipment
- ultrasonic equipment
- magnetic particle equipment
- dye penetrant.

## **2.8 Rescue and emergency response equipment**

**2.8.1** If breathing apparatus and/or other equipment is used as 'Rescue and emergency response equipment' then it is recommended that the equipment should be suitable for the configuration of the space being surveyed.

## **2.9 Surveys at sea and anchorage**

**2.9.1** Surveys at sea or at anchorage may be accepted provided the Surveyor is given the necessary assistance by the personnel on board. Precautions and procedures for carrying out the survey are to be in accordance with [2.5] to [2.7].

## **2.10 Repairs and maintenance during voyage**

**2.10.1** Where repairs to hull, machinery or other equipment, which affect or may affect the class, are to be carried out by a riding crew during a voyage, they are to be planned in advance. A complete repair procedure including the extent of proposed repair and the need for the Surveyor's attendance during the voyage is to be submitted to the Society for approval sufficiently in advance. Failure to notify the Society in advance of the repairs may result in the suspension of class of the ship.

Where in any emergency circumstance, emergency repairs are to be effected immediately, the repairs should be documented in the ship's log and submitted thereafter to the Society for use in determining further survey requirements.

**2.10.2** The above is not intended to include maintenance to and overhaul of the hull, machinery and equipment in accordance with the Manufacturer's recommended procedures and established marine practice, which does not require the Society's agreement. However, any repair resulting from such maintenance and overhauls which affects or may affect the class is to be noted in the ship's log and submitted to the attending Surveyor for use in determining further survey requirements.

## **2.11 Repairs**

**2.11.1** Any damage in association with wastage over the allowable limits (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the ship's structural, watertight or weathertight integrity, is to be promptly and thoroughly (see [2.2.17]) repaired.

Areas to be considered include, as applicable for the different ship types:

- side structure and side plating; side shell frames, their end attachments and adjacent shell plating; inner side structure and inner side plating
- deck structure and deck plating
- bottom structure and bottom plating; inner bottom structure and inner bottom plating
- longitudinal bulkheads structure and longitudinal bulkheads plating, where fitted
- watertight or oiltight bulkheads structure and plating
- hatch covers or hatch coamings, where fitted
- weld connection between air pipes and deck plating
- air pipe heads installed on the exposed decks
- ventilators, including closing devices, if any; bunker and vent piping systems.

**2.11.2** For locations where adequate repair facilities are not available, consideration may be given to allow the ship to proceed directly to a repair facility. This may require discharging the cargo and/or temporary repairs for the intended voyage.

**2.11.3** Additionally, when a survey results in the identification of structural defects or corrosion, either of which, in the opinion of the Surveyor, will impair the vessel's fitness for continued service, remedial measures are to be implemented before the ship continues in service.

**2.11.4** Where the damage found on structure mentioned in [2.11.1] is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the Surveyor to allow an appropriate temporary repair to restore watertight or weathertight integrity and impose a condition of class in accordance with the Rules, with a specific time limit.

## **2.12 Remote Inspection Techniques (RIT)**

**2.12.1** The RIT is to provide the information normally obtained from a close-up survey (except on ESP ships). RIT surveys are to be carried out in accordance with the requirements given here-in and the requirements of IACS Recommendation 42, "Guidelines for use of remote inspection techniques for surveys". These considerations are to be included in the proposals for use of a RIT which are to be submitted in advance of the survey so that satisfactory arrangements can be agreed with the Society.

Note 1: Use of RIT as an alternative to close-up survey is normally not allowed for ships assigned the service notation **bulk carrier ESP** or **bulk carrier BC-A ESP** or **bulk carrier BC-B ESP** or **bulk carrier BC-C ESP** or **self-unloading bulk carrier ESP** or **ore carrier ESP** or **combination carrier/OBO ESP** or **combination carrier/OOC ESP** or **oil tanker ESP**, unless written agreement of the ship's Flag is obtained.

**2.12.2** The equipment and procedure for observing and reporting the survey using a RIT are to be discussed and agreed with the parties involved prior to the RIT survey, and suitable time is to be allowed to set-up, calibrate and test all equipment beforehand.

**2.12.3** When using a RIT as an alternative to close-up survey, if not carried out by the Society itself, it is to be conducted by a firm approved as a service supplier and is to be witnessed by an attending Surveyor of the Society.

Note 1: NR533, Approval of Service Suppliers, gives details about the certification.

**2.12.4** The structure to be examined using a RIT is to be sufficiently clean to permit meaningful examination. Visibility is to be sufficient to allow for a meaningful examination. The Society is to be satisfied with the methods of orientation on the structure.

**2.12.5** The Surveyor is to be satisfied with the method of data presentation including pictorial representation, and a good two-way communication between the Surveyor and RIT operator is to be provided.

**2.12.6** If the RIT reveals damage or deterioration that requires attention, the Surveyor may require traditional survey to be undertaken without the use of a RIT.

## **2.13 Remote survey**

**2.13.1** For the planning and execution of remote surveys, the requirements given in Ch 2, App 5 are to be applied.

### **3 Certificate of Classification: issue, validity, endorsement and renewal**

#### **3.1 Issue of Certificate of Classification**

**3.1.1** A Certificate of Classification, bearing the class notations assigned to the ship and an expiry date, is issued to any classed ship.

**3.1.2** A Provisional Certificate of Classification may serve as a Certificate of Classification in some cases, such as after an admission to class survey, after a class renewal survey, or when the Society deems it necessary.

The period of validity for the Provisional Certificate of Classification is not to exceed 6 months from the date of issuance.

**3.1.3** The Certificate of Classification is to be made available to the Society's Surveyors upon request.

#### **3.2 Validity of Certificate of Classification, maintenance of class**

**3.2.1** According to Ch 1, Sec 1, [2.4], the Society alone is qualified to confirm the class of the ship and the validity of its Certificate of Classification.

**3.2.2** During the class period, a Certificate of Classification is valid when it is not expired.

The class is maintained during a certain period or at a given date, when during the said period or at such date the conditions for suspension or withdrawal of class are not met.

Refer also to Ch 1, Sec 1, [1.3.4].

**3.2.3** At the request of the Owner, a statement confirming the maintenance of class may be issued by the Society based on the information in its records for that ship at the time.

This statement is issued on the assumption that the Owner has complied with the Rules, in particular with [6].

Should any information which would have prevented the Society from issuing the statement and which was not available at the time subsequently come to light, the statement may be cancelled.

Attention is drawn to Ch 2, Sec 3, [1.2], whereby the Society, upon becoming aware of a breach of the Rules, is empowered to suspend class from the date of the breach, which may be prior to the date of the statement.

**3.2.4** According to the same conditions as in [3.2.3], a statement declaring that the class is maintained "clean and free from condition of class" may be issued by the Society when there is no pending condition of class at that date.

**3.2.5** Classification-related documents and information are liable to be invalidated by the Society whenever their object is found to differ from that on which they were based or to be contrary to the applicable requirements. The Owner is liable for any damage which may be caused to any third party from improper use of such documents and information.

#### **3.3 Endorsement of Certificate of Classification**

##### **3.3.1 Text of endorsement**

When surveys are satisfactorily carried out, the Certificate of Classification is generally endorsed accordingly, with the relevant entries.

##### **3.3.2 Possible modifications to endorsements**

The Society reserves the right to modify the endorsements made by Surveyors.

#### **3.4 Status of surveys and conditions of class**

**3.4.1** Information given in the Certificate of Classification, ship survey status, Rules and other ship specific documents made available to the Owner, enables the Owner to identify the status of surveys and conditions of class.

**3.4.2** The omission of such information does not absolve the Owner from ensuring that surveys are held by the limit dates and pending conditions of class are cleared to avoid any inconvenience which is liable to result from the suspension or withdrawal of class; see Ch 2, Sec 3.

### **4 Class renewal survey**

#### **4.1 General principles**

**4.1.1** Class renewal surveys are to be carried out at five-year (class symbol **I**) or three-year (class symbol **II**) intervals. However, consideration may be given by the Society to granting an extension for a maximum of three months after the limit date, in exceptional circumstances. In such cases the next period of class will start from the limit date for the previous class renewal survey before the extension was granted.

**4.1.2** For surveys completed within three months before the limit date of the class renewal survey, the next period of class will start from this limit date. For surveys completed more than three months before the limit date, the period of class will start from the survey completion date.

In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the Owner elects to carry out only the overdue surveys, the next period of class will start from the expiry date of the renewal survey. If the Owner elects to carry out the next due renewal survey, the period of class will start from the survey completion date.

**4.1.3** A new period of class is assigned to the ship after the satisfactory completion of the class renewal survey, and a new Certificate of Classification is issued for the new period of class.

**4.1.4** Concurrent crediting to both Intermediate Survey and Class Renewal Survey for surveys and thickness measurements of spaces are not acceptable.

## **4.2 Normal survey system (SS)**

**4.2.1** When the normal survey system is applied to ships with a 5 years period of class, the class renewal survey may be commenced at the fourth annual survey and continued during the following year with a view to completion by its due date. In this case the survey may be carried out by partial surveys at different times. The number of checks to be performed at each partial survey and the interval between partial surveys are to be agreed by the Society.

**4.2.2** A class renewal survey may be commenced before the fourth annual survey at the request of the Owner. In this case, the survey is to be completed within fifteen months. The conditions for the execution of partial surveys are the same as those referred to in [4.2.1].

## **4.3 Continuous survey system (CS)**

**4.3.1** The request by the Owner for admission to the continuous survey system will be considered by the Society and agreement depends on the type and age of hull and machinery. This system may apply to the class renewal survey of hull (CSH), machinery (CSM) or other installations such as refrigerating installations (CSR) covered by an additional class notation.

**4.3.2** The continuous survey system is not applicable to the class renewal survey of the hull of those ships subject to the Enhanced Survey Program (ESP), i.e. ships with the service notation **oil tanker, combination carrier, bulk carrier, ore carrier or chemical tanker**, nor to ships subject to the requirements of Ch 4, Sec 7, nor to ships with the class symbol **II**.

**4.3.3** For ships other than those referred to in [4.3.2], the continuous survey system is not applicable to the class renewal survey of the hull of ships over 20 years old. However, consideration may be given, at the discretion of the Society, to the applicability of the continuous survey system to the class renewal survey of the hull of ships over 20 years old.

**4.3.4** When the continuous survey system is applied, appropriate notations as indicated in [4.3.1] are entered in the Register of Ships.

**4.3.5** Ships subject to the continuous survey system are provided with lists of items to be surveyed under this system.

**4.3.6** For items surveyed under the continuous survey system, the following requirements generally apply:

- a) the interval between two consecutive surveys of each item is not to exceed five years
- b) the items are to be surveyed in rotation, so far as practicable ensuring that approximately equivalent portions are examined each year
- c) the Society may credit for continuous survey results of surveys carried out before the admission to the continuous survey scheme
- d) each item is to be surveyed at one time, as far as practicable; the Society may, however, allow possible repair work to be carried out within a certain period.
- e) main or auxiliary engine crankshaft journal and associated bearings may be surveyed within intervals specified in item a) or in accordance with engine manufacturers recommended replacement schedule subject to satisfactory verification of survey items listed in item f)
- f) The Surveyor shall check within the 5 year CSM cycle:
  - at least 1 crank journal bearing for medium and high speed engines (> 300 rpm), with the selected bearing to be presented for survey chosen from 1 of the 3 aftermost bearings and alternate to the last CSM cycle
  - at least 2 crank journal bearings for slow speed engines (< 300 rpm), with the selected bearings to be presented for survey chosen from 1 of the 3 aftermost bearings (alternate to last CSM cycle) and the highest loaded bearing as determined by the engine manufacturer.

The remainder of the bearings may be permitted for verification by C/E followed by confirmatory surveys, i.e. checking bearing clearances, oil analysis, photos of non-invasive bearing and bearing edge checks performed, crankcase inspection and verification of deflections.

**4.3.7** For ships more than ten years of age, the ballast tanks are to be internally examined twice in each five-year class period, i.e. once within the scope of the intermediate survey and once within the scope of the continuous survey system for the class renewal survey.

**4.3.8** For ships under continuous survey, items not included in the continuous survey cycle are to be inspected according to the provisions given in [4.2]. Bottom surveys are to be carried out according to the requirements of [5.4]. In addition, the bottom survey which is to be carried out in conjunction with the end of class period is to be performed within 15 months before the end of this class period.

**4.3.9** Upon application by the Owner, the Society may agree, subject to certain conditions, that some items of machinery which are included in the continuous survey cycle are examined by the Chief Engineer where the Society is not represented. The Chief Engineer's inspection is to be followed by a confirmatory survey carried out by a Surveyor. The conditions for the application of this procedure are given in Ch 2, App 2.

**4.3.10** The continuous survey system does not supersede the annual surveys and other periodical and occasional surveys.

**4.3.11** A general examination of the ship, as detailed in Ch 3, Sec 1 for annual surveys, is to be carried out at the end of the period of class.

**4.3.12** For laid-up ships, specific requirements given in [8.1] apply.

**4.3.13** The continuous survey system may be discontinued at any time at the discretion of the Society, or at the request of the Owner, and a specific arrangement devised.

## **4.4 Planned maintenance survey system for machinery (PMS)**

**4.4.1** A planned maintenance survey system may be considered as an alternative to the continuous survey system for machinery and is limited to components and systems covered by it. When such a system is implemented, a survey system other than those normally adopted and with intervals different from those of the continuous survey system as detailed in [4.3] may be accepted.

**4.4.2** The conditions for review of the planned maintenance survey system, the determination of survey item intervals and the general scope of surveys are detailed in Ch 2, App 1.

**4.4.3** The conditions related to Chief Engineer's inspections within the scope of PMS are given in Ch 2, App 2.

**4.4.4** The planned maintenance survey system does not supersede the annual surveys and other periodical and occasional surveys.

**4.4.5** A general examination of the machinery, as detailed in Ch 3, Sec 1 for annual surveys, is to be carried out.

**4.4.6** The planned maintenance survey system may be discontinued at any time at the discretion of the Society, or at the request of the Owner, and a specific arrangement devised.

**4.4.7** Surveys of machinery may be carried out on a condition based maintenance (CBM) scheme basis on vessels operating on approved PMS survey system.

**4.4.8** The conditions for approval of the condition monitoring and condition based maintenance survey schemes and the general scope of surveys are detailed in Ch 2, App 4.

## **5 Other periodical surveys**

### **5.1 General**

**5.1.1** The different types of periodical surveys are summarised in Tab 1.

### **5.2 Annual surveys**

**5.2.1** Annual surveys are to be carried out within three months before or after each anniversary date.

### **5.3 Intermediate surveys**

**5.3.1** An intermediate survey, where applicable, is to be carried out within the window from three months before the second to three months after the third anniversary date.

**5.3.2** The intermediate survey is applicable at any period of class to ships with the following service notations:

- **oil tanker, chemical tanker, FLS tanker, liquefied gas carrier, combination carrier/OBO, combination carrier/OOC**
- **yacht** of less than 24 meters in length, as defined in NR500, Rules for the Classification and Certification of Yachts.

**5.3.3** The intermediate survey is applicable at any period of class to ships other than those indicated in [5.3.2] which are five years old and over.

**5.3.4** The intermediate survey is not applicable to ships with class symbol **II**.

**5.3.5** Concurrent crediting to both Intermediate Survey and Class Renewal Survey for surveys and thickness measurements of spaces are not acceptable.

## **5.4 Bottom survey**

**5.4.1** Bottom survey means the examination of the outside of the ship's bottom and related items. This examination may be carried out with the ship either in dry dock (or on a slipway) or afloat: in the former case the survey will be referred to as dry-docking survey, while in the latter case as in-water survey.

**5.4.2** The Owner is to notify the Society whenever the outside of the ship's bottom and related items can be examined in dry dock or on a slipway.

**5.4.3** For ships classed with the class symbol **I**, there are to be two examinations of the outside of the ship's bottom and related items in each period of class of five years

In all cases, the interval between any two such examinations is not to exceed 36 months.

Note 1: Compliance with the above does not absolve the Owner from compliance with the requirements of SOLAS as amended, especially when shorter intervals between examination of the ship's bottom for certain types of ships are required. Attention is also drawn to the relevant requirements of Ch 1, Sec 1, [3.1], concerning application of national and international regulations.

An extension of examination of the ship's bottom of three months beyond the due date can be granted in exceptional circumstances, as defined in [2.1.8].

**5.4.4** For ships under the normal survey system (SS), one of the bottom surveys to be performed in each period of class is to be carried out in conjunction with the class renewal survey and is to be a dry-docking survey.

The Society may allow the bottom survey carried out between class renewal surveys to be replaced by an in-water survey, subject to the provisions of Ch 3, Sec 4. Special consideration is to be given to ships of 15 years of age and over before being permitted to have such in-water examinations.

For ships with additional service feature **ESP** and over 15 years of age, it is however reminded that a bottom survey in dry dock is to be carried out concurrently with the intermediate survey.

**5.4.5** For ships under the continuous survey system of hull (CSH), one of the bottom surveys to be performed in each period of class is to be carried out in conjunction with the end of class period.

This bottom survey may be an in-water survey, subject to the provisions of Ch 3, Sec 4 and provided that the previous bottom survey performed in the period of class was a dry-docking survey. Special consideration is to be given to ships of 15 years of age and over before being permitted to have such in-water examinations.

**5.4.6** Ships with service notation **HSC, HSC-CAT A, HSC-CAT B** are to be submitted to a bottom survey in dry condition at each annual survey and each class renewal survey.

**5.4.7** The interval between examinations of the outside of the ship's bottom and related items for ships operating in fresh water and for certain harbour or non-self-propelled craft may be greater than that given above, as approved by the Society.

## **5.5 Tailshaft survey**

### **5.5.1 Definition**

Tailshaft survey means survey of propeller shafts and tube shafts (hereafter referred to as tailshafts) as well as survey of other propulsion systems.

### **5.5.2 Tailshaft complete survey**

Tailshafts are to be submitted to complete examination at the periodicity specified below and summarised in Fig 2, based on the type of shaft and its design.

- a) Where the tailshaft is fitted with continuous liners, or approved oil sealing glands, or made of corrosion-resistant material, the periodicity of complete surveys is:
  - 3 years for single shafting arrangements
  - 4 years for multi-shafting arrangements.
- b) These periodicities may be increased to 5 years in the following cases:
  - where the propeller is fitted keyless to the shaft taper, the shaft is protected from sea water, the design details are approved, and a non-destructive examination of the forward part of the aft shaft taper is performed at each survey by an approved crack-detection method

- where the propeller is fitted to a keyed shaft taper the design details of which comply with the applicable requirements in Pt C, Ch 1, Sec 7, and a non-destructive examination of the after end of the cylindrical part of the shaft (from the after end of the liner, if any), and of about one third of the length of the taper from the large end is performed at each survey by an approved crack-detection method
  - where the propeller is fitted to a solid flange coupling at the aft end of the shaft, the shaft and its fittings are not exposed to corrosion, the design details are approved. Non-destructive examination of the fillet radius of the aft propeller shaft flange may be required if the visual examination of the area is not satisfactory.
- c) In all other cases the periodicity of complete surveys is two years and six months (2,5 years).

**Figure 2 : Periodicity of complete survey of tailshaft**

- (a) : with shaft withdrawn, subject to modified survey at 5 years plus or minus 6 months
- (b) : with shaft in place, subject to modified survey at 5 years plus or minus 6 months
- (c) : the periodicity cannot exceed the maximum recommended by the designer and manufacturer of the tailshaft and bearing system.

Note 1: Shafts protected against corrosion are those:

- made of corrosion resistant material, or
- fitted with continuous liners or systems considered as equivalent, or
- fitted with oil lubricated bearings and oil sealing glands.

Note 2: Suitable sealing glands are glands which are type-approved by the Society with regard to protection of the sterntube against ingress of water.

### 5.5.3 Tailshaft modified survey

A modified survey of the tailshaft is an alternate way of examination the scope of which is given in Ch 3, Sec 5. It may be accepted for tailshafts described in [5.5.2] and for water lubricated tailshafts, provided that the design criteria for **MON-SHAFT** notation as per Pt F, Ch 5, Sec 2, [3] are fulfilled and that, accordingly:

- For ships fitted with oil lubricated tailshaft bearings:
  - the tailshafts are fitted with approved oil sealing glands
  - the shaft and its fittings are not exposed to corrosion
  - the design details are approved
  - the clearances of the aft bearing are found to be within acceptable limits
  - the oil and the oil sealing arrangements prove effective
  - lubricating oil analyses are carried out regularly at intervals not exceeding six months and oil consumption is recorded at the same intervals.
- For ships fitted with water lubricated tailshaft bearings:
  - the clearances of the aft bearing are found to be within acceptable limits
  - the results of the endoscopic examination are found satisfactory

Note 1: Note 1: The purpose of the endoscopic examination is to check visually the condition of the shaft in particular in way of bearings and at junction with sleeves (where provided)

- in case of forced lubrication system, satisfactory operation of water pumping and filtering system has been checked
- if applicable, water analyses have been carried out and recorded, at regular intervals not exceeding six months.

The modified survey is to be carried out five years after the last complete survey, with a window period of plus or minus six months.

The next complete survey is to be carried out ten years after the last complete survey.

### 5.5.4 Survey of propeller shafts and tube shafts - Applicable requirements from 1 January 2016

Reference is to be made to Ch 3, Sec 5, [3] for revised requirements applicable to all ships with conventional shafting fitted with a propeller, unless alternative means are provided to assure the condition of the propeller shaft assembly.

Such requirements are applicable:

- from 1 January 2016, for ships delivered on or after 1 January 2016
- after the first shaft survey scheduled on or after 1 January 2016, for ships delivered before 1 January 2016.

### 5.5.5 Other propulsion systems

Driving components serving the same purpose as the tailshaft in other propulsion systems, such as directional propellers, vertical axis propellers, water jet units, dynamic positioning systems and thruster assisted mooring systems, are to be submitted to periodical surveys at intervals not exceeding five years.

### 5.5.6 Pod propulsion systems

Shafting system (including tightness system and connection of the propeller to the shaft) of pod propulsion systems are to be submitted to complete or modified surveys, the periodicity of which is determined in the same principle as for tailshafts described in [5.5.2], [5.5.3] and Fig 2.

Propulsion motors, orientating devices and other arrangement, are to be surveyed at each class renewal survey, see Ch 3, Sec 3, [3.2.7].

## 5.6 Boiler survey

**5.6.1** There are to be two internal examinations of boilers in each period of class of five years.

In all cases, the interval between any two such examinations is not to exceed 36 months.

**5.6.2** The internal examination of thermal oil heaters is to be carried out once during each 5-year period in conjunction with the renewal survey.

**5.6.3** An extension of examination of the boiler up to three months beyond the due date can be granted in exceptional circumstances, as defined in [2.1.8]. The extension may be granted by the Society after the following is satisfactorily carried out:

- external examination of the boiler
- examination and operational test of boiler safety valve relieving gear (easing gear)
- operational test of boiler protective devices
- review of the following records since the last boiler survey: operation, maintenance, repair history, feedwater chemistry.

**5.6.4** Boilers are also submitted to an external examination as a part of the annual survey of machinery.

## 5.7 Links between anniversary dates and annual surveys, intermediate surveys and class renewal surveys

5.7.1 The link between the anniversary dates, the class renewal survey (when carried out according to the normal system), and the annual and intermediate surveys is given in Fig 3.

Figure 3 : Links between anniversary dates and annual, intermediate and class renewal surveys

## 6 Occasional surveys

### 6.1 General

6.1.1 An occasional survey is any survey which is not a periodical survey. The survey may be defined as an occasional survey of hull, machinery, boilers, refrigerating plants, etc., depending on the part of the ship concerned. Where defects are found, the Surveyor may extend the scope of the survey as deemed necessary.

6.1.2 Occasional surveys are carried out at the time of, for example:

- updating of classification documents (e.g. change of the Owner, name of the ship, flag)
- damage or suspected damage
- repair or renewal work
- Port State Control inspections
- alterations or conversion
- quality system audits
- postponement of surveys or conditions of class.

### 6.2 Damage and repair surveys

6.2.1 In the event of damage which affects or may affect the class of the ship, the Owner is to apply to the Society for a survey. Such application is to be made as soon as possible to enable the Surveyor to ascertain the extent of the damage and necessary repairs, if any.

Note 1: Whenever a ship is fitted with an helicopter platform which is made in aluminium or other low melting metal construction which is not made equivalent to steel, and a fire occurred on the said platform or in close proximity, the platform is to be subject to a structural survey to determine its suitability for further use.

6.2.2 If, after sustaining damage, the ship calls at a port where the Society is not represented, the Owner is to notify the Society forthwith, supply all available information regarding the damage and make arrangements for the ship to be surveyed in the nearest port where the Society is represented.

6.2.3 All repairs to hull, machinery and equipment which may be required in order for a ship to retain its class are to be to the satisfaction of the Surveyor.

During repairs or maintenance work, the Owner is to arrange so that any damage, defects or non-compliance with the rule requirements are reported to the Surveyor during his survey.

6.2.4 Damages and partial or temporary repairs considered acceptable by the Surveyor for a limited period of time are the subject of an appropriate condition of class.

6.2.5 Damages or repairs required by the Surveyor to be re-examined after a certain period of time are the subject of an appropriate condition of class.

### **6.3 Port State Control survey**

**6.3.1** An occasional survey is to be requested by the Owner wherever a ship is detained as a result of a Port State Control inspection, as described in Ch 1, Sec 1, [3.4].

### **6.4 Conversions, alterations and repairs**

**6.4.1** Conversions, alterations or repairs of/to structures and arrangements affecting the class are to be carried out in accordance with the requirements of the Society and to its satisfaction. Where necessary, documentation is to be submitted to the Society and/or made available to the attending Surveyor.

**6.4.2** Materials and equipment used for conversions, alterations or repairs are generally to meet the requirements of the Rules for new ships built under survey; see Ch 2, Sec 1, [2.1.5].

### **6.5 Quality System audits**

**6.5.1** The Society reserves the right to carry out occasional surveys in order to conduct audits either as deemed necessary in pursuance of its internal Quality System or as required by external organisations (e.g. IACS, flag Administrations).

**6.5.2** These surveys may also be attended by auditors external to the Society.

**6.5.3** The scope of these surveys is determined by the Society.

### **6.6 Unscheduled surveys**

**6.6.1** The Society reserves the right to carry out unscheduled surveys as deemed necessary and whose scope is determined by the Society, based on PSC (Port State Control) history of the ship.

## **7 Change of ownership**

### **7.1**

**7.1.1** In the case of change of ownership, the ship retains its current class with the Society provided that:

- the Society is informed of the change sufficiently in advance to carry out any specific survey required by the Owner in view of the sale; refer to [1.1.1], and
- the new Owner signs the appropriate request, involving acceptance of the Society's general conditions and Rules. This request covers inter alia the condition of the ship when changing ownership.

Note 1: The ship's class is maintained without prejudice to those provisions in the Rules which are to be enforced in cases likely to cause suspension or withdrawal of the class such as particular damages or repairs to the ship of which the Society has not been advised by the former or, as the case may be, new Owner.

Note 2: No information whatsoever related to the class of the ship will be provided or confirmed to any third party, unless the appropriate request for information is duly completed and signed by the party making the request and the authorisation of the current Owner is obtained.

## **8 Lay-up and re-commissioning**

### **8.1 General principles**

**8.1.1** A ship put out of commission may be subject to specific requirements for maintenance of class, as specified below, provided that the Owner notifies the Society of the fact.

If the Owner does not notify the Society of the laying-up of the ship or does not implement the lay-up maintenance program, the ship's class may be suspended and/or withdrawn when the due surveys are not carried out by their limit dates in accordance with the applicable requirements given in Ch 2, Sec 3.

**8.1.2** The lay-up maintenance program provides for a "laying-up survey" to be performed at the beginning of lay-up and subsequent "annual lay-up condition surveys" to be performed in lieu of the normal annual surveys which are no longer required to be carried out as long as the ship remains laid-up. The minimum content of the lay-up maintenance program as well as the scope of these surveys are given in Ch 3, App 1. The other periodical surveys which become overdue during the lay-up period may be postponed until the re-commissioning of the ship.

**8.1.3** Where the ship has an approved lay-up maintenance program and its period of class expires, the period of class is extended until it is re-commissioned, subject to the satisfactory completion of the annual lay-up condition surveys as described in [8.1.2].

**8.1.4** The periodical surveys carried out during the lay-up period may be credited, either wholly or in part, at the discretion of the Society, having particular regard to their extent and dates. These surveys will be taken into account for the determination of the extent of surveys required for the re-commissioning of the ship and/or the expiry dates of the next periodical surveys of the same type.

**8.1.5** When a ship is re-commissioned, the Owner is to notify the Society and make provisions for the ship to be submitted to the following surveys:

- an occasional survey prior to re-commissioning, the scope of which depends on the duration of the lay-up period
- all periodical surveys which have been postponed in accordance with [8.1.2], taking into account the provisions of [8.1.4].

**8.1.6** Where the previous period of class expired before the re-commissioning and was extended as stated in [8.1.3], in addition to the provisions of [8.1.5] a complete class renewal survey is to be carried out prior to re-commissioning. Those items which have been surveyed in compliance with the class renewal survey requirements during the 15 months preceding the re-commissioning may be credited. A new period of class is assigned from the completion of this class renewal survey.

**8.1.7** The principles of intervals or limit dates for surveys to be carried out during the lay-up period, as stated in [8.1.1] to [8.1.6], are summarised in Fig 4.

**8.1.8** The scope of the laying-up survey and annual lay-up condition surveys are described in detail in Ch 3, App 1.

**Figure 4 : Survey scheme of a case of a lay-up going beyond the expiry date of the period of class**

Note 1: A. C. S. means annual lay-up condition survey.

## 9 Safety Management System

### 9.1

**9.1.1** For all ships to which the ISM Code applies, the Society may have to report possible safety management system shortcomings, on the occasion of the Annual Survey or Intermediate Survey or Class Renewal Survey or Occasional Surveys or Statutory Surveys, to the Organisation that has issued the Safety Management Certificate.

## Section 3 Suspension and Withdrawal of Class

### 1 General

#### 1.1 Discontinuance of class

**1.1.1** The class may be discontinued either temporarily or permanently. In the former case it is referred to as “suspension” of class, in the latter case as “withdrawal” of class. In both these cases, the class is invalidated in all respects. In the case of withdrawal, the name of the ship is deleted from the Register of Ships. The current version of the Register can be consulted on the Society website.

#### 1.2 Suspension of class

**1.2.1** The class may be suspended either automatically or following the decision of the Society. In any event, the ship will be considered as not retaining its class from the date of suspension until the date when class is reinstated.

**1.2.2** The class may be automatically suspended when one or more of the following circumstances occur:

- when a ship is not operated in compliance with the rule requirements, such as in cases of services or conditions not covered by the service notation, or trade outside the navigation restrictions for which the class was assigned
- when a ship proceeds to sea with less freeboard than that assigned, or has the freeboard marks placed on the sides in a position higher than that assigned, or, in cases of ships where freeboards are not assigned, the draught is greater than that assigned
- when the Owner fails to inform the Society in order to submit the ship to a survey after defects or damages affecting the class have been detected
- when repairs, alterations or conversions affecting the class are carried out either without requesting the attendance of the Society or not to the satisfaction of the Surveyor. For voyage repairs, reference is to be made to Ch 2, Sec 2, [2.10].

Suspension of class with respect to the above cases will remain in effect until such time as the cause giving rise to suspension has been removed. Moreover, the Society may require any additional surveys deemed necessary taking into account the condition of the ship and the cause of the suspension.

**1.2.3** In addition, the class is automatically suspended:

- when the class renewal survey has not been completed by its limit date or within the time granted for the completion of the survey, unless the ship is under attendance by the Society’s Surveyors with a view to completion prior to resuming trading
- when the annual or intermediate surveys have not been completed by the end of the corresponding survey time window (see Ch 2, Sec 2, [2.1.3]) unless the ship is under attendance for completion of the survey.

Continuous survey item(s) due or overdue at the time of annual surveys is (are) to be dealt with. The ship's class will be subject to a suspension procedure if the item(s) is (are) not surveyed or postponed by agreement with the Society.

Suspension of class with respect to the above cases will remain in effect until such time as the class is reinstated once the due items and/or surveys have been dealt with.

**1.2.4** In addition to the circumstances for which automatic suspension may apply, the class of a ship may also be suspended following the decision of the Society:

- when a condition of class is not dealt with within the time limit specified, unless it is postponed before the limit date by agreement with the Society
- when one or more surveys are not held by their limit dates (see Ch 2, Sec 2, [2.1.4]) or the dates stipulated by the Society also taking into account any extensions granted in accordance with the provisions of Part A
- when, due to reported defects, the Society considers that a ship is not entitled to retain its class even on a temporary basis (pending necessary repairs or renewals, etc.)
- when the ship has not been maintained in proper condition, as set forth in Ch 1, Sec 1, [3.3.2]
- in other circumstances which the Society will consider on their merits (e.g. in the event of non-payment of fees or where the Owner fails to render the ship available for the occasional surveys as listed in Ch 2, Sec 2, [6.1.2]).

Suspension of class decided by the Society takes effect from the date when the conditions for suspension of class are met and will remain in effect until such time as the class is reinstated once the due items and/or surveys have been dealt with.

### **1.3 Withdrawal of class**

**1.3.1** The Society will withdraw the class of a ship in the following cases:

- at the request of the Owner
- as a rule, when the causes that have given rise to a suspension currently in effect have not been removed within six months after due notification of suspension to the Owner
- when the ship is reported as a constructive total loss
- when the ship is lost
- when the ship is reported scrapped.

Withdrawal of class may take effect from the date on which the circumstances causing such withdrawal occur.

The contract for the classification of the ship is terminated as of right in the above cases.

The class is also withdrawn according to the provisions of article 9 of the Marine & Offshore General Conditions in case of contract termination.

**1.3.2** When the withdrawal of class of a ship comes into effect, the Society will:

- forward the Owner written notice
- delete the ship from the Register of Ships
- notify the flag Administration
- make the information available to the Underwriters, at their request.

### **1.4 Suspension/withdrawal of additional class notations**

**1.4.1** If the survey requirements related to maintenance of additional class notations are not complied with, the suspension or withdrawal may be limited to the notations concerned.

The same procedure may apply to service notations of ships which are assigned with more than one service notation.

**1.4.2** The suspension or withdrawal of an additional class notation or a service notation (where a ship is assigned with more than one service notation) generally does not affect the class.

# Appendix 1      Planned Maintenance Survey System

## 1 General

### 1.1

**1.1.1** A Planned Maintenance Survey system (hereafter referred to as PMS) is a survey system for machinery items which may be considered as an alternative to the Continuous Survey for Machinery system (hereafter referred to as CSM), as described in Ch 2, Sec 2, [4.4].

**1.1.2** This survey scheme is to be approved by the Society before being implemented. When the PMS system is applied, the scope and periodicity of the class renewal survey are tailored for each individual item of machinery and determined on the basis of recommended overhauls stipulated by the manufacturers, documented experience of the operators and, where applicable and fitted, condition monitoring. For instance, within the scope of a PMS system the following cases may occur:

- switchboard A is surveyed based on the regular expiry date of the class renewal survey
- lubricating oil pump B is surveyed based on CSM scope and periodicity
- diesel engine C is surveyed based on running hours
- turbo pump D is surveyed based on condition monitoring.

**1.1.3** In general, the survey intervals for items surveyed under the PMS system should not exceed those specified for the CSM. However, for components where the maintenance is based on running hours, longer intervals may be accepted as long as the intervals are based on the manufacturer's recommendations.

**1.1.4** The Chief Engineer shall be the responsible person on board in charge of the PMS.

The conditions related to Chief Engineer's inspections within the scope of PMS are given in Ch 2, App 2.

Items surveyed by this authorised Chief Engineer will be subject to the confirmatory survey as detailed in Ch 2, App 2.

Documentation on overhauls of items covered by the PMS are to be reported and signed by the Chief Engineer.

**1.1.5** The conditions and procedures for the review of a PMS are indicated in Article [2].

**1.1.6** For machinery undergoing maintenance based on condition monitoring, reference is made to Ch 2, App 4.

## 2 Conditions and procedures for the review of the system

### 2.1 General

**2.1.1** The PMS documentation is to be subject to a consistency check. To this end the Owner is to make a formal request to the Society and provide the documentation and information specified in [2.2], combined in a manual describing the proposed scheme and including sample copies of the different documents to be used during the implementation of the scheme. The PMS is to be programmed and maintained by a computerized system. However, this may not be applied to the current already reviewed schemes.

**2.1.2** When using computerised systems, access for updating of the maintenance documentation and the maintenance programmes is only granted to the person responsible for the PMS or another person authorised by him.

The computerised systems are to include a back-up procedure, which is to be activated at regular intervals.

The Owner himself is to confirm to the Society, by written declaration, that the required functionalities of the system are met. Or, alternatively, the Society may approve the software upon specific request.

### 2.2 Documentation

**2.2.1** The documentation to be submitted is the manual mentioned above, which is to include:

- a) a description of the scheme and its application on board as well as the proposed organisation chart identifying the areas of responsibility and the people responsible for the PMS on board
- b) the document flow and pertinent filing procedure
- c) the list of items of machinery and components to be considered for classification in the PMS, distinguishing for each the principle of survey periodicity used as indicated in [1.1.2]
- d) the procedure for the identification of the items listed in c), which is to be compatible with the identification system adopted by the Society

- e) the scope and time schedule of the maintenance procedures for each item listed in c), including acceptable limit conditions of the parameters to be monitored based on the manufacturers' recommendations or recognised standards and laid down in appropriate preventive maintenance sheets.

### **2.3 Information on board**

**2.3.1** The following information is to be available on board:

- a) all the documentation listed in [2.2], duly updated
- b) the maintenance instructions including routine tests and inspections for each item of machinery, as applicable (supplied by the manufacturer or by the shipyard)
- c) reference documentation (trend investigation procedures etc.)
- d) the records of maintenance performed, including conditions found, repairs carried out, spare parts fitted
- e) the list of personnel on board in charge of the PMS management.

### **2.4 List of items**

**2.4.1** Ships subject to the planned maintenance survey system are provided with lists of items to be surveyed under this system, as indicated in [5.2.9].

## **3 Implementation of the system**

### **3.1**

**3.1.1** When the documentation submitted has been checked for consistency and the PMS system has been implemented on board and used for a sufficient period (which is not to exceed one year) so that all personnel become familiar with it, a survey is to be carried out in order to start the system and make it officially operational. The scope of this survey, referred to as Implementation Survey, is given in [5.1.1].

**3.1.2** Upon the successful outcome of the Implementation Survey, the PMS is considered approved.

## **4 Retention and withdrawal of the system**

### **4.1**

**4.1.1** The PMS system is retained throughout the class period provided that:

- an annual report covering the year's service is supplied to the Society in accordance with [5.2.8]
- an annual audit in accordance with [5.2] is satisfactorily completed
- any change to the approved PMS is submitted to the Society for agreement.

**4.1.2** The survey arrangement for machinery according to the PMS may be withdrawn by the Society if the PMS is not satisfactorily operated on account of either the maintenance records or the general condition of the machinery or the failure to observe the agreed intervals between overhauls.

**4.1.3** The Owner may discontinue the PMS at any time by informing the Society in writing. In this case, the items which have been inspected under the PMS since the last annual audit will be credited for class at the discretion of the attending Surveyor.

**4.1.4** In the case of sale or change of management of the ship or classification after construction, the assignment of the PMS will be reconsidered.

## **5 Surveys**

### **5.1 Implementation survey**

**5.1.1** The implementation survey is to be carried out by a Surveyor of the Society, as stated in [3.1.1], within one year from the date of approval of the PMS.

**5.1.2** The scope of this survey is to verify that:

- the PMS is implemented in accordance with the documentation which has been checked and is suitable for the type and complexity of the components and systems on board
- the documentation required for the annual audit is produced by the PMS
- the requirements of surveys and testing for retention of class are complied with
- the shipboard personnel are familiar with the PMS procedures.

Upon the successful outcome of the survey confirming the proper implementation of the PMS, the system is considered operational subject to the submission to the Society of a report describing the PMS.

### 5.2 Annual audit and confirmatory surveys

**5.2.1** Once the PMS system is implemented, the continued compliance with the requirements for checks, overhauls and repairs, where needed, indicated in [2] is to be verified by means of annual audits and confirmatory surveys in order to confirm the validity of the approved survey scheme system.

**5.2.2** The annual audit and confirmatory surveys are to be carried out in conjunction with the annual class surveys.

**5.2.3** The purpose of this audit is to verify that the scheme is being correctly operated, in particular that all items (to be surveyed in the relevant period) have actually been surveyed in due time. A general examination of the items concerned is carried out.

**5.2.4** The maintenance and performance records are examined to verify that the machinery has been functioning satisfactorily since the previous survey or audit or, if necessary, that the necessary measures have been taken in response to machinery operating parameters exceeding acceptable tolerances, and that the overhaul intervals have been observed.

**5.2.5** Written reports of breakdown or malfunction are to be made available.

**5.2.6** The description of the repairs, if any, carried out is to be examined. Any machinery part or component which has been replaced by a spare due to damage is to be retained on board, where possible. On this occasion such replaced parts are to be submitted to the examination of the Surveyor.

**5.2.7** The Surveyor also checks that the personnel on board in charge of the PMS have the appropriate authorisation (see Ch 2, App 2).

**5.2.8** An annual report covering the year's service is to be supplied to the Society. It is to include the information as required by items c) and e) of [2.2.1] above, as well as the information on changes to other requirements in [2.2.1].

The Surveyor is to review this annual report or verify that it has been reviewed by the Society.

**5.2.9** The Surveyor carries out a confirmatory survey of the items which have been surveyed by the Chief Engineer and decides which items can be confirmed for classification, on the PMS list of items.

### 5.3 Damage and repairs

**5.3.1** Damage to components or items of machinery covered by the PMS which may affect the class is to be reported to the Society. Where applicable, a Surveyor will attend on board, survey the damaged items and, on the basis of the survey results, decide whether conditions of class are to be imposed.

**5.3.2** All parts of machinery or components which need to undergo substantial repairs are to be surveyed before, during and after the repairs, as deemed appropriate by the Surveyor. Any repair and corrective action regarding machinery under PMS system shall be recorded in the PMS logbook and repairs verified by the Surveyor at the annual audit.

**5.3.3** In the case of overdue condition of class or records of unrepaired damage which may affect the PMS, the relevant items are to be taken out of the PMS until the conditions of class have been fulfilled or the repairs carried out.

# Appendix 2 CSM and PMS Systems: Surveys Carried out by the Chief Engineer

## 1 Conditions

### 1.1

**1.1.1** The basic conditions for the acknowledgment of surveys carried out by Chief Engineers are specified hereafter. Consideration may be given to other conditions on a case by case basis.

**1.1.2** An Owner's attestation, confirming that the Chief Engineer is duly qualified to carry out the inspection of the machinery items when the CSM system or PMS system, as applicable, is implemented on-board ships in accordance with the requirements in [2.1.1] and [2.1.2], is to be made available to the Surveyor on-board.

## 2 Limits of the interventions

### 2.1

**2.1.1** For ships where the CSM system is implemented, the following items of the class renewal survey for machinery cannot be inspected by the Chief Engineer:

- pressure vessels
- main and auxiliary turbines
- main reduction gears
- turbochargers of main propulsion internal combustion engines
- intermediate shafting and associated bearings.

**2.1.2** For ships where the PMS system is implemented, all items covered by the system can be surveyed by the Chief Engineer, with the exception of pressure vessels.

**2.1.3** In no case may the surveys of tailshafts and boilers, which are items not included in the scope of the class renewal survey, be carried out by the Chief Engineer.

## 3 Procedure for carrying out surveys

### 3.1 General

**3.1.1** As regards the procedure for carrying out surveys, the Owner is to inform the Chief Engineer that surveys are to be conducted in accordance with the Rules of the Society and, specifically, the requirements for class renewal surveys related to machinery and systems contained in Ch 3, Sec 3, [3].

It is the responsibility of the ship's Captain and Chief Engineer to decide the date and place for the survey of each component in order to avoid possible accidents (fire included) in the event of damage to the unit(s) remaining in service.

Some guidelines for the Chief Engineer relevant to the dismantling and inspections of main components of the machinery installation are given below.

The items and/or machinery which, as a result of the surveys, are replaced due to wear, damage or defects, are to be kept on board until they are inspected by a Surveyor of the Society.

### 3.2 Main diesel engines

**3.2.1** The following items are to be surveyed as indicated:

- the top and bottom halves of the main bearings are to be removed and inspected, and the clearances are to be taken, recorded and compared with the limits recommended by the engine builder
- the top and bottom halves of bottom end connecting rod bearings are to be examined, and the clearances are to be taken, recorded and compared with the limits recommended by the engine builder
- crankpins, journals and webs are to be examined for crack detection, mainly at the fillets and in the vicinity of the lubricating oil holes
- crankshaft deflections are to be taken and recorded at regular intervals, enabling verification of the trend when they are taken in the presence of the Society's Surveyor. This operation is to be effected bearing in mind that during the readings the journals are to be steady on their bearings

- other parts exposed to wear or operating incidents are to be carefully examined and the results recorded. In particular, the wear of liners is to be measured and recorded.

### 3.3 Auxiliary diesel engines

**3.3.1** The survey generally consists of the complete dismantling of the engine and a careful examination of those items most liable to be exposed to wear or operating incidents. In particular:

- crankshaft deflections and wear of cylinder liners are to be measured
- the crankshaft is to be checked by means of dye penetrant in way of fillets and lubricating oil holes
- all top halves of the main bearings together with at least two bottom halves are to be dismantled
- crankcase explosion relief valves, if fitted, are to be checked.

### 3.4 Reciprocating compressors

**3.4.1** The survey is to include:

- the dismantling of pistons and valves for inspection
- the examination and testing of the nest of cooler tubes
- the verification of safety relief valves after reassembling.

### 3.5 Coolers, condensers, heaters

**3.5.1** The survey is to include:

- the dismantling of the covers
- the examination of the nest of tubes
- the testing of the nest of tubes, if necessary.

### 3.6 Electrical switchboard

**3.6.1** The survey is to include:

- the cleaning of the switchboard
- the verification of the connection assemblies, locking device tightening and busbar tightening
- the examination of the condition of the circuit-breakers, switches and fuses
- the verification of the contacts and screens
- the checking of the measuring instruments, which are to be re-calibrated or replaced, if inaccurate
- the insulation resistance test.

### 3.7 a.c. and d.c. generators

**3.7.1** The survey is to include:

- the removal of protection plates and brush carriers
- the cleaning of field coils and armature windings
- the verification of proper contact of brushes, which are to be renewed if excessively worn
- the verification of commutators and sliprings
- the measurement of air gap clearances
- the checking of journals and bearings
- the insulation resistance test.

### 3.8 Other items (pumps, electric motors, etc.)

**3.8.1** The survey is generally to include the complete dismantling for inspection of the main parts exposed to wear or operating incidents, such as bearings, casings, impellers and rotors.

## 4 Records of surveys carried out

### 4.1

**4.1.1** The surveys carried out by the Chief Engineer are to be recorded in the engine/machinery log-book and a survey report is to be prepared for each item surveyed.

The report is generally to be drawn up in English; however, for ships trading in specific restricted areas the use of the language of the country concerned will be accepted.

The report may be provided in hard copy or using a computerised recording system.

**4.1.2** The report is to indicate the following information:

- identification data:
  - name of ship and register number
  - name of Chief Engineer and Owner's attestation
  - date and place (port or voyage leg) of the survey
  - reference of the item in the CSM or PMS list, and description of the item
- inspection conducted:
  - the type of inspection carried out: visual external examination, internal examination after dismantling, overhaul
  - readings performed, when applicable: clearances, measurements, working pressure, or other working parameters of the equipment
  - inspection findings: corrosion, fractures, pieces of equipment worn out, broken or missing
- maintenance and repairs carried out and parts replaced
- results of tests performed after the inspection, such as working test, pressure test.

For sake of completeness, other documentation such as sketches, photos, measurement reports may be attached to the report. The report is to be signed by the Chief Engineer.

## 5 Confirmatory survey

### 5.1

**5.1.1** A confirmatory survey, to be carried out by a Surveyor of the Society, is to be requested according to the following principle:

- for ships under the CSM system, within a reasonably short time from the date of the surveys carried out by the Chief Engineer, and, in any case, in the first port which is under the jurisdiction of an Office of the Society
- for ships under the PMS system, at the next annual audit (see Ch 2, App 1, [5.2]).

**5.1.2** The Surveyor is to be supplied with a copy of this survey report and also shown the engine log-book.

**5.1.3** The Surveyor carries out an external examination of the relevant items and parts replaced and, if applicable, attends running tests. If doubts arise, the Surveyor may request dismantling as deemed necessary.

**5.1.4** For confirmatory survey of the main engine crankshaft and bearings, the Surveyor performs the following:

- check of condition monitoring records
- check of crankshaft deflection readings
- check of bearing clearances (where possible)
- checks for signs of wiped or broken white metal in the crankcase or filters
- check of the witness marks of shrink fits of crankshafts
- check of the bedplate structure (inside and outside)
- check that the condition of crankpins, journals and associated bearings is duly recorded.

**5.1.5** Where the confirmatory survey is performed with an abnormal delay, the inspection is to be more extensive and, if necessary, the due surveys are to be completely repeated.

**5.1.6** The date of the execution of the surveys will be assumed to be the date of the confirmatory survey.

## 6 Suspension of the Chief Engineer's authorization

### 6.1

**6.1.1** Where the condition of the items surveyed by the Chief Engineer as specified in his or her reports does not correspond to the findings of the attending Surveyor, or in case of doubt on the general maintenance of the machinery installation, the Society may request the Owner to withdraw the Chief Engineer qualification attestation until further training and re-assessment of his/her qualification.

# Appendix 3 Thickness Measurements: Extent, Determination of Locations, Acceptance Criteria

## 1 General

### 1.1 Aim of the Appendix

**1.1.1** Thickness measurements are a major part of surveys to be carried out for the maintenance of class, and the analysis of these measurements is a prominent factor in the determination and extent of the repairs and renewals of the ship's structure.

**1.1.2** The Appendix is intended to provide Owners, companies performing thickness measurements and the Society's Surveyors with a uniform means with a view to fulfilling Rule requirements for thickness measurements. In particular, it will enable all the above-mentioned parties to carry out:

- the planning and preparation
- the determination of extent and location, and
- the analysis

of the thickness measurements in cooperation.

**1.1.3** It is to be noted that this Appendix also takes into account specific requirements for thickness measurements relevant to close-up surveys of ships which are subject to the Enhanced Survey Program (ESP).

### 1.2 Scope of the Appendix

**1.2.1** Separate Articles below provide the following information:

- references to rule requirements and some additional information on the extent of the thickness measurements to be performed during surveys according to types of ships and related surveys (see [2])
- locations of the measurements for the main parts of the ship (see [3])
- how to analyse the results of thickness measurements (see [4]).

Tables and sketches are also given to detail the above points according to the types of ships.

## 2 Rule requirements for the extent of measurements

### 2.1 General

**2.1.1** For the maintenance of class, thickness measurements may be required during annual, intermediate and class renewal surveys.

Tab 1 gives the references to the requirements for minimum thickness measurements indicated in Part A, Chapter 3 and Part A, Chapter 4 for each service notation and related to the different types of surveys.

Some additional explanations are also given about the wording used in the Rules as well as the general principles of the required thickness measurements during class renewal surveys.

### 2.2 Class renewal survey: all ships except those submitted to ESP or equivalent

**2.2.1** The thickness measurements required by the Rules consist of:

- systematic thickness measurements, i.e. measurements of different parts of the structure, in order to assess the overall and local strength of the ship
- measurements of suspect areas as defined in Ch 2, Sec 2, [2.2.11]
- additional measurements on areas determined as affected by substantial corrosion as defined in Ch 2, Sec 2, [2.2.7].

**Table 1 : References to rule requirements related to thickness measurements**

**2.3 Class renewal survey: ships submitted to ESP or equivalent**

**2.3.1** The thickness measurements required by the Rules consist of:

- systematic thickness measurements in order to assess the overall and local strength of the ship
- thickness measurements as indicated in the program of close-up survey
- measurements of elements considered as suspect areas as defined in Ch 2, Sec 2, [2.2.11]
- additional measurements on areas determined as affected by substantial corrosion as defined in Ch 2, Sec 2, [2.2.7].

**2.3.2** For the determination of close-up surveys and relevant thickness measurements as well as the areas considered as suspect areas, reference is to be made to the relevant Sections of Part A, Chapter 4 according to the different service notations of the ships.

**3 Number and locations of measurements**

**3.1 General**

**3.1.1** Considering the extent of thickness measurements as required by the Rules and indicated in [2], the locations of the points to be measured are given here for the most important items of the structure. Thus the number of points can be estimated.

Note 1: This Article applies to ships built under the Common Structural Rules as well as ships not built under the Common Structural Rules, as specified.

**3.2 Locations of points**

**3.2.1** Tab 2 provides explanations and/or interpretations for the application of those requirements indicated in the Rules which refer to both systematic thickness measurements related to the calculation of global hull girder strength and specific measurements connected to close-up surveys.

Figures are also given to facilitate the explanations and/or interpretations given in the table. These figures show typical arrangements of cargo ships, bulk carriers and oil tankers. Due to the various designs of the other ship types, figures are not given to cover all the different cases. However, the figures provided here may be used as guidance for ships other than those illustrated.

**Table 2 : Interpretations of rule requirements for the locations and number of points to be measured**

A) SYSTEMATIC MEASUREMENTS		
ITEM	INTERPRETATION	FIGURE
Selected plates on deck, tank top, bottom, double bottom and wind-and-water (for all ship types including CSR ships)	“Selected” means at least a single point on one out of three plates, to be chosen on representative areas of average corrosion	No figure
All deck, tank top and bottom plates and wind-and-water strakes (for all ship types including CSR ships)	At least two points on each plate to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion	No figure

Transverse section (for all ship types including CSR ships)	Refer to the definition given in Ch 2, Sec 2, [2.2.5] One point to be taken on each plate. Both web and flange to be measured on longitudinals, if applicable (for CSR oil tankers) For tankers older than 10 years of age: within 0,1D (where D is the ship's moulded depth) of the deck and bottom at each transverse section to be measured, every longitudinal and girder is to be measured on the web and face plate, and every plate is to be measured at one point between longitudinals (for CSR oil tankers)	Fig 1 for general cargo ships Fig 2 for bulk carriers including CSR bulk carriers Fig 3 for oil tankers Fig 15 for CSR oil tankers For other ship types, see [3.2.1]
All cargo hold hatch covers and coamings (for all ship types except CSR oil tankers)	Including plates and stiffeners (for CSR single skin and double skin bulk carriers)	Fig 4 for ships fitted with hold hatch covers and coamings
Bulkheads on ships other than bulk carriers, oil tankers, chemical tankers, liquefied gas carriers and CSR ships (for these ships refer to B) and C): CLOSE-UP SURVEYS AND RELATED MEASUREMENTS)	“Selected bulkheads” means at least 50% of the bulkheads	Fig 5 for general cargo ships. It may also apply to other ship types (see [3.2.1])
Selected internal structure such as floors and longitudinals, transverse frames, web frames, deck beams, ‘tweendecks, girders (for all ship types other than CSR ships)	The internal structural items to be measured in each space internally surveyed are to be at least 20% within the cargo area and 10% outside the cargo area	Fig 6 for general cargo ships. It may also apply to other ship types (see [3.2.1])
Transverse section of deck plating outside line of cargo hatch openings (for bulk carriers, ore carriers, combination carriers and CSR single skin and double skin bulk carriers)	Two single points on each deck plate (to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion) between the ship sides and hatch coamings in the transverse section concerned	No figure
Transverse rings (1) in cargo and ballast tanks (for CSR oil tankers)	At least two points on each plate in a staggered pattern and two points on the corresponding flange where applicable. Minimum 4 points on the first plate below deck. Additional points in way of curved parts. At least one point on each of two stiffeners between stringers / longitudinal girders	Fig 16 for CSR oil tankers
One section of deck plating for the full beam of the ship within the cargo area (for oil tankers, chemical tankers and liquefied gas carriers, other than CSR ships)	Two single points on each deck plate (to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion) in the transverse section concerned	No figure
All deck plating and underdeck structure inside line of hatch openings between cargo hold hatches (for CSR single skin and double skin bulk carriers)	«All deck plating» means at least two points on each plate to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion. “Under deck structure”: at each short longitudinal girder: three points for web plating (fwd/middle/aft), single point for face plate, one point for web plating and one point for face plating of transverse beam in way. At each ends of transverse beams, one point for web plating and one point for face plating	Fig 10 for CSR single skin and double skin bulk carriers Extent of areas is shown in Ch 4, Sec 2, Fig 1 and Ch 4, Sec 2, Fig 4
B) CLOSE-UP SURVEYS AND RELATED MEASUREMENTS (oil tankers, chemical tankers, liquefied gas carriers and combination carriers)		
ITEM	INTERPRETATION	FIGURE
Web frame ring (for oil tankers and combination carriers other than CSR ships)	Refer to the definition given in Ch 4, Sec 3, Tab 1 “Adjacent structural members” means plating and stiffeners of deck, bottom, double bottom, sides and longitudinal bulkheads in the vicinity of the web frame ring	Extent of areas is shown as ⊙ in Ch 4, Sec 3, Fig 1 Locations of points are given in Fig 13
Transverse section (for chemical tankers and liquefied gas carriers)	Refer to the definitions given in Ch 4, Sec 4, Tab 1 and Ch 4, Sec 5, Tab 2 “Adjacent structural members” means plating and stiffeners of deck, bottom, double bottom, sides and longitudinal bulkheads in the vicinity of the web frame ring	No figure

Deck transverse (for all ships other than CSR ships)	This is the upper part of the web frame ring including the adjacent structural members (see meaning given above). For chemical tankers it may be fitted on deck, i.e. outside the tank	Extent of areas is shown as ② in Ch 4, Sec 3, Fig 1 Locations of points are given in Fig 13
Deck and bottom transverses (for oil tankers other than CSR ships)	Refer to the definition given in Ch 4, Sec 3, Tab 1	Extent of areas is shown as ② and ⑤ in Ch 4, Sec 3, Fig 1 Locations of points are given in Fig 13
Transverse bulkheads (for all ships other than CSR ships)	“Complete” means the whole bulkhead including stringers and stiffeners and adjacent structural members as defined above  “Lower part” means lower part of bulkhead up to 1/4 of ship’s depth or 2 metres above the lower stringer, whichever is the greater (stringers, stiffeners and adjacent structural members included)	Extent of areas is shown as ③ in Ch 4, Sec 3, Fig 1 Locations of points are given in Fig 14  Extent of areas is shown as ④ in Ch 4, Sec 3, Fig 1 Locations of points are given in Fig 14
Transverse bulkheads in cargo tanks (for CSR oil tankers)	At least two points on each plate. Minimum 4 points on the first plate below main deck At least one point on every third stiffener to be taken between each stringer At least two points on each plate of stringers and girders, and two points on the corresponding flange. Additional points in way of curved part Two points of each diaphragm plate of stools, if fitted.	Fig 17 for CSR oil tankers
Transverse bulkheads in ballast tanks (for CSR oil tankers)	At least 4 points on plates between stringers / longitudinal girders, or per plate if stringers/girders not fitted At least two points on each plate of stringers and girders, and two points on the corresponding flange. Additional points in way of curved part At least one point on two stiffeners between each stringer / longitudinal girder	Fig 18 for CSR oil tankers
Adjacent structural members (for CSR oil tankers)	On adjacent structural members one point per plate and one point on every third stiffener/longitudinal	No figure
All plating and internal structures (for chemical tankers and liquefied gas carriers)	Refer to the definitions given in Ch 4, Sec 4, Tab 1 and Ch 4, Sec 5, Tab 2	No figure
C) CLOSE-UP SURVEYS AND RELATED MEASUREMENTS (bulk carriers and ore carriers)		
ITEM	INTERPRETATION	FIGURE
Frames in cargo holds (for bulk carriers and ore carriers other than CSR ships)	25% of frames: one out of four frames should preferably be chosen throughout the cargo hold length on each side “Selected frames” means at least 3 frames on each side of cargo holds	Extent of areas is shown as ① in Ch 4, Sec 2, Fig 1 Locations of points are given in Fig 7
Selected side shell frames in cargo holds (for CSR single skin bulk carriers)	Includes side shell frame, upper and lower end attachments and adjacent shell plating 25% of frames: one out of four frames should preferably be chosen throughout the cargo hold length on each side 50% of frames: one out of two frames should preferably be chosen throughout the cargo hold length on each side «Selected frames» means at least 3 frames on each side of cargo holds	Fig 11 for CSR single skin bulk carriers Extent of areas is shown in Ch 4, Sec 2, Fig 1
Transverse frame in double skin tank (for CSR double skin bulk carriers)		Fig 2
Transverse bulkheads in cargo holds (for bulk carriers, ore carriers and CSR single skin and double skin bulk carriers)	Refer to the definition given in Ch 4, Sec 2, Tab 8 footnote (3) Two selected bulkheads: one is to be the bulkhead between the two foremost cargo holds and the second may be chosen in other positions (for CSR single skin and double skin bulk carriers)	Areas of measurements are shown in Ch 4, Sec 2, Fig 1 and Ch 4, Sec 2, Fig 4 Locations of points are given in Fig 8

<p>One transverse bulkhead in each cargo hold (for bulk carriers, ore carriers and CSR single skin and double skin bulk carriers)</p>	<p>This means that the close-up survey and related thickness measurements are to be performed on one side of the bulkhead; the side is to be chosen based on the outcome of the overall survey of both sides. In the event of doubt, the Surveyor may also require (possibly partial) close-up survey on the other side</p>	<p>Areas of measurements are shown in Ch 4, Sec 2, Fig 1 and Ch 4, Sec 2, Fig 4 Locations of points are given in Fig 8</p>
<p>Transverse bulkheads in one topside/side, hopper and double bottom ballast tank (for bulk carriers, ore carriers and CSR single skin and double skin bulk carriers)</p>	<p>Includes bulkhead and stiffening systems (for CSR single skin and double skin bulk carriers) The ballast tank is to be chosen based on the history of ballasting among those prone to have the most severe conditions</p>	<p>Locations of points are given in Ch 2, App 3</p>
<p>Transverse webs in ballast tanks (for bulk carriers, ore carriers and CSR single skin and double skin bulk carriers)</p>	<p>Either one of the representative tanks of each type (i.e. topside or hopper or side tank) is to be chosen in the forward part Includes web plating, face plates, stiffeners and associated plating and longitudinals (for CSR single skin and double skin bulk carriers) “Associated plating and longitudinals” means adjacent plating and longitudinals of deck, bottom, side shell, slope, hopper and longitudinal bulkhead, as applicable</p>	<p>Extent of areas is shown as © in Ch 4, Sec 2, Fig 1 and Ch 4, Sec 2, Fig 4 Locations of points are given in Fig 7 Locations of points are given in Fig 11 for CSR single skin bulk carriers and in Fig 12 for CSR double skin bulk carriers</p>
<p>Areas of deck plating inside line of hatch openings (for bulk carriers and ore carriers other than CSR ships)</p>	<p>“Selected” means at least a single point on one out of three plates, to be chosen on representative areas of average corrosion “All deck plating” means at least two points on each plate to be taken either at each 1/4 extremity of plate or at representative areas of average corrosion</p>	<p>Extent of areas is shown as © in Ch 4, Sec 2, Fig 1</p>
<p><b>(1)</b> Transverse rings means all transverse material appearing in a cross-section of the ship's hull, in way of a double bottom floor, vertical web and deck transverse (definition from the Common Structural Rules).</p>		

**Figure 1 : Transverse section of a general cargo ship**

Measurements are to be taken on both port and starboard sides of the selected transverse section

Figure 2 : Transverse section of bulk carriers

Single side bulk carriers

Double side bulk carriers

Measurements are to be taken on both port and starboard sides of the selected transverse section

Figure 3 : Transverse section of an oil tanker

Measurements are to be taken on both port and starboard sides of the selected transverse section

Figure 4 : Locations of measurements on hatch covers and coamings (valid for all ships fitted with hatch covers and coamings)

- (1) Three sections at  $L/4$ ,  $L/2$ ,  $3L/4$  of hatch cover length, including:
- one measurement of each hatch cover plate and skirt plate
  - measurements of adjacent beams and stiffeners
  - one measurement of coaming plates and coaming flange, each side
- (2) Measurements of both ends of hatch cover skirt plate, coaming plate and coaming flange
- (3) One measurement of one out of three hatch coaming brackets and bars, on both sides and both ends

Figure 5 : Locations of measurements on bulkheads of general cargo ships

Cargo hold bulkhead/watertight floor plating to be measured as per main view

One stiffener out of three to be measured as per view A - A

Figure 6 : Locations of measurements on selected internal structural elements of general cargo ships

Figure 7 : Locations of measurements on structural members in cargo holds and ballast tanks of bulk carriers

Figure 8 : Locations of measurements on cargo hold transverse bulkheads of bulk carriers (additional measurements to internal structure of upper and lower stools to be added, e.g. two points in the upper and two points in the lower stools to be indicated in section A-A)

Measurements to be taken in each shaded area as per views A - A and B - B

Figure 9 : Locations of measurements on transverse bulkheads of topside, hopper and double bottom tanks of bulk carriers (two additional measurements to internal structure of double bottom tank to be added at midspan)

Section A - A

Measurements to be taken in each vertical section as per view A - A

Figure 10 : Location of measurements on underdeck structure of CSR single skin and double skin bulk carriers

Figure 11 : Location of measurements on structural members in cargo holds and ballast tanks of CSR single skin bulk carriers

The gauging pattern for web plating is to be a three-point pattern for zones A, C and D, and a two-point pattern for zone B (see Figure). The gauging report is to reflect the average reading. The average reading is to be compared with the allowable thickness.

If the web plating has general corrosion, then this pattern is to be expanded to a five-point pattern.

Figure 12 : Location of measurements on structural members in ballast tanks of CSR double skin bulk carriers (topside or hopper or side tank)

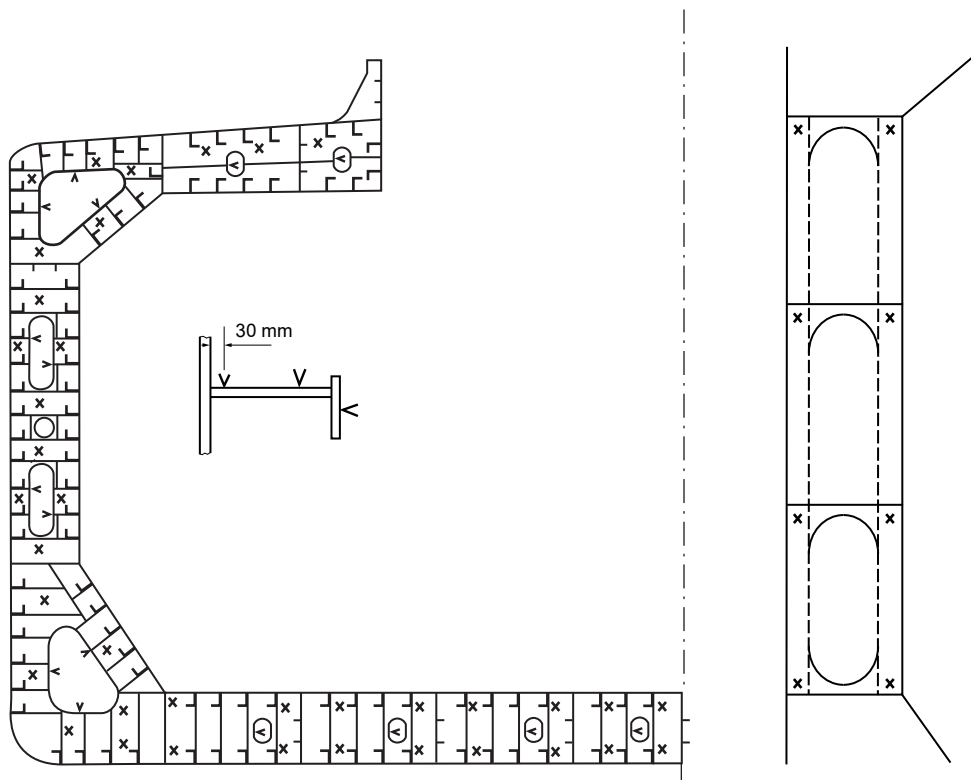

Figure 13 : Locations of measurements on web frame rings and longitudinal elements of oil tankers

Figure 14 : Locations of measurements on transverse bulkheads of oil tankers

(1) : Corrugated bulkhead

(2) : Plane bulkhead

Measurements are to be taken in a similar way on the centre tank bulkheads

Measurements are to cover the different thicknesses of strakes over the height of the bulkhead

Measurements are to be taken of the adjacent structural members

Figure 15 : Location of measurements on transverse section of CSR oil tankers

Figure 16 : Location of measurements on transverse rings in cargo and ballast tanks of CSR oil tankers

Figure 17 : Location of measurements on transverse bulkheads in cargo tanks of CSR oil tankers

Figure 18 : Location of measurements on transverse bulkheads in ballast tanks of CSR oil tankers

## 4 Acceptance criteria for thickness measurements

### 4.1 General

4.1.1 Acceptance criteria stipulate limits of wastage which are to be taken into account for reinforcements, repairs or renewals of steel structure.

Note 1: In any case, at the request of the Owner, the Society may perform a direct calculation based on the current measurements.

4.1.2 In cases where the ship has some structural elements with reduced wear margins (e.g. due to ship conversion, increase of draught), the minimum acceptable thickness for these elements is to be calculated with reference to the rule scantlings without taking account of any reduction originally agreed.

4.1.3 Decisions on steel renewals are taken by the attending Surveyor applying the criteria given in this Article and based on his judgment and the actual condition of the ship. Should advice be needed to support his decision, the Surveyor may refer to the relevant technical office of the Society.

### 4.2 Criteria

4.2.1 The acceptance criteria for the minimum thicknesses are divided into:

- criteria given in Tab 3 for ships not having the additional service feature **CSR**
- criteria given in [4.7] for ships having the additional service feature **CSR**
- criteria on hull supporting structure of shipboard fittings associated with towing and mooring, given in [4.8]
- criteria on ice strengthened structures for ships assigned with additional class notation for navigation in polar waters, given in [4.9]

4.2.2 Each measured structural item is to be checked against criteria given in [4.2.1], as far as applicable. When the criteria are not met, reinforcements, repairs and renewals are to be carried out as appropriate.

Table 3 : Criteria for ships not having the additional service feature **CSR**

	Ships contracted for construction before 1st July 2016	Ships contracted for construction on or after 1st July 2016 and before 1st July 2022		Ships contracted for construction on or after 1st July 2022
	All ships (1)	Ships assigned the service notation <b>containership</b>	Other ships (1)	All ships (1)
Cargo ships with L < 65m (2) Non-cargo ships with L < 90m	see [4.3], [4.4] and [4.6]	see [4.3] and [4.6]	see [4.3], [4.4] and [4.6]	see [4.3] and [4.6]
Cargo ships with L ≥ 65m Non-cargo ships with L ≥ 90m		see [4.5] and [4.6]		see [4.5] and [4.6]
<p><b>Note 1:</b> For the definition of cargo ships and non-cargo ships, reference is to be made to NR600, Ch 1, Sec 1 [2.1.3]</p> <p><b>Note 2:</b> For the definition of L, reference is made to Pt B, Ch 1, Sec 3, [2.1.1]</p> <p>(1) Ships having alternate light and heavy cargo loading conditions, or ships assigned the service notation <b>liquefied gas carrier</b>, are to comply with the requirements applicable to cargo ships with L ≥ 65m, irrespective of their length.</p> <p>(2) Except ships having alternate light and heavy cargo loading conditions, or ships assigned the service notation <b>liquefied gas carrier</b>.</p>				

### 4.3 Local and global strength criteria based on percentage of acceptable wastage

4.3.1 Local and global strength criteria are given for the following ship types:

- general cargo ships
- bulk carriers
- oil tankers.

These criteria are generally expressed for each structural item as a maximum percentage of acceptable wastage (W). When the maximum percentage of wastage is indicated, the minimum acceptable thickness ( $t_{\min}$ ) is that resulting from applying this percentage to the rule thickness ( $t_{\text{rule}}$ ), according to the following formula:

$$t_{\min} = \left(1 - \frac{W}{100}\right) t_{\text{rule}} - t_{\text{wc}}$$

Where  $t_{\text{wc}}$  is to be taken equal to:

- 0 in general
- 1,5 mm for the inner bottom plating when not protected by any continuous wooden ceiling, for ships contracted for construction on or after January 1<sup>st</sup> 2001 and assigned one of the following service notations:
  - **bulk carrier**
  - **bulk carrier ESP**, not assigned the additional service feature **CSR**
  - **ore carrier ESP**
  - **combination carrier/OBO ESP**
  - **combination carrier/OOC ESP**

However, when the rule thickness is not available, the as-built thickness can be used.

Only for criteria related to an item (see [4.3.4], item b), the Society may establish a list of renewal thicknesses tailored to the different structural items. In such a case these thicknesses are used in lieu of the minimum thicknesses calculated from the percentage of wastage.

These criteria may also be used for other ship types taking into consideration the equivalence or similarity of structural elements and their contribution to local and/or global strength.

4.3.2 For the evaluation of the ship longitudinal strength, it is a prerequisite that fillet welding between longitudinal members and deck, side and bottom plating is maintained effective so as to keep continuity of hull structures.

4.3.3 Each structural item to be assessed is illustrated in a typical transverse section (see Fig 19 for general cargo ships, Fig 20 for bulk carriers, Fig 21 for oil tankers).

These structural items are also listed in a table ( Tab 4 for general cargo ships, Tab 5 for bulk carriers, Tab 6 for oil tankers) grouped according to their position and contribution to the local or global strength of the ship.

4.3.4 Each structural item is to be assessed according to four different criteria which vary with regard to the domain under which it is considered, namely:

- a) an isolated area, which is meant as a part of a single structural item. This criterion takes into consideration very local aspects such as grooving of a plate or web, or local severe corrosion; however, it is not to be used for pitting for which separate criteria are considered (see [4.6])
- b) an item, which is meant as an individual element such as a plate, a stiffener, a web, etc. This criterion takes into consideration the average condition of the item, which is assessed by determining its average thickness using the various measurements taken on the same item
- c) a group of items, which is meant as a set of elements of the same nature (plates, longitudinals, girders) contributing either to the longitudinal global strength of the ship in a given zone or to the global strength of other primary transverse elements not contributing to the ship longitudinal strength, e. g. bulkheads, hatch covers, web frames
- d) a zone, which is meant as all and only longitudinal elements contributing to the longitudinal strength of the ship; in this regard, the three main zones are defined as deck zone, neutral axis zone and bottom zone. This criterion takes into consideration the average condition of all groups of items belonging to the same zone.

**4.3.5** The assessment of the thickness measurements is to be performed using the values given in the tables for each structural element with regard to the four criteria defined above, in the following order:

- assessment of isolated areas (column 1 in the tables). If the criterion is not met, the wasted part of the item is to be dealt with as necessary.
- assessment of items (column 2 in the tables). If the criterion is not met, the item is to be dealt with as necessary in the measured areas as far as the average condition of the item concerned is satisfactory. In cases where some items are renewed, the average thicknesses of these items to be considered in the next step are the new thicknesses.
- assessment of groups of items (column 3 in the tables). If the criterion is not met, a sufficient number of elements are to be renewed in order to obtain an increased average thickness satisfying the considered criterion of the group (generally the elements to be renewed are those most wasted). As an example, for the assessment of the group “deck plates” all deck plates are measured and an average thickness of each of them is estimated. Then the average of all these values is to satisfy the criteria given for this group.
- assessment of zones (column 4 in the tables). In principle, the criterion of the zone is met when all groups of items belonging to the zone meet their own criteria (see c) above). However, a greater diminution than those given in column 3 may be accepted for one group of items if, considering the other groups of items belonging to the same zone, the overall diminution of the zone does not exceed the criterion given for it in column 4.

Example: The deck zone consists of two groups of items:

- deck plating, which has an average diminution of 12% (criterion 10%)
- deck longitudinals, which has an average diminution of 4% (criterion 10%).

Even though the deck plating group exceeds its acceptance criterion, the average diminution of the zone, which can be very roughly estimated at 8%, is acceptable and thus the deck plating group can be accepted as it is.

Note 1: This criterion applicable to the zones is based on the general rule that the current hull girder section modulus is not to be less than 90% of the rule section modulus within 0,4L amidships. When the zone criterion is used, the assessment is made on the basis of the original modulus instead of the rule modulus. At the request of the Owner, a direct calculation using the ship’s current thicknesses may be performed by the Society in order to accept greater diminutions than those given for this criterion.

**4.3.6** These criteria take into consideration two main aspects:

- the overall strength of the hull girder
- the local strength and integrity of the hull structure, such as hatch covers, bulkheads, etc.

As a rule, they are applicable to the structure within the cargo area of ships having a length greater than 90 metres. However, they may also be used for smaller ships and for structure outside the cargo area according to the following principles:

- for ships having a length less than 90 metres, the percentages of acceptable wastage given in the tables can be increased by 5 (%) (e.g. 15% instead of 10%, etc.), except for those of deck and bottom zones
- for structure outside the cargo area, the same 5 (%) increase can be applied,

on the understanding, however, that both conditions cannot be applied at the same time.

**Figure 19 : General cargo ship: layout of items to be assessed**

**Table 4 : Local and global acceptance criteria for general cargo ships (given in % of wastage)**

Group of items	Description of items	1 Isolated area	2 Item	3 Group	4 Zone
<b>ITEMS CONTRIBUTING TO THE LONGITUDINAL STRENGTH (TRANSVERSE SECTION)</b>					
<b>DECK ZONE (1)</b>					
		–	–	–	10
1	Hatch coaming	–	–	10	–

Group of items	Description of items	1 Isolated area	2 Item	3 Group	4 Zone
22	Forward and aft peak bulkheads plating	30	20	15	–
	stiffener web	30	20	–	–
	stiffener flange	25	15	–	–

- (1) Each zone is to be evaluated separately.
- (2) If continuous, to be included in item 1.
- (3) For deep tank bulkheads, the values “average of item” and “average of group” are to be increased by 5 (%).
- (4) For cargo ships constructed (i.e. keel laid) from 1st January 2012:
- steel renewal is required where the gauged thickness is less than  $(t_{net} + 0,5)$  mm for: single skin hatch covers, plating of double skin hatch covers, and coaming structures the corrosion additions  $t_c$  of which are provided in Pt B, Ch 8, Sec 7, Tab 1 of the July 2021 edition of the Rules (for ships contracted for construction on or after 1st July 2016).
  - where the gauged thickness is within the range  $(t_{net} + 0,5)$  mm and  $(t_{net} + 1,0)$  mm, coating (applied in accordance with the coating manufacturer’s requirements) or annual gauging may be adopted as an alternative to steel renewal. Coating is to be maintained in GOOD condition. If  $t_{net}$  is not available, the as-built thickness minus the total corrosion addition can be used.
  - for the internal structures of double skin hatch covers, thickness gauging is required when hatch cover top or bottom plating renewal is to be carried out or when this is deemed necessary, at the discretion of the Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required when the gauged thickness is less than  $t_{net}$ . If  $t_{net}$  is not available, the as-built thickness minus the total corrosion addition can be used.
  - for corrosion addition  $t_c = 1,0$  mm the thickness for steel renewal is  $t_{net}$  and the thickness for coating or annual gauging is when gauged thickness is between  $t_{net}$  and  $(t_{net} + 0,5)$  mm.
  - for coaming structures, the corrosion addition  $t_c$  of which are not provided in Pt B, Ch 8, Sec 7, Tab 1 of the July 2021 edition of the Rules, steel renewal and coating or annual gauging are to be in accordance with the requirements of the Society (for ships contracted for construction on or after 1st July 2016).
- For cargo ships constructed (i.e. keel laid) from 1st January 2005:
- for hatch covers in way of cellular cargo holds intended for containers (plating, stiffeners and internals), steel renewal is required where the gauged thickness is less than  $t_{net}$ . Where the gauged thickness is within the range  $t_{net}$  and  $(t_{net} + 0,5)$  mm, coating (applied in accordance with the coating manufacturer’s requirements) or annual gauging may be adopted as an alternative to steel renewal. Coating is to be maintained in good condition. If  $t_{net}$  is not available, the as-built thickness minus the total corrosion addition can be used.
- (5) For ships contracted for construction on or after 1 July 2006, with transverse vertically corrugated watertight bulkheads, of length greater than or equal to 150 m, intended for the carriage of bulk cargoes having dry bulk cargo density 1,0 t/m<sup>3</sup> or above where the unloading system maintains the watertightness during seagoing operations: the vertically corrugated transverse bulkheads are to be repaired by steel renewal where the gauged thickness is less than  $(t_{net} + 0,5)$  mm, where  $t_{net}$  is the thickness obtained by applying the strength criteria given in Pt D, Ch 4, Sec 3, [6.1] of the July 2021 edition of the Rules. However, where the gauged thickness is within the range  $(t_{net} + 0,5)$  mm and  $(t_{net} + 1,0)$  mm, coating (applied in accordance with the coating Manufacturer’s requirements) or annual gauging may be adopted as an alternative to steel renewal.

	web	25	20	–	–
	flange	20	15	–	–

Group of items	Description of items	1 Isolated area	2 Item	3 Group	4 Zone
20	Floors plating	25	15	–	–
21	Forward and aft peak bulkheads plating	25	20	15	–
	stiffener web	25	20	–	–
	stiffener flange	20	15	–	–

- (1) Each zone is to be evaluated separately.
- (2) If continuous, to be included in item 1.
- (3) For vertically corrugated transverse bulkheads in cargo holds:
  - For ships indicated in Ch 6, Sec 2, [1.1] which are to comply with the retroactive requirements according to the schedule given in Ch 6, Sec 2, [1.2], the bulkhead between the two foremost cargo holds is to be assessed based on the criteria given in Ch 6, Sec 2, [1.3].
  - For ships assigned with the notation bulk carrier or self-unloading bulk carrier, contracted for construction on or after 1 July 1998, with transverse vertically corrugated watertight bulkheads, of length greater than or equal to 150 m, intended for the carriage of bulk cargoes having dry bulk cargo density 1,0 t/m<sup>3</sup> or above where the unloading system maintains the watertightness during seagoing operations: all bulkheads are to be repaired by steel renewal where the gauged thickness is less than  $(t_{net} + 0,5)$  mm, where  $t_{net}$  is the thickness obtained by applying the strength criteria given in Pt D, Ch 4, Sec 3, [6.1] of the July 2021 edition of the Rules. However, where the gauged thickness is within the range  $(t_{net} + 0,5)$  mm and  $(t_{net} + 1,0)$  mm, coating (applied in accordance with the coating Manufacturer’s requirements) or annual gauging may be adopted as an alternative to steel renewal.
- (4) Steel renewal criteria or other measures (reinforcement or coating) to be taken for the side shell frames and brackets in single side skin ships with service notation **bulk carrier ESP** not built in accordance with Part II, Chapter 08, Section 8-03 of the 1<sup>st</sup> April 1998 edition of the Rules or subsequent editions are given in Ch 6, Sec 2, [5] and Ch 6, App 1, [5]. However, for such ships which are to comply with Ch 6, Sec 2, [5], the thickness measurements of flanges and side shell plating not covered in Ch 6, Sec 2, [5.3], as well as the thickness measurements of additional intermediate frames fitted for reinforcement in order to comply with an ice class notation (ice strengthening structure), are to be carried out in accordance with Article [3] and the measured thicknesses assessed against the criteria indicated in Article [4] and the present Table.
- (5) For ships which are assigned one of the service notations **bulk carrier ESP**, **bulk carrier BC-A ESP**, **bulk carrier BC-B ESP** or **bulk carrier BC-C ESP**, contracted for construction on or after the 1<sup>st</sup> July 1998 and for hatch covers on exposed decks:
  - for single skin hatch covers and for the plating of double skin hatch covers, steel renewal is required where the gauged thickness is less than  $(t_{net} + 0,5)$  mm. Where the gauged thickness is within the range  $(t_{net} + 0,5)$  mm and  $(t_{net} + 1,0)$  mm, coating (applied in accordance with the coating manufacturer’s requirements) or annual gauging may be adopted as an alternative to steel renewal. If  $t_{net}$  is not available, the as-built thickness, minus the total corrosion addition, can be used.
  - for the internal structures of double skin hatch covers, thickness gauging is required when plating renewal is to be carried out or when this is deemed necessary, at the discretion of the Society’s Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is less than  $t_{net}$ . If  $t_{net}$  is not available, the as-built thickness, minus the total corrosion addition, can be used.
- (6) For ships which are assigned one of the service notations **bulk carrier BC-A ESP**, **bulk carrier BC-B ESP**, **bulk carrier BC-C ESP**, **ore carrier ESP**, **combination carrier/OBO ESP** or **combination carrier/OOC ESP**, contracted for construction on or after 1 January 2004 and for all cargo hatch covers and hatch forward and side coamings on exposed decks in position 1 as defined in ILLC:
  - for single skin hatch covers and for the plating of double skin hatch covers, steel renewal is required where the gauged thickness is less than  $(t_{net} + 0,5)$  mm. Where the gauged thickness is within the range  $(t_{net} + 0,5)$  mm and  $(t_{net} + 1,0)$  mm, coating (applied in accordance with the coating manufacturer’s requirements) or annual gauging may be adopted as an alternative to steel renewal. Coating is to be maintained in good condition. If  $t_{net}$  is not available, the as-built thickness, minus the total corrosion addition, can be used.
  - for the internal structures of double skin hatch covers, thickness gauging is required when plating renewal is to be carried out or when this is deemed necessary, at the discretion of the Society’s Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is less than  $t_{net}$ . If  $t_{net}$  is not available, the as-built thickness, minus the total corrosion addition, can be used.
  - for hatch coamings, steel renewal is required where the gauged thickness is less than  $(t_{net} + 0,5)$  mm. Where the gauged thickness is within the range  $(t_{net} + 0,5)$  mm and  $(t_{net} + 1,00)$  mm, coating (applied in accordance with the coating manufacturer’s requirements) or annual gauging may be adopted as an alternative to steel renewal. Coating is to be maintained in good condition. If  $t_{net}$  is not available, the as-built thickness, minus the total corrosion addition, can be used.

Figure 21 : Oil tanker: layout of items to be assessed

Table 6 : Local and global acceptance criteria for oil tankers (given in % of wastage)

Group of items	Description of items	1 Isolated area	2 Item	3 Group	4 Zone
<b>ITEMS CONTRIBUTING TO THE LONGITUDINAL STRENGTH (TRANSVERSE SECTION)</b>					
<b>DECK ZONE (1)</b>					
1	Deck plating, deck stringer, sheer strake and longitudinal bulkhead upper strake (2)	25	20	10	–

	stiffener web stiffener flange	30 25	20 15	– –	– –

(1) Each zone is to be evaluated separately.  
(2) For double hull oil tankers, the structural elements of the inner skin (plating, longitudinals, girders, bulkheads) are to be included in the corresponding elements of the outer skin.  
(3) Including swash bulkheads, forward and aft peak bulkheads.

#### 4.4 Buckling strength criterion

4.4.1 This criterion is applicable to ships having a length greater than 120 metres.

The structural items contributing to the longitudinal strength of the ship, such as deck and bottom plating, deck and bottom girders, etc., are to be assessed with regard to their buckling strength, as deemed necessary by the Surveyor. In such a case, the values shown in Tab 7 are not to be exceeded.

Note 1: The minimum thickness will be specially considered for ships built with excess hull girder section modulus.

**Table 7 : Buckling strength criterion**

Items		Ratio	Material ( $R_{eH}$ )		
			235	315	355 and 390
Bottom and deck plates		$s / t$	56,0	51,0	49,0
Longitudinals	flat bar web	$h_w / t_w$	20,0	18,0	17,5
Flanged longitudinals / girders	web	$h_w / t_w$	56,0	51,0	49,0
	symmetrical flange	$b_f / t_f$	34,0	30,0	29,0
	asymmetrical flange	$b_f / t_f$	17,0	15,0	14,5

**Note 1:** Symbols:  
 $R_{eH}$  : Minimum yield stress of the material, in N/mm<sup>2</sup>;                       $t_w$  : Web thickness, in mm;  
 $s$  : Longitudinal spacing, in mm;     $b_f$  : Flange breadth, in mm;  
 $t$  : Actual plate thickness, in mm;     $t_f$  : Flange thickness, in mm.  
 $h_w$  : Web height, in mm;

## 4.5 Acceptance criteria based on net scantling approach

### 4.5.1 General

The acceptance criteria for allowable thickness diminution of ship hull structure are given here after.

Symbols:

- $t_{as-built}$  : As built thickness, in mm.  
 $t_c$  : Corrosion addition, in mm, as defined in Pt B, Ch 4, Sec 2.  
 $t_{res}$  : Reserve thickness, taken equal to 0,5 mm.  
 $t_{vol-add}$  : Thickness for voluntary addition, in mm.  
 $t_m$  : Measured thickness, in mm, on one item, i.e. average thickness on one item using the various measurements taken on this same item during periodical ship's in service surveys.

### 4.5.2 Definitions

a) Deck zone

The deck zone includes all the following items contributing to the hull girder strength:

- strength deck plating
- longitudinal hatch coaming
- sheer strake
- side shell plating
- inner hull and other plane longitudinal bulkhead plating, if any
- topside tank sloped plating, including horizontal and vertical strakes, if any
- longitudinal upper stool, if any
- longitudinal stiffeners, girders and stringers connected to the above mentioned plating.

b) Bottom zone

The bottom zone includes all the following items contributing to the hull girder strength:

- keel plate
- bottom plating
- bilge plating
- bottom girders
- inner bottom plating
- side shell plating
- plane longitudinal bulkheads lower strake
- hopper tank sloping plating, and horizontal plating, if any
- longitudinal lower stool, if any
- longitudinal stiffeners connected to the above mentioned plating.

c) Neutral axis zone

The neutral axis zone includes the following items between the deck zone and the bottom zone, as for example:

- side shell plating
- inner hull plating and longitudinal bulkhead, if any
- double hull girder.

### 4.5.3 Local corrosion

a) Renewal thickness of local structural elements

Local structural elements include local supporting members and primary supporting members.

Steel renewal is required if the measured thickness,  $t_m$  in mm, is less than the renewal thickness,  $t_{ren}$  defined as:

$$t_{ren} = t_{as-built} - t_c - t_{vol-add}$$

b) Renewal area

Areas which need to be renewed based on the renewal criteria in [4.5.3]a) are to be repaired with inserted material which is to have the same or greater grade and yield stress as the original, and to have a thickness,  $t_{repair}$  in mm, not less than:

$$t_{repair} = t_{as-built} - t_{vol-add}$$

c) Alternative solutions

When there is a substantial corrosion as defined in Ch 2, Sec 2, [2.2.7], coating applied in accordance with the coating manufacturer's requirements or annual gauging may be adopted as an alternative to the steel renewal. The coating is to be maintained in good condition.

**4.5.4 Global corrosion**

a) Application

The longitudinal strength of the ship is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during Class Renewal Surveys, for ships over 10 years of age.

b) Renewal criteria

Hull girder strength criteria are given as detailed below:

- For deck and bottom zones:

The current hull girder section modulus at deck and bottom determined with the thickness measurements are not to be less than the section modulus calculated according to Pt B, Ch 6, Sec 1 with the gross offered thickness minus  $0,5 t_c$ .

Alternatively, the current sectional areas of the bottom zone and of the deck zone which are the sum of the measured item areas of the considered zones are not to be less than the sectional area of the corresponding zones determined with the gross offered thickness minus  $0,5 t_c$ .

- For neutral axis zone:

The current sectional area of the neutral axis zone, which is the sum of the measured plating areas of this zone, is not to be less than the sectional area of the neutral axis zone calculated with the gross offered thickness minus  $0,5 t_c$ .

If the actual reduction of the gross offered thickness of all items, of a given transverse section which contribute to the hull girder strength is less than  $0,5 t_c$  for the deck, bottom and neutral axis zones, the hull girder strength criteria of this transverse section is satisfied and there is no need to perform calculation of the zone areas with measured thicknesses.

The gross offered thickness is defined in Pt B, Ch 4, Sec 2.

**4.6 Pitting**

**4.6.1** The maximum acceptable depth for isolated pits is 35% of the as-built thickness.

**4.6.2** For areas with different pitting intensity, the intensity diagrams shown in Fig 22 are to be used to identify the percentage of affected areas.

For areas having a pitting intensity of 50% or more, the maximum average depth of pits is 20% of the as-built thickness. For intermediate values between isolated pits and 50% of affected area, the interpolation between 35% and 20% is made according to Tab 8.

**4.6.3** In addition, for ships contracted for construction before 1st July 2022, the thickness outside the pits in the area considered is to be assessed according to [4.3] and [4.4].

Note 1: Application of filler material (plastic or epoxy compounds) is recommended as a means to stop or reduce the corrosion process, but it is not considered an acceptable repair for pitting exceeding the maximum allowable wastage limits. Welding repairs may be accepted when performed in accordance with procedures agreed with the society.

**Table 8 : Pitting intensity and corresponding maximum average depth of pitting**

Pitting Intensity, (%)	Maximum average pitting depth, (% of the as-built thickness)
Isolated	35,0
5	33,5
10	32,0
15	30,5
20	29,0
25	27,5
30	26,0
40	23,0
50	20,0

**4.7 Acceptance criteria for CSR ships**

**4.7.1 General**

For ships built under the Common Structural Rules, the acceptance criteria are according to the following rules:

- Chapter 13, “Ships in Operation, Renewal Criteria”, of NR522 CSR for Bulk Carriers
- Section 12, “Ship in Operation Renewal Criteria”, of NR523 CSR for Double Hull Oil Tankers,

and as specified in [4.7.2], [4.7.3], [4.7.4] and [4.7.5].

For ships built under the Common Structural Rules and complying with the requirements of Rule Note NR606 Common Structural Rules for Bulk Carriers and Oil Tankers, the acceptance criteria are to be in accordance with Part 1, Chapter 13, “Ship in Operation - Renewal Criteria”, of this NR606.

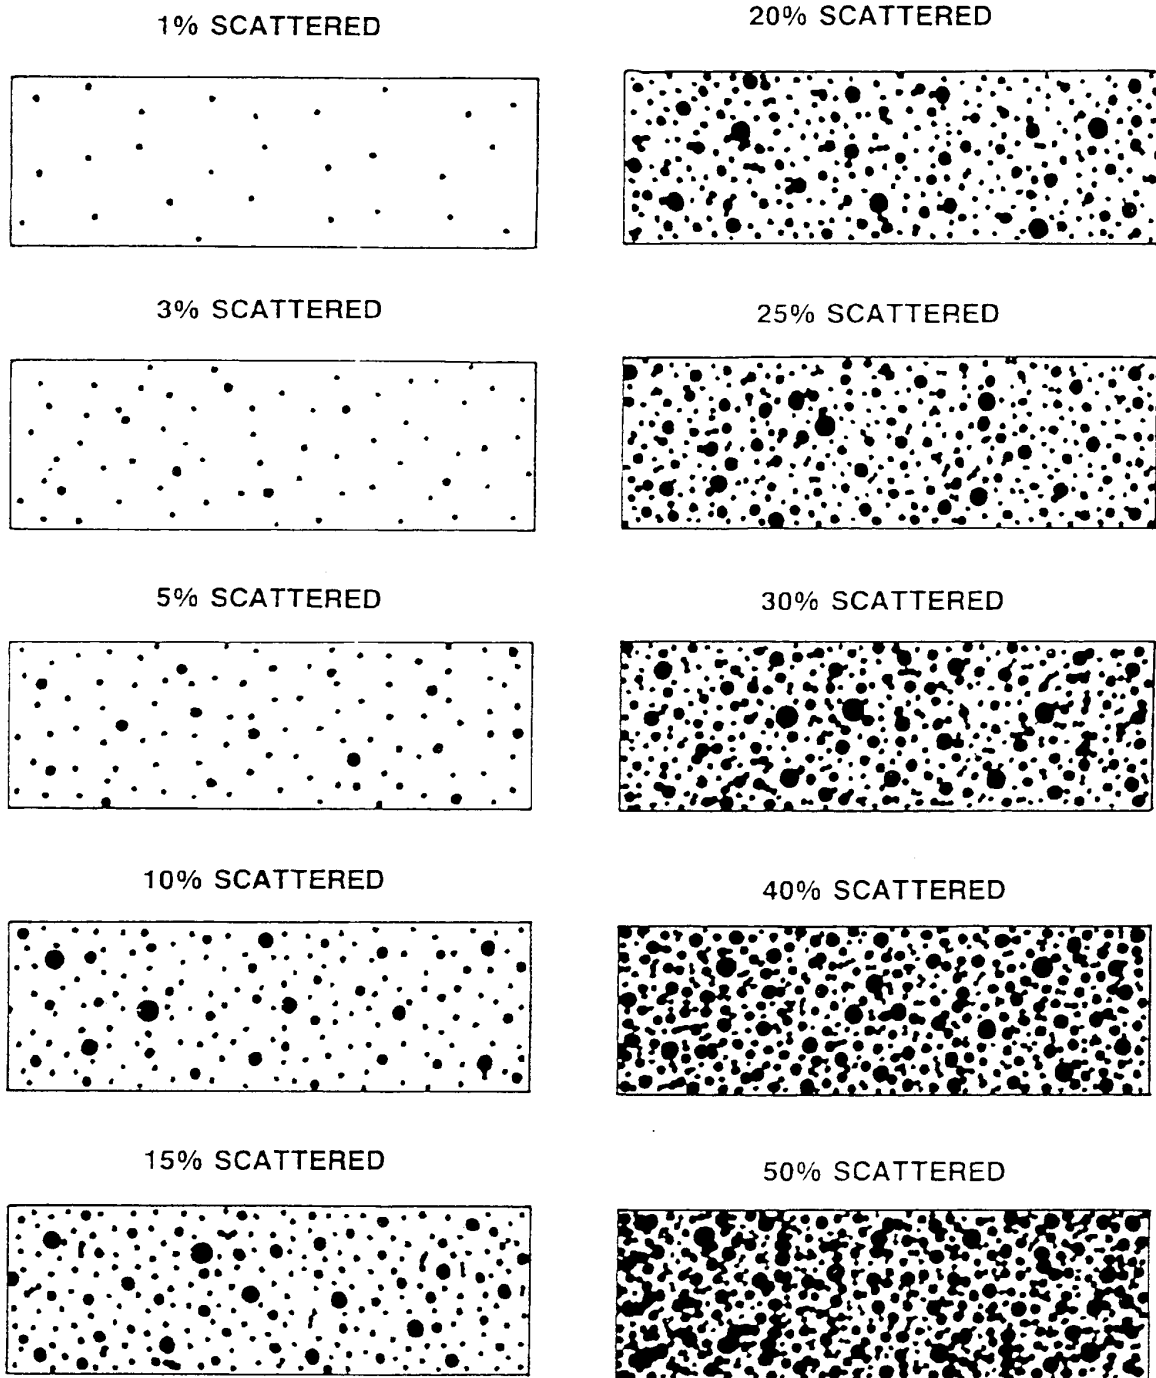

**4.7.2 Pitting corrosion: side structures (CSR bulk carriers)**

If pitting intensity, in an area where coating is required according to NR522 CSR for Bulk Carriers Ch 3, Sec 5, or NR606 CSR for Bulk Carriers and Oil Tankers Part 1, Ch 3, Sec 4, as applicable, is higher than 15% (see Fig 22), thickness measurements are to be performed to check the extent of pitting corrosion. The 15% is based on pitting or grooving on only one side of a plate. In cases where pitting is exceeding 15%, as defined above, an area of 300 mm or more, at the most pitted part of the plate, is to be cleaned to bare metal and the thickness is to be measured in way of the five deepest pits within the cleaned area. The least thickness measured in way of any of these pits is to be taken as the thickness to be recorded. The minimum remaining thickness in pits, grooves or other local areas is to be greater than the following values:

- for CSR single and double skin bulk carriers: 70% of the as-built thickness, in the side shell, hopper tank and topside tank plating attached to the each side frame, over a width up to 30 mm on either side of it
- for CSR single skin bulk carriers: 75% of the as-built thickness, in the frame and end bracket webs and flanges,

without being greater than the renewal thickness  $t_{ren}$  as defined in [4.7.3].

**Figure 22 : Pitting intensity diagrams (from 1% to 50% intensity)**

**4.7.3 Pitting corrosion: other structures (CSR bulk carriers and CSR oil tankers)**

For plates with pitting intensity less than 20% (see Fig 22), the measured thickness  $t_m$ , in mm, of any individual measurement is to meet the lesser of the following criteria:

$$t_m \geq 0,7 (t_{as-built} - t_{vol\ add})$$

$$t_m \geq t_{ren} - 1,0$$

where:

$t_{as-built}$  : As-built thickness of the member, in mm

$t_{vol\ add}$  : Voluntary thickness addition, namely thickness, in mm, voluntarily added as the Owner’s extra margin for corrosion wastage in addition to  $t_c$

$t_{ren}$  : Renewal thickness, namely minimum allowable thickness, in mm, below which renewal of structural members is to be carried out (see also NR523 CSR for Double Hull Oil Tankers, Section 12) or NR606 CSR for Bulk Carriers and Oil Tankers, Part 1, Chapter 13, as applicable)

$t_c$  : Total corrosion addition, in mm, defined in NR522 CSR for Bulk Carriers, Ch 3, Sec 3 or in NR606 CSR for Bulk Carriers and Oil Tankers, Pt 1, Ch 3, Sec 3, as applicable

$t_m$  : Measured thickness, in mm, on one item, i.e. average thickness on one item using the various measurements taken on this same item during periodical ship’s in service surveys.

The average thickness across any cross-section in the plating is not to be less than the renewal thickness for general corrosion given in NR522 CSR for Bulk Carriers, Chapter 13 or in NR523 CSR for Double Hull Oil Tankers, Section 12 or in NR606 CSR for Bulk Carriers and Oil Tankers, Part 1, Chapter 13, as applicable.

**4.7.4 Edge corrosion of CSR ships**

Provided that the overall corroded height of the edge corrosion of the flange, or web in the case of flat bar stiffeners, is less than 25% of the stiffener flange breadth or web height, as applicable (see Fig 23), the measured thickness  $t_m$ , in mm, is to meet the lesser of the following criteria:

$$t_m \geq 0,7 (t_{as-built} - t_{vol\ add})$$

$$t_m \geq t_{ren} - 1,0$$

where:

$t_{as-built}$ ,  $t_{vol\ add}$ ,  $t_{ren}$  : As defined in [4.7.3].

The average measured thickness  $t_m$  across the breadth or height of the stiffener is not to be less than the one defined in NR522 CSR for Bulk Carriers, Chapter 13 or in NR523 CSR for Double Hull Oil Tankers, Section 12 or in NR606 CSR for Bulk Carriers and Oil Tankers, Part 1, Chapter 13, as applicable.

Plate edges at openings for manholes, lightening holes, etc... may be below the minimum thickness given in NR522 CSR for Bulk Carriers, Chapter 13 or in NR523 CSR for Double Hull Oil Tankers, Section 12, or in NR606 CSR for Bulk Carriers and Oil Tankers, Part 1, Chapter 13, as applicable, provided that:

- a) The maximum extent of the reduced plate thickness, below the minimum given in NR522 CSR for Bulk Carriers, Chapter 13 or in NR523 CSR for Double Hull Oil Tankers, Section 12 or in NR606 CSR for Bulk Carriers and Oil Tankers, Part 1, Chapter 13, as applicable, from the opening edge is not more than 20% of the smallest dimension of the opening and does not exceed 100 mm.
- b) rough or uneven edges may be cropped-back provided that the maximum dimension of the opening is not increased by more than 10% and the remaining thickness of the new edge is not less than  $t_{ren} - 1$  mm.

**Figure 23 : Edge corrosion**

**4.7.5 Acceptance criteria for grooving corrosion of CSR ships**

a) Where the groove breadth is a maximum of 15% of the web height but not more than 30 mm (see Fig 24), the measured thickness  $t_m$ , in mm, in the grooved area is to meet the lesser of the following criteria:

$$t_m \geq 0,75 (t_{as-built} - t_{vol\ add})$$

$$t_m \geq t_{ren} - 0,5$$

but is not to be less than:  $t_m = 6$  mm,

where:

$t_{as-built}$ ,  $t_{vol\ add}$ ,  $t_{ren}$ : As defined in [4.7.3].

b) Structural members with areas of grooving greater than those in item a) are to be assessed, based on the criteria for general corrosion as defined in NR522 CSR for Bulk Carriers, Chapter 13 or in NR523 CSR for Double Hull Oil Tankers, Section 12 or in NR606 CSR for Bulk Carriers and Oil Tankers, Part 1, Chapter 13, as applicable, using the average measured thickness across the plating/stiffener.

**Figure 24 : Grooving corrosion**

**4.8 Hull supporting structure of shipboard fittings associated with towing and mooring**

**4.8.1** For ships contracted for construction on or after the 1<sup>st</sup> January 2007, the allowable wastage of the hull supporting structure of shipboard fittings associated with towing and mooring is not to exceed:

- the total corrosion addition defined in NR522 or NR523 for ships covered by the Common Structural Rules for Bulk Carriers or the Common Structural Rules for Double Hull Oil Tankers, or
- 2,0 mm for other ships.

**4.9 Ice strengthened structures for ships assigned with additional class notation for navigation in polar waters**

**4.9.1** For ships assigned with one of the additional class notations **POLAR CLASS** as defined in Ch 1, Sec 2, [6.11], steel renewal for ice strengthened structures as defined in NR527 is required when the gauged thickness is less than  $t_{net} + 0,5$  mm.

# Appendix 4 Condition Monitoring and Condition Based Maintenance

## 1 General

### 1.1 Application

**1.1.1** These requirements apply to the approved Condition Monitoring and Condition Based Maintenance schemes where the condition monitoring results are used to influence the scope and/or frequency of Class survey.

**1.1.2** This scheme may be applied to components and systems covered by continuous survey system for machinery (CSM), and other components and systems as requested by the owner. The extent of Condition Based Maintenance and associated monitoring equipment to be included in the maintenance scheme is decided by the Owner.

**1.1.3** These requirements can be applied only to vessels operating on approved PMS survey scheme.

**1.1.4** The scheme may be applied to any individual items and systems. Any items not covered by the scheme are to be surveyed and credited in accordance with the requirements of Part A, Chapter 3, Part A, Chapter 4 and Part A, Chapter 5 as applicable.

**1.1.5** Ships complying with the requirements of this Appendix are granted one of the notations **CBM** or **[CBM]** as defined in Ch 1, Sec 2, [4.16.14].

### 1.2 Definitions

**1.2.1** The following standard terms are defined in ISO 13372:2012.

#### 1.2.2 Condition monitoring

Acquisition and processing of information and data that indicate the state of a machine over time. The machine state deteriorates if faults or failures occur.

#### 1.2.3 Diagnostic

Examination of symptoms and syndromes to determine the nature of faults or failures.

#### 1.2.4 Condition based maintenance

Maintenance performed as governed by condition monitoring programmes.

### 1.3 Condition monitoring (CM)

**1.3.1** Where an approved condition monitoring system is fitted, credit for survey may be based on acceptable condition monitoring results. The condition monitoring results are to be reviewed during the annual audit.

**1.3.2** Limiting parameters are to be based on the Original Equipment Manufacturers guidelines (OEM), or a recognised international standard.

**1.3.3** The condition monitoring system is to provide an equivalent or greater degree of confidence in the condition of the machinery to traditional survey techniques.

**1.3.4** The condition monitoring system is to be approved in accordance with the Society's procedures.

**1.3.5** A condition monitoring system may be used to provide a greater understanding of equipment condition, and a condition based maintenance scheme may be used to obtain maintenance efficiency. Class approval is required where owners wish to change the survey cycle based on CM/CBM.

**1.3.6** Software systems can use complex algorithms, machine learning and knowledge of global equipment populations/defect data in order to identify acceptability for continued service or the requirement for maintenance. These systems may be independent of the OEM recommended maintenance and condition monitoring suggested limits. Approval of this type of software is to be based on OEM recommendations, industry standards and Society experience.

**1.3.7** The Society retains the right to test or open-up the machinery, irrespective of the CM results, if deemed necessary by Surveyor during annual and renewal audits.

## **1.4 Condition based maintenance (CBM)**

**1.4.1** Where an owner wishes to base their equipment maintenance on a CBM approach, this is to meet the requirements of the ISM Code.

**1.4.2** Where an approved planned maintenance and CBM scheme is in operation, the CSM and other survey intervals may be extended based on OEM maintenance recommendations and acceptable condition monitoring results.

**1.4.3** Limiting parameters (alarms and warnings) are to be based on the OEM guidelines, or a recognised international standard.

**1.4.4** The CBM scheme is to provide an equivalent or greater degree of confidence in the condition of the machinery to traditional maintenance techniques.

**1.4.5** The scheme is to be approved in accordance with the Society's procedures.

**1.4.6** Software systems can use complex algorithms, machine learning and knowledge of global equipment populations/defect data in order to identify acceptability for continued service or the requirement for maintenance. These systems may be independent of the OEM recommended maintenance and condition monitoring suggested limits. Approval of this type of software is to be based on OEM recommendations, industry standards and Society experience. In that case, written agreement from the OEM is to be provided to the Society.

## **2 Procedures and conditions for approval of CM and CBM**

### **2.1 Onboard responsibility**

**2.1.1** The Chief Engineer is to be the responsible person on board in charge of the CM and CBM.

**2.1.2** Documentation on the overhaul of items covered by CM and CBM schemes are to be reported by the Chief Engineer.

**2.1.3** Access to computerized systems for updating of the maintenance documentation and maintenance program is only to be permitted by the Chief Engineer or other authorized person.

**2.1.4** All personnel involved in CM and CBM is to be appropriately qualified.

Note 1: CM does not replace routine surveillance or the Chief Engineer's responsibility for taking decisions in accordance with his judgement.

### **2.2 Equipment and systems requirements**

**2.2.1** CM equipment and systems are to be approved in accordance with the Rule Note NR674 Condition Monitoring Systems.

**2.2.2** The CM/CBM scheme and its extent, are to be approved by the Society.

**2.2.3** The CBM scheme is to be capable of producing a condition report, and maintenance recommendations.

**2.2.4** A system is to be provided to identify where limiting parameters (alarms and warnings) are modified during the operation of the scheme.

**2.2.5** Where CM and CBM schemes use remote monitoring and diagnosis (i.e. data is transferred from the vessel and analysed remotely), the system is to meet the applicable standards related to the assignment of the additional class notation **CYBER SECURE** from Rule Note NR659, Rules on Cyber Security for the Classification of Marine Units. The system is to be capable of continued onboard operation in the event of loss of the communication function.

**2.2.6** CBM schemes are to identify defects and unexpected failures that were not prevented by the CM system.

**2.2.7** Systems are to include a method of backing up data at regular intervals.

### **2.3 Documentation and information**

**2.3.1** The following documentation is to be made available to the Society for the approval of the scheme:

- a) procedure for changes to software system and CM parameters
- b) listing of equipment to be included in the scheme
- c) listing of acceptable condition monitoring parameters
- d) description of CBM scheme
- e) listing, specifications and maintenance procedures for condition monitoring equipment
- f) baseline data for equipment with condition monitoring
- g) qualification of authorized personnel and company responsible for analysing CM results.

**2.3.2** In addition to the above documentation the following information is to be available on board:

- a) all the documentation in [2.3.1], duly updated
- b) maintenance instructions (manufacturer's and shipyard's)
- c) condition monitoring data including all data since last opening of the machine and the original base line data
- d) reference documentation (trend investigation procedures etc.)
- e) records of maintenance including repairs and renewals carried out
- f) records of changes to software systems and parameters
- g) sensors calibration records / certification / status.

## **2.4 Approval validity**

**2.4.1** An annual audit is to be carried out to maintain the validity of the CM/CBM scheme.

**2.4.2** The survey arrangement for machinery under CM/CBM can be cancelled by the Society if the scheme is not being satisfactorily carried out either from the maintenance records or the general condition of the machinery.

**2.4.3** Items under CM/CBM scheme can be cancelled from CM/CBM scheme and moved to CSM scheme by the Society if the scheme is not found to be satisfactorily maintained either from maintenance records or the general condition of the machinery, during annual and renewal audits.

**2.4.4** In the case of sale or change of management of the ship or transfer of class, the approval of CM/CBM is to be reconsidered.

**2.4.5** The ship owner may, at any time, cancel the CM/CBM scheme by informing the Society in writing. In this case the items which have been inspected under this scheme since the last annual audit may be credited for class at the discretion of the attending surveyor.

## **3 Surveys**

### **3.1 Installation survey**

**3.1.1** Condition monitoring equipment is to be installed and surveyed in accordance with the Society's rules, and a set of base line readings is to be taken.

### **3.2 Implementation survey**

**3.2.1** The implementation survey is to be carried out by the Surveyor no earlier than 6 months after installation survey and no later than the first class annual survey.

**3.2.2** During the implementation survey the following is to be verified by the surveyor:

- a) the CM/CBM scheme is implemented according to the approval documentation, including a comparison with baseline data
- b) the scheme is producing the documentation required for the annual audit and the requirements of surveys and testing for the maintenance of class are complied with
- c) the onboard personnel are familiar with operating the scheme
- d) records of any limiting parameters (alarms and warnings) that have been modified during the operation of the scheme
- e) records of any failures of monitored equipment are to be reviewed to ensure that the condition monitoring scheme is effective / sufficient.

**3.2.3** When this survey is carried out and the implementation is found in order, a report describing the scheme is to be submitted to the Society and the scheme may be put into service.

### **3.3 Annual audit**

**3.3.1** An annual audit of the CM and CBM scheme is to be carried out by a Surveyor concurrently with the class annual survey.

**3.3.2** The purpose of this audit is to be to verify that the scheme is being correctly operated and that the machinery has been functioning satisfactorily since the previous audit. This is to include any limiting parameters (alarms and warnings) that have been modified since the last audit. A general examination of the concerned items is to be carried out.

**3.3.3** The performance, condition monitoring and maintenance records are to be examined to verify that the machinery has functioned satisfactorily since the previous survey, or action has been taken in response to machinery operating parameters exceeding acceptable tolerances.

**3.3.4** Written details of breakdown or malfunction are to be made available.

**3.3.5** At the discretion of the surveyor, function tests, confirmatory surveys and random check readings, where Condition Monitoring / Condition Based Maintenance equipment is in use, are to be carried out as far as practicable and reasonable.

**3.3.6** The familiarisation of the Chief Engineer and other authorized personnel involved with the CM/CBM system is to be verified.

**3.3.7** Calibration status of sensors and equipment is to be verified.

**3.3.8** Verification that the suitability of the CM/CBM scheme has been reviewed following defects and failures is to be carried out.

**3.3.9** An annual report covering the year's service is to be supplied to the Society. It is to include the following information:

- the list of items of machinery and components and the procedures for their identification
- the preventive maintenance sheets
- the condition monitoring data, including all data since the last dismantling and the original reference data of the machinery checked through condition monitoring
- any change to the documentation listed in [2.3]
- full trend analysis (including spectrum analysis for vibrations) of machinery displaying operating parameters exceeding acceptable tolerances.

### 3.4 Damage and repairs

**3.4.1** Damage to components or items of machinery is to be reported to the Society. The repairs of such damaged components or items of machinery are to be carried out to the satisfaction of the Surveyor.

**3.4.2** Details of repairs and maintenance carried out are to be examined. Any machinery part, which has been replaced by a spare one, due to damage, is to be retained on board where possible until examined by the Surveyor.

**3.4.3** Defect and failure data is to be reviewed in order to ensure the system output is appropriate. Where necessary, following review of the failure data, there is to be a method of amending the CM and CBM scheme.

**3.4.4** For bearings surveyed under the continuous survey system, when a certified monitoring system is in place such a condition based monitoring or manufacturers approved bearing wear monitoring, then there is no need to turn out the bearings unless the monitoring systems are not working properly, suggest there may have been bearings problems or the monitoring data is not available and verifiable over a period covering the CSM cycle.

# Appendix 5 Remote Classification Surveys

## 1 General

### 1.1 Scope

**1.1.1** The surveys of ships may utilize different methods and concepts. This Section contains principles and minimum requirements for carrying out remote surveys.

Remote survey will only be appropriate provided the level of assurance is not compromised, and the survey is carried out with the same effectiveness as and is equivalent to a survey carried out with attendance on board by a Surveyor.

Note 1: Attendance on board by a surveyor means physical attendance on board the ship by a surveyor.

Note 2: Remote classification activities not requiring a survey, such as some administrative tasks, are not to be considered as remote surveys.

Note 3: An administrative task is a task where a survey decision is not being made, for example reissue of a certificate or record following a correction, or an update to the ship's records held by the Society or a document review.

### 1.2 Application

**1.2.1** These requirements apply to all vessels, self-propelled or not.

### 1.3 Definitions

#### 1.3.1 Remote survey

A "Remote Survey" is a process of verifying that a ship and its equipment are in compliance with the Rules where the verification is undertaken, or partially undertaken, without attendance on board by a Surveyor.

#### 1.3.2 Information and communication technology (ICT)

Information and Communication Technology (ICT) are the technologies used in the scope of remote surveys for gathering, storing, retrieving, processing, analysing, and transmitting information which includes both software and hardware.

## 2 Requirements for equivalency

### 2.1 General

**2.1.1** The requirements for equivalency of a remote survey to a survey attended on board by a Surveyor include:

- eligibility of the remote survey
- qualification of Surveyors
- planning of the remote survey
- performance of the remote survey
- assessment of the remote survey
- reporting.

Equivalency is obtained when, with the use of available ICT, a Surveyor can perform a survey remotely being able to:

- obtain the supporting and technical evidence required according to the applicable rules
- verify applicable survey items and relevant tests

and the results of the remote survey provide the same level of assurance obtained with attendance on board by a Surveyor.

### 2.2 Eligibility of the remote survey

**2.2.1** Eligibility of the remote survey is to be decided based on type and scope of the requested survey, in accordance with [3.1] and, if applicable, flag State Administration acceptance and possible instructions, when the classification survey is also related to a statutory item, and the Society is carrying out the statutory survey on behalf of the flag State Administration.

A remote survey is deemed eligible when it provides the same level of assurance, according to the requirements for equivalency, as if it was conducted with attendance on board by a Surveyor.

Remote surveys are generally to be carried out with internet connection allowing a live streaming visual examination, although, at the discretion of the Surveyor, a combination of remote survey methods (see [2.4]) may be used. For simple/limited verifications, other types of ICT may be accepted by the Surveyor.

## **2.3 Planning of the remote survey**

**2.3.1** Planning of the remote survey is required to ensure that the remote survey is carried out in accordance with the applicable requirements. The content of the planning is to be based on the scope of the remote survey.

To ensure that the Surveyor can properly plan the remote survey and communicate with personnel/crew, so that the survey is carried out according to the applicable rules, adequate means are to be available enabling the Surveyor and allowing the Society to:

- properly interact with personnel/crew involved in the remote survey, before and during the survey process
- agree on ICT means to be used
- verify that personnel/crew involved in the remote survey are suitably skilled to use the electronic devices and/or software used by the Society to perform the remote survey
- acquire as deemed necessary information on identity and ranking of personnel/crew involved in the remote survey
- provide the survey item/scope to the personnel/crew involved in facilitating the remote surveys, including the tests that will be performed
- communicate, during the remote survey, additional actions depending on the evidence to be collected.

One or more of the following means is to be provided for planning the remote survey:

- live-streaming video and audio connection
- exchange of data / electronic documents
- other means acceptable to the Society.

The Owner is to provide the necessary facilities for the safe execution of the survey.

## **2.4 Performance of the remote survey**

**2.4.1** To ensure that the Surveyor can properly perform the remote survey according to the applicable rules, the available evidence must allow the attending surveyor to:

- examine and assess a survey item and/or a group of items and/or supporting documents
- verify and assess applicable tests and/or services.

The evidence provided to the Surveyor is subject to the technical evaluation and final acceptance by the Surveyor with respect to the completeness and accuracy, necessary to perform the requested survey according to the applicable requirements.

One or more of the following evidence is to be provided for performing the remote survey:

- live-streaming video and audio
- recorded videos provided by the Owner's representative
- photos provided by the Owner's representative
- other data and/or supporting documents acceptable to the Society.

## **2.5 Assessment of the remote survey**

**2.5.1** The Surveyor is to evaluate all evidence received and accept them before crediting the remote survey.

The means used for the remote survey must allow the Surveyor to collect the necessary evidence that will be examined according to the Surveyor's professional judgement in order to satisfactorily complete and credit the relevant survey items.

In case the Surveyor, according to their professional judgement, deems that the remote survey does not provide the same level of assurance as a survey with attendance on board by a Surveyor, the Surveyor may decide not to credit the relevant survey items.

# **3 Scope and procedures**

## **3.1 Scope - eligible survey items**

**3.1.1** A remote survey may be proposed as an alternative to a survey attended on board by a Surveyor for the surveys listed in Tab 1.

When the classification survey is also related to a statutory item, and the Society is carrying out the statutory survey on behalf of the flag State Administration, then the flag State Administration acceptance is required, and possible additional requirements are to be complied with.

The Surveyor may require to confirm the results of the remote survey, by a survey attended on board by a Surveyor, to credit the relevant survey items, in case the remote survey is not carried out to the Surveyor's satisfaction or it is required by the Society.

Table 1 : Eligible remote survey items

No.	Surveys and related items eligible to remote survey	Live streaming required
1	Postponement, issuance, deletion of Condition of Class	X (1)
2	Postponement of Class surveys	X (1)
3	Items of Continuous Survey for Machinery (see Ch 2, Sec 2, [4.3]) or Planned Maintenance Scheme (see Ch 2, Sec 2, [4.4])	X (1)
4	Occasional survey for change of ship's name	X (1)
5	Occasional survey for loss of anchor	X (1)
6	Occasional survey for minor (2) machinery or equipment damage	X (1)
7	Occasional survey for minor (2) hull damage	X (1)
8	Occasional survey for minor (2) deficiencies/defects not subject to a Condition of Class	X (1)
9	In-water bottom survey	X
10	Specified items of a class periodical survey (excluding additional specific items of initial or renewal surveys), including completion of remaining items of a part held class periodical survey	X (1) (3)
11	Non-propelled / un-manned barges/pontoon – annual surveys when no survey of hull compartments is due	X (1)
12	Minor (2) retrofit / installation / upgrade of equipment	X (1)
13	Documentary or data based initial / periodical / renewal / occasional verifications and surveys	(4)
<p>(1) Live streaming may not be required for minor survey scope or that a combination remote survey method, as listed in [2.4], may be used at the sole discretion of the Society</p> <p>(2) "Minor" in the items 6, 7, 8 and 12 means that the item can be surveyed remotely according to requirements for equivalency given in [2]</p> <p>(3) Pure documentary verifications are eligible in accordance with item 13</p> <p>(4) Live streaming may be required for surveys not marked X in the Table, depending on the survey scope at the sole discretion of the Society</p>		

## 3.2 Procedures

### 3.2.1 Eligibility

Refer to [2.2].

### 3.2.2 Digital information quality, completeness, and accuracy

Final appraisal of the quality of digital information is at the discretion of the Surveyor, who is to be satisfied with the content and the quality of digital information collected, and the survey carried out, allowing the Surveyor to confirm its completion.

The Owner is responsible for the completeness and accuracy of digital information provided. The digital information submitted by the Owner to the Surveyor is to reflect the real situation of the surveyed item. The date and time, when a photo or video was taken are to be made available to the Surveyor or identifiable from its metadata.

The Society is to collect and store digital information as evidence of the survey. It is not necessary to store all of digital information received; the exact digital information stored is to support the survey decision and is to be decided by the Surveyor crediting the survey.

The remote survey is carried out under the supervision and upon instructions of the Surveyor, who is in charge of crediting the remote surveys. A surveyor attendance on board may be required to complete the survey, upon the Surveyor's request and at their discretion.

### 3.2.3 Requirements for a remote survey when live streaming is not used

When live streaming is not used, communication and digital information collection are to be performed through an ICT channels (such as emails, data streams and clouds), which is to be accepted by the Society prior to the survey.

The Owner's representative is to confirm the identity of the ship at the commencement of the survey.

### 3.2.4 Requirements for a remote survey when live streaming is used

The Owner's is to ensure that:

- the Owner's representative is attending on board and has access to the areas intended to be surveyed
- the Owner's representative has at his disposal a 2-ways visual and audible communication means complying with the requirements in [4]
- ICT solution is available on the communication means and meets the requirement described in [4].

In the case these requirements cannot be fulfilled, the remote survey may be rejected. The Surveyor is to verify the identity of the ship at the commencement of the survey by live streaming.

### **3.3 Hardware and ICT solution**

**3.3.1** Refer to [4.2].

### **3.4 Requirements for connectivity**

**3.4.1** The Owner's representative is to ensure that internet connectivity tests are carried out before the survey and that proper connectivity is available and maintained during the survey.

When remote survey by live streaming is being undertaken, a connection that enables live streaming between the Surveyor and the Owner's representative attending on board is required. The quality of the live streaming connection (audio and video) is to ensure proper communication and to allow the Surveyor to carry out the survey remotely, to the Surveyor's satisfaction. In the case where a live streaming connection with the Surveyor is not possible or is not continuous at the place of the survey (e.g., Engine Room), partly online sequences (where the Owner is able to capture pictures and videos offline of those items not covered by live streaming) may be accepted by the Surveyor.

## **4 Information and Communication Technology (ICT)**

### **4.1 General**

**4.1.1** This Article outlines the minimum requirements for the use of ICT that can capture images, record video and/or live stream video or other data from a ship as considered acceptable to the Society.

### **4.2 Hardware**

**4.2.1** The Owner is responsible for ensuring that all hardware installations on board used for the remote survey comply with the applicable requirements relevant for use and location on board, including hazardous areas. The ICT is to typically consist of:

- A host computer device, to receive the streaming of images/data/video. This is usually a laptop or desktop computer compatible with the software application used for the remote survey.
- Onboard standalone device which may include digital cameras capable of capturing videos/photos/data.
- Onboard smart device compatible with the applicable software/technology.
- Communication accessories like headphones and microphone for the noisy environment as applicable and as deemed necessary.

Note 1: The smart device may be a smartphone, tablet, computer, wearable device, smart glass, digital camera, or any other device which can be connected to the network and capable of transmitting the necessary data/images to shore.

The communication equipment used for the live streaming is to have the following minimum functionality:

- both ends are to simultaneously see the same image/videos in near real-time (i.e., live streaming)
- two-way direct voice communication
- possibility to take screenshots.

When using a portable device on board for live streaming, the movement of the handheld device may affect the stability of the video and the image, leading to lower quality outputs. When necessary, a suitable anti-shake device is to be used to provide proper stability.

Note 2: The host computer screen is to be able to present an image quality that is sufficient to enable a survey decision to be made.

Note 3: Portable equipment on board is to be equipped with a power capacity suitable for the intended scope and time of the survey.

### **4.3 Internet connectivity (coverage and speed)**

**4.3.1** For internet connectivity requirements on board, refer to [3.4].

The onboard smart devices are to have the capability of transmitting the images/video/data over a Cellular, Wi-Fi or Satellite Connection to the remote Surveyor.

When live streaming communication is applied, the internet connection is to have sufficient and stable bandwidth capacity to ensure quality (such as resolution and frame rate) of the direct colour image/video and voice communication to the remote survey location to the satisfaction of the Surveyor.

### **4.4 Software and data security**

**4.4.1** The software used for the remote survey is to be acceptable to the Society. The overall function and ability of the software used to ensure the security of data are to be evaluated prior to use as per the below requirements.

The Surveyor is to normally control the live video call, providing instructions to the on-site personnel/crew and supervising survey activities for capturing relevant information. The onboard device is to have the capability of transmitting the data over a Cellular, Wi-Fi, or Satellite Connection to the Surveyor.

The software used to perform the remote survey may also be provided with technologies that support the Surveyor in the process of making a decision, such as:

- Artificial Intelligence (AI) for the recognition and the classification of defects.
- Internet of things (IoT) for collecting parameters and evaluating acceptability/working condition of machinery and equipment.
- Data driven verification or other means considered acceptable by the Society.

The above software and technologies are to be evaluated and accepted by the Society in each case.

When considering the use of software/applications and other technologies, data protection are to be considered in accordance with applicable requirements of the Society before the remote survey is commenced. The software/application used to perform the remote survey is to be compatible with the technical requirements detailed in this paragraph; in addition, the software used is to comply with the Society's applicable requirements for:

- cybersecurity
- data protection and confidentiality for the transmitted data.

When not provided by the Society itself, the audio/video software or application used to perform the remote survey is to be accepted by the Society.

During the survey preparation, it is the Owner's responsibility to ensure that their data security policies are implemented as per the Company's Safety Management System.

Note 1: The Company's SMS may take into account IMO resolution MSC.428(98), MSCFAL.1/Circ.3 and IACS Rec.166.

## **5 Recording of evidence and reporting of survey**

### **5.1 Recording of evidence**

#### **5.1.1 Required evidence**

Refer to [2.4].

In principle, live streaming video and audio are to be applied to remote surveys as a primary means (refer to Tab 1).

Additionally, and/or alternatively, one or more of the following evidence may be submitted or verified as requested by the Surveyor during remote survey so that the Surveyor is able to verify conditions of survey items:

- Recorded video and audio.
  - Photos.
  - Master's/chief engineer's statement.
  - Ship's logbook.
  - Owner's confirmation.
- a) Live streaming video and audio:  
Live streaming video and audio using ICT are to be in accordance with the requirements in [4].
- b) Recorded videos/photos:  
For the recorded videos/photos, the following information is to be available:
- confirmation that they were actually taken on the ship by the Owner's representative
  - date and time when they were taken
  - identity of the personnel/crew responsible for taking evidence.
- c) Master's/chief engineer's statement:  
Recorded videos/photos provided by the Owner's representative may be supplemented with a statement signed by the master and/or the chief engineer confirming the condition of the items shown in the evidence. The final evaluation of the remote survey by the Surveyor is to be based on all of the provided evidence, and it does not delegate the responsibility to the master/chief engineer's statement only.
- d) Ship's logbook:  
The Master is to make entries into ship's logbook on the following occasions and submit copies of the relevant pages when requested by the Surveyor:
- when a remote survey is carried out by the Surveyor
  - when videos/photos are taken and submitted to the Surveyor with the master's/chief engineer's statement and additional documents as applicable.
- e) Owner's confirmation:  
The Owner's representative or the master is to confirm the correctness and completeness of the provided information and evidence (if any) relevant to the condition of the items requested to be surveyed. This confirmation may be included in the survey application.

### 5.1.2 Retaining/filing evidence

The evidence submitted by the Owner's representative or master is to be retained/filed in accordance with the Society's procedures which are to include:

- type of evidence to be retained/filed
- duration/location to be retained/filed.

It is not required for the Society to record and save live streaming video and audio as evidence unless the Surveyor considers it necessary.

### 5.1.3 Other supporting documents

The Surveyor may request the Owner's representative or master to submit supplementary documents such as ship's maintenance reports and record for the operation of machinery and equipment and service reports issued by manufacturers, service suppliers or service providers.

While the Surveyor is to verify that the documents are duly prepared and issued to the ship, they may not be required to be retained/filed by the Society as evidence.

## 5.2 Reporting of remote survey

**5.2.1** The report of a remote survey is to be issued in accordance with the Society's procedure. The survey report is also to include the following additional information:

- indication that the survey was carried out remotely
- description of the means used during the remote survey
- indication of the provided evidence
- confirmation of the Flag State Administration's authorization, when applicable.

# Part A

## Classification and Surveys

---

### CHAPTER 3

## SCOPE OF SURVEYS (ALL SHIPS)

---

Section 1	Annual Survey
Section 2	Intermediate Survey
Section 3	Class Renewal Survey
Section 4	Bottom Survey
Section 5	Tailshaft Survey
Section 6	Boiler Survey
Section 7	Hull Survey for New Construction
Section 8	Survey of Watertight Cable Transits
Appendix 1	Class Requirements and Surveys of Laid-up Ships

# Section 1 Annual Survey

## 1 General

### 1.1

**1.1.1** The requirements of this Section apply to annual surveys of all ships. The specific requirements for annual surveys related to service notations and additional class notations assigned to ships are addressed in Part A, Chapter 4 and Part A, Chapter 5, respectively.

Note 1: Ships assigned with the service notation **yacht** and having a length less than 24 m are not submitted to annual surveys for hull and machinery, as described in NR500.

**1.1.2** At the time of annual surveys, the ship is to be generally examined. The survey is to include a visual inspection of the hull, equipment and machinery of the ship and some tests thereof, so far as necessary and practicable in order to verify that the ship is in an acceptable general condition and is properly maintained.

**1.1.3** Owners are reminded that, in compliance with the requirements in Ch 2, Sec 2, [6.4], any modification to the ship's hull, equipment and machinery affecting its classification is to be made known to the Society.

## 2 Hull

### 2.1 Hull and hull equipment

**2.1.1** The survey is to include a general external examination and testing, where appropriate, of the following items, as applicable:

- outer shell plating above the waterline, relevant shell doors and accessible parts of the rudder(s)
- plating of freeboard deck and exposed decks, superstructures, with their openings and means of closure
- means of closing and securing the weathertightness of miscellaneous openings in freeboard, superstructure and exposed decks (cargo hatchways, other hatchways and other openings) (for details see [2.3])
- sidescuttles and deadlights, chutes and other openings with their means of closure
- bulwarks and, if applicable, the provision of freeing ports, special attention being paid to freeing ports with shutters
- guardrails, gangways, walkways, ladders and any other means provided for the protection of the crew and means for safe passage for crew
- inlets, scuppers and sanitary discharges, valves on discharge lines and their controls
- ventilators, air pipes, overflow pipes and gas vent pipes, with their coamings, means of closure and flame screens, where required
- flame screens on vents to all bunker tanks
- all air pipe heads installed on the exposed decks (i.e. those extending above the freeboard deck or superstructure decks)
- weld connection between air pipes and deck plating
- fittings and appliances for timber deck cargoes, where applicable
- verification of the position of the deck line (or reference line) and load lines and timber marks, if any, which, if necessary, are to be re-marked and re-painted
- deck equipment such as lifeboat davit foundations, bollards, fairleads, hawse pipes, etc., masts and associated rigging, including lightning conductors
- anchoring and mooring equipment, as far as practicable
- towing and mooring equipment properly marked with any restriction associated with its safe operation (only for ships built after 1st January 2007).
- watertight bulkheads, their watertight doors and associated local and remote controls, and their watertight penetrations
- main and auxiliary steering arrangements, including their associated equipment and control systems, and manoeuvring gear
- fire divisions and fire doors, dampers in ventilation ducts, means of closure of skylights and other openings
- confirmation, as far as practicable, that no significant changes have been made to the arrangement of the structural fire protection, including cargo spaces intended for the carriage of dangerous goods
- confirmation that emergency escape routes from accommodation and service spaces are satisfactory
- accessible cargo holds, in particular in areas likely to be damaged by cargo handling
- confirmation that the drainage from enclosed cargo spaces situated on the freeboard deck is satisfactory
- engine room
- where fitted, helicopter deck and its supporting structure, safety net and arrangements for the prevention of sliding

- availability of loading manual
- availability of electronic loading instrument, where required, and verification with standard test
- availability of approved stability documentation
- checking, in general, that there has been no deterioration in the strength of the hull
- verification that no alterations have been made to the hull or superstructures that would affect the position of the load lines
- superstructure end bulkheads and openings therein
- watertight integrity of the closures to any openings in the ship's side shell below the freeboard deck (particularly, cargo ports and other similar openings)
- garbage chutes, as far as practicable
- spurling pipes and cable lockers for verification that permanent devices are fitted to minimize water ingress
- if applicable, special requirements for ships permitted to sail with type "A" or type "B-minus" freeboard (machinery casing, gangway and access, hatchways and freeing arrangements)
- hull and its closing appliances, in general and as far as can be seen
- for ships fitted with independent cargo tanks, confirmation that cargo piping and tanks are electrically bonded to the hull, as applicable.

Note 1: Due attention is also to be given to fuel oil piping passing through ballast tanks, which is to be pressure tested where doubts arise.

**2.1.2** Suspect areas identified at previous surveys are to be examined. Thickness measurements are to be taken of the areas of substantial corrosion and the extent of thickness measurements is to be increased to determine areas of substantial corrosion, in accordance with the requirements of Ch 3, Sec 3, Tab 4. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

Note 1: These requirements are not applicable to cargo tanks of oil tankers, chemical tankers and double hull oil tankers surveyed in accordance with the requirements of Ch 4, Sec 3 and Ch 4, Sec 4.

**2.1.3** Examination of ballast tanks when required as a consequence of the results of the class renewal survey and intermediate survey is to be carried out. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that Substantial Corrosion is found, then the extent of thickness measurements is to be increased to determine areas of substantial corrosion, in accordance with the requirements of Ch 3, Sec 3, Tab 4. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

## **2.2 Survey of watertight cable transits**

**2.2.1** The Cable Transit Seal Systems Register, as detailed in Ch 3, Sec 8, is to be reviewed to confirm it is being maintained and, as far as practicable, the transits are to be examined to confirm their satisfactory condition.

**2.2.2** Where there are records entered since the last annual survey of any disruption to the cable transits or installation of new cable transits, the satisfactory condition of those transits is to be confirmed by review of records and, if deemed necessary, by examination. The results are to be recorded in the Cable Transit Seal Systems Register against the specific cable transit.

## **2.3 Hatch covers and coamings**

**2.3.1** The Owner or his representative is to declare to the attending Surveyor that no significant changes have been made to the hatch covers, hatch coamings and their securing and sealing devices without prior approval of the Society.

The survey of hatch covers and coamings is to include:

- a) when fitted with portable covers, or wooden or steel pontoons, checking of the satisfactory condition, where applicable, of:
  - wooden covers and portable beams, carriers or sockets for the portable beams, and their securing devices
  - steel pontoons
  - tarpaulins
  - cleats, battens and wedges
  - hatch securing bars and their securing devices
  - loading pads/bars and the side plate edge
  - guide plates and chocks
  - compression bars, drainage channels and drain pipes (if any)
- b) when fitted with mechanically operated steel covers, checking of the satisfactory condition, as applicable, of:
  - hatch covers
  - tightness devices of longitudinal, transverse and intermediate cross junctions (gaskets, gasket lips, compression bars, drainage channels and, if any, drain pipes)
  - clamping devices, retaining bars, cleating
  - chain or rope pulleys
  - guides

- guide rails and track wheels
  - stoppers, etc.
  - wires, chains, gypsies, tensioning devices
  - hydraulic system essential to closing and securing
  - safety locks and retaining devices
  - the operation of hatch covers, by means of random examination: stowage and securing in open condition, proper fit, locking and efficiency of sealing in closed position, operational testing of hydraulic and power components, wires, chains and link drives
- c) checking of the satisfactory condition of hatch coaming plating and its stiffeners, where applicable.

### **3 Machinery and systems**

#### **3.1 General machinery installations**

**3.1.1** The survey of general machinery installations is to cover the following items:

- confirmation that the machinery, boilers and other pressure vessels, associated piping systems and fittings are maintained so as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards
- confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative
- confirmation that provisions are made so as to bring the machinery into operation from the dead ship condition without external aid
- confirmation that the means of escape from accommodation, machinery and other spaces are satisfactory
- general examination of the machinery, boilers, all steam, hydraulic, pneumatic and other systems and their associated fittings, for confirmation of their proper maintenance
- examination of the means for the operation of the main and auxiliary machineries essential for the safety of the ship (including the control, monitoring, reporting, alert and safety action)
- test of the means of remotely controlling the propulsion machinery from the navigation bridge, where applicable
- examination of the arrangements to operate the main and other machineries from a machinery control room, where applicable
- confirmation that the ventilation system for the machinery spaces works correctly
- confirmation that the engine-room telegraph, the second means of communication between the navigation bridge and the machinery, and the means of communication with any other position, from where the engines can be controlled, operates satisfactorily
- confirmation that the engineer's alarm is clearly audible in the engineers' accommodation
- confirmation that the means of communication between the navigation bridge and the steering compartment are satisfactorily operating
- confirmation that the means of indicating the angular position of the rudder are satisfactorily operating
- for ships having emergency steering positions, confirmation that means of relaying heading information (telephone or other means of communication) are provided; confirmation that means to supply visual compass readings to the emergency steering position are provided if necessary
- confirmation that the various alarms required for hydraulic power-operated, electric- and electro-hydraulic steering gears work satisfactorily
- confirmation that the re-charging arrangements for hydraulically operated steering gears are maintained
- examination, as far as practicable, of the bilge pumping systems and bilge wells, including operation of the pumps, remote reach rods and level alarms, where fitted
- visual examination of the condition of any expansion joints in sea water systems
- examination of the arrangements for periodically unattended machinery spaces and, in particular, the random testing of alarms, automatic and shut-down functions
- external examination of pressure vessels other than boilers and their appurtenances, including safety devices, foundations, controls, relieving gear, high pressure piping, insulation and gauges
- examination, where applicable, of the alternative design and arrangements for machinery or electrical installations, or fire safety, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation
- confirmation that the ballasting arrangements are satisfactory.

**3.1.2** When the ship is equipped with a refrigerating plant (whether or not covered by an additional class notation), the annual survey is to include the external examination of:

- pressure vessels of the installation to the same extent as indicated in [3.1.1]
- refrigerant piping, as far as practicable
- for refrigerating machinery spaces using ammonia as refrigerant:
  - ventilation system including functional test
  - water-spraying fire-extinguishing system; see [3.4.2] item d)
  - bilge system including functional test
  - electrical equipment, confirming its proper maintenance
  - gas detection system
  - breathing apparatus and protective clothing.

**3.1.3** When the ship is equipped with thruster installations, the annual survey is to include:

- an external examination of the machinery installation
- an operating test of the complete installation.

**3.1.4** For ships subject to compliance with the requirements laid down in Ch 6, Sec 2, [6], or in Ch 6, Sec 4, [2], or in Pt B, Ch 2, Sec 1, [2.2], the annual survey is to include an examination and a test of the water ingress detection systems and of their alarms at random.

**3.1.5** For ships subject to compliance with the requirements laid down in Ch 6, Sec 2, [7], or in Pt C, Ch 1, Sec 10, [6.6.3], item e), the annual survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

**3.1.6** For ships fitted with an exhaust gas cleaning system (scrubber), the annual survey is to include an examination of the distance pieces on the overboard discharge system of the scrubber and a confirmation that there is no reduction of thickness of these distance pieces.

**3.1.7** When the ship is equipped with a ballast water treatment system using an inert gas generator and where this inert gas generator is used solely for the purpose of ballast water treatment, the annual survey is to include the relevant items of Ch 4, Sec 4, [3.4].

## **3.2 Boilers**

**3.2.1** For main and auxiliary steam boilers, the annual survey consists of an external examination of boilers and their appurtenances, including safety devices, foundations, controls, relieving, high pressure and steam escape piping, insulation and gauges.

The annual survey is to include test of safety and protective devices and test of safety valve using its relieving gear.

For exhaust gas heated economizers, the safety valves are to be tested by the Chief Engineer at sea within the annual survey window. This test is to be recorded in the log book for review by the attending Surveyor prior to crediting the Annual Survey of Machinery.

**3.2.2** For thermal oil heaters, a functional test while in operation is to be carried out, during which the following items are checked:

- the heater for detection of leakages
- the condition of the insulation
- the operation of indication, control and safety devices
- the condition of remote controls for shut-off and discharge valves.

A satisfactory analysis of the quality of oil is to be made available to the Surveyor.

**3.2.3** For exhaust gas thermal oil heaters, in addition to the requirements of [3.2.2], a visual examination and a tightness testing to the working pressure of the heater tubes are to be carried out.

**3.2.4** For electrical steam generators, a functional test while in operation is to be carried out, during which the following items are checked:

- the heater system for detection of leakages
- the operation of indication, control, alarm and safety devices.

### **3.3 Electrical machinery and equipment**

**3.3.1** The survey of electrical machinery and equipment is to cover the following items:

- general examination, visually and in operation, as feasible, of the electrical installations for power and lighting, in particular main and emergency generators, electric motors, switchboards, switchgears, cables and circuit protective devices, indicators of electrical insulation and automatic starting, where provided, of emergency sources of power
- checking, as far as practicable, the operation of emergency sources of power and, where they are automatic, also including the automatic mode
- verification that the precautions provided against shock, fire and other hazards of electrical origin are maintained.

**3.3.2** The survey is also to cover the bridge control of propulsion machinery, and related arrangements (alarms and safety devices), when fitted.

The survey of an automated installation covered by an additional class notation is detailed in Part A, Chapter 5.

**3.3.3** The survey is also to cover the computerized systems through the control of the Software Registry as mentioned in Pt C, Ch 3, Sec 3. This survey shall include:

- checking of modification of Software Registry, in particular the reporting of security checks during software modification inside the Software Registry
- checking that revision of software mentioned in Software Registry corresponds with revision effectively used for at least one computerized system chosen at the satisfaction of the Surveyor
- checking that Software Registry has been updated according to the last ship relevant modifications.

**3.3.4** For ships where the electrical distribution system includes harmonic filters, the survey is to include:

- Annual measurement, as a minimum, of the harmonic distortion levels of main busbars under seagoing conditions as close to the periodical machinery survey as possible so as to give a clear representation of the condition of the entire plant to the Surveyor. Harmonic distortion readings are to be carried out when the greatest amount of distortion is indicated by the measuring equipment. An entry showing which equipment was running and/or filters in service is to be recorded in the log so this can be replicated for the next periodical survey. Harmonic distortion levels are also to be measured following any modification to the ship's electrical distribution system or associated consumers by suitably trained ship's personnel or by a qualified outside source.
- Verification that records of all above measurements are made available to the Surveyor at each periodical survey.

Note 1: Those requirements apply at any scheduled machinery periodical survey having a due date on or after 1<sup>st</sup> July 2017 for ships contracted for construction before 1<sup>st</sup> July 2017.

- For ships contracted for construction on or after 1<sup>st</sup> July 2017, verification that the facilities used for continuous monitoring of the levels of harmonic distortion experienced on the main busbars as well as alerting the crew when the level of harmonic distortion exceeds the acceptable limits are working properly and review of corresponding records.

**3.3.5** For Li-Ion batteries of a capacity above 20kWh or used as emergency source or transitional source, the survey is to include:

- general examination of the battery pack(s)
- general examination of the battery monitoring system
- general examination of the battery support system
- general examination of the battery compartment, including visual check of the safety measures and functions related to battery spaces, i.e. battery installation, ventilation, fire safety measures and alarms
- check of the electrolyte level and pH level
- check of State of health (SOH) of battery system according to the Manufacturer's specification and verification that the battery capacity has been regularly recorded and complies with the parameters specified by the Manufacturer
- test of sensor and alarm associated to the battery at random
- undertaking of measurement of insulation of battery packs
- additional checks when some specific part of the battery is or has been replaced (e.g. battery cells, BMS) according to the Manufacturer specification and to the satisfaction of the Surveyor.

**3.3.6** For batteries used for electrical supply of pods, the survey is to include:

- verification of proper working of monitoring systems
- verification of proper working of alarms and defaults and related functions and/or interfacing to the other ship systems
- disconnection of the electrical storage system (ESS) in different operating modes, and automatic start of stand-by source, as necessary
- test of the fire detection of the battery compartment
- test of the gas detection system of the battery compartment
- examination of the fire-extinguishing system of the battery compartment as applicable in accordance with the relevant requirements given in [3.4]
- verification that accessibility for common maintenance and devices for battery overhaul, if any, are maintained.

### **3.4 Fire protection, detection and extinction**

**3.4.1** The survey of fire prevention and other general arrangements is to cover the following items:

- checking that fire control plans are properly posted
- examination and testing, as feasible, of the operation of manual and/or automatic fire doors, where fitted
- checking, as far as practicable, that, where fitted, the remote controls for stopping fans in accommodation spaces and the means of cutting off power to the galley are in working order
- examination of the fire-extinguishing and special arrangements in the machinery spaces and confirmation, as far as practicable and as appropriate, of the operation of the remote means of control provided for the opening and closing of the skylights, the release of smoke, the closure of funnel and ventilation openings, the closure of power operated and other doors, the stopping of ventilation and boiler forced and induced draft fans and the stopping of oil fuel and other pumps that discharge flammable liquids
- examination of the arrangements for remote closing of valves for oil fuel, lubricating oil and other flammable oils and confirmation, as far as practicable and as appropriate, of the operation of the remote means of closing valves on the tanks that contain oil fuel, lubricating oil and other flammable oils
- test of the means of stopping power ventilation systems from outside the spaces served
- examination and testing of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways, tunnel or other closing means for various openings, where applicable
- examination, as far as practicable, and testing, as feasible and at random, of the fire and/or smoke detection systems
- examination, where applicable, of the alternative design and arrangements for fire safety or life-saving appliances and arrangements, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation.

**3.4.2** The operational readiness and maintenance of fire-fighting systems is to be checked. Confirmation that its means of operation is clearly marked. The survey requirements for all types of fire-fighting systems that are usually found on board ships related either to machinery spaces or cargo spaces or vehicle spaces or special category spaces or ro-ro spaces or accommodation spaces, irrespective of the service notation assigned, are the following:

- a) water fire system
  - examination of the fire main system and confirmation that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants, at any part of the ship whilst the required pressure is maintained in the fire main
  - checking that fire hoses, nozzles, applicators, spanners and international shore connection (where fitted) are in satisfactory working condition and situated at their respective locations
- b) fixed gas fire-extinguishing system
  - external examination of receivers of CO<sub>2</sub> (or other gas) fixed fire-extinguishing systems and their accessories, including the removal of insulation for insulated low pressure CO<sub>2</sub> containers
  - examination of fixed fire-fighting system controls, piping, instructions and marking; checking for evidence of proper maintenance and servicing, including date of last system tests
  - checking that fixed CO<sub>2</sub> fire-extinguishing systems for the protection of machinery spaces and cargo pump-rooms, where applicable, are provided with two separate controls, one for opening of the gas piping and one for discharging the gas from the storage container, each of them located in a release box clearly identified for the particular space
  - test of the alarm triggered before the CO<sub>2</sub> is released
- c) sprinkler system
  - examination of the system, including piping, valves, sprinklers and header tank
  - test of the automatic starting of the pump activated by a pressure drop
  - check of the alarm system while the above test is carried out
- d) water-spraying system
  - examination of the system, including piping, nozzles, distribution valves and header tank
  - test of the starting of the pump activated by a pressure drop (applicable only for machinery spaces)
- e) fixed foam systems (low or high expansion)
  - examination of the foam system
  - test to confirm that the minimum number of jets of water at the required pressure in the fire main is obtained when the system is in operation
  - checking the supplies of foam concentrate and receiving confirmation that it is periodically tested (not later than three years after manufacture and annually thereafter) by the manufacturer or an agent
- f) dry powder system
  - examination of the dry powder system, including the powder release control devices
  - checking the supplies of powder contained in the receivers and that it has maintained its original smoothness
  - checking that the pressure of propelling inert gas contained in the relevant bottles is satisfactory.

**3.4.3** As far as other fire-fighting equipment is concerned, it is to be checked that:

- semi-portable and portable fire extinguishers and foam applicators are in their stowed positions, with evidence of proper maintenance and servicing, and detection of any discharged containers
- the fire fighter's outfits including its self-contained compressed air breathing apparatus and emergency escape breathing devices (EEBDs) are complete and in satisfactory condition and provision of two-way portable radiotelephone apparatus of an explosion-proof type or intrinsically safe; where more than one fire-fighter's outfit is carried, confirmation that they are stored in separated positions
- the cylinders, including the spare cylinders, of any self-contained breathing apparatus are suitably charged, and that onboard means of recharging breathing apparatus cylinders used during drills or a suitable number of spare cylinders to replace those used are provided.

**3.4.4** The fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep-fat cooking equipment in accommodation and service spaces are to be examined.

**3.4.5** Where a helideck is fitted, the helicopter facilities are to be checked, as far as appropriate:

- drainage arrangements around the landing area
- fire fighting appliances and arrangements (to be surveyed as per [3.4.2], according to the equipment installed
- overall examination of refuelling systems and hangar facilities for cleanliness and absence of leaks, condition of gutters and drainage arrangement
- availability of an operations manual, including a description and a checklist of safety precautions, procedures and equipment requirements.

**3.4.6** When appropriate, the examination of the special arrangements for carrying dangerous goods is to be carried out, including checking of the electrical equipment and wiring, the ventilation, the provision of protective clothing and portable appliances, testing any fire detection and alarm system and any sample extraction smoke detection system and testing as far as practical, the water supply, bilge pumping and any water spray system.

**3.4.7** For ships designed to carry containers on or above the weather deck, as applicable, examination of the water mist lance, and as appropriate, the mobile water monitors and all necessary hoses, fittings and required fixing hardware.

### **3.5 General emergency alarm system**

**3.5.1** The general emergency alarm system is to be examined and tested.

## Section 2 Intermediate Survey

### 1 General

#### 1.1

**1.1.1** The requirements of this Section apply to intermediate surveys of all ships. The specific requirements for intermediate surveys related to service notations and additional class notations assigned to ships are addressed in Part A, Chapter 4 and Part A, Chapter 5, respectively.

**1.1.2** A survey planning meeting is to be held prior to the commencement of the survey.

**1.1.3** Concurrent crediting to both Intermediate Survey and Class Renewal Survey for surveys and thickness measurements of spaces are not acceptable.

**1.1.4** The intermediate survey is to include examination and checks on a sufficiently extensive part of the structure to show that the structures of the ship are in satisfactory condition so that the ship is expected to operate until the end of the current period of class, provided that the ship is properly maintained and other surveys for maintenance of class are duly carried out during this period.

### 2 Hull

#### 2.1

**2.1.1** The requirements given in Tab 1 for the survey and testing of ballast tanks, cargo holds (for dry cargo ships to which the additional requirements in Ch 4, Sec 2 and Ch 4, Sec 7 do not apply) and cargo tanks (for non-ESP tankers) are to be complied with.

**Table 1 : Intermediate survey of hull (all ships)**

ITEM	Age of ship (in years at time of intermediate survey)		
	5 < age ≤ 10	10 < age ≤ 15	age > 15
BALLAST TANKS	Representative ballast tanks internally examined Thickness measurements, if considered necessary by the Surveyor  See (1) (2) (3)	All ballast tanks internally examined Thickness measurements, if considered necessary by the Surveyor  See (1) (3)	All ballast tanks internally examined Thickness measurements, if considered necessary by the Surveyor Tightness of inner bottom plating of cargo holds in way of double bottom ballast tanks checked, if considered necessary by the Surveyor See (1) (3)
CARGO HOLDS (dry cargo ships, to which the additional requirements in Ch 4, Sec 2 and Ch 4, Sec 7 do not apply)			Selected cargo holds internally examined
CARGO SPACES (for ships other than ships engaged in the carriage of dry cargoes only, or ships subject to Ch 4, Sec 3, Ch 4, Sec 4 or Ch 4, Sec 5)		Selected cargo spaces internally examined	Selected cargo spaces internally examined
CARGO TANKS (non-ESP tankers)		Selected cargo tanks internally examined	Selected cargo tanks internally examined
<p>(1) If such examinations reveal no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains effective.</p> <p>(2) If there is no hard protective coating, soft or semi-hard coating or poor coating condition, the examination is to be extended to other ballast tanks of the same type.</p> <p>(3) For ballast tanks, excluding double bottom ballast tanks, if there is no hard protective coating, soft or semi-hard coating or poor coating condition and it is not renewed, the tanks in question are to be internally examined at annual intervals. When such conditions are found in double bottom ballast tanks, the tanks in question may be examined at annual intervals.</p> <p><b>Note 1:</b> Due attention is also to be given to fuel oil piping passing through ballast tanks, which is to be pressure tested should doubts arise.</p>			

**2.1.2** For ships fitted with independent cargo tanks, external examination of cargo tanks, as far as practicable, including tank supports, chocks and keys. The internal examination may be required if deemed necessary by the Surveyor.

For ships fitted with independent cargo tanks, confirmation that cargo piping and tanks are electrically bonded to the hull, as applicable.

# Section 3 Class Renewal Survey

## 1 General

### 1.1

**1.1.1** The requirements of this Section apply to class renewal surveys of all ships. The specific requirements for class renewal surveys related to service notations and additional class notations assigned to ships are addressed in Part A, Chapter 4 and Part A, Chapter 5, respectively.

**1.1.2** A survey planning meeting is to be held prior to the commencement of the survey.

**1.1.3** Concurrent crediting to both Intermediate Survey and Class Renewal Survey for surveys and thickness measurements of spaces are not acceptable.

**1.1.4** In addition to the requirements of the annual survey, the class renewal survey is to include sufficiently extensive examination and checks to show that the structures, main and auxiliary machinery, systems, equipment and various arrangements of the ship are in satisfactory condition or restored to such condition as to allow the ship to operate for the new period of class of five years to be assigned, provided that the ship is properly maintained and operated and other surveys for maintenance of class are duly carried out during this period.

The examinations of the hull are to be supplemented by testing and thickness measurements as required in [2.5] and [2.6], to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deformation that may be present.

**1.1.5** The Owner is to provide the necessary facilities to enable this class renewal survey. The conditions for survey as detailed in Ch 2, Sec 2, [2.5] to Ch 2, Sec 2, [2.7] are to be met.

**1.1.6** When the ship is under the continuous survey system for hull or machinery, the scope of the class renewal survey as described in this Section is carried out on a continuous basis over the period of class according to the procedure laid down in Ch 2, Sec 2, [4.3].

When the machinery installation is surveyed under the Planned Maintenance System, a specific program of survey replaces the scope of the class renewal survey of machinery and systems as laid down in [3], according to the procedure laid down in Ch 2, Sec 2, [4.4].

**1.1.7** Upon completion of the class renewal survey, or at the end of the period of class (if the relevant part of the ship is surveyed under the continuous survey system), a general examination of the ship having the same scope as that of an annual survey, as detailed in Ch 3, Sec 1, is to be carried out for class renewal.

## 2 Hull and hull equipment

### 2.1 Bottom survey in dry condition

**2.1.1** A bottom survey in dry condition is to be carried out, as detailed in Ch 3, Sec 4, [2], and in addition the requirements given in [2.1.3] to [2.1.5] are to be complied with.

**2.1.2** For ships of unusual characteristics or engaged on special services, means of underwater inspection equivalent to the bottom survey in dry condition may be considered as an alternative by the Society, particularly when a suitable high resistance paint is applied to the underwater portion of the hull or an approved system of impressed current for external cathodic protection is fitted.

**2.1.3** Anchors, windlass(es) and chain cables are to be ranged and examined, and the required complement and condition are to be checked. When the ship is more than 5 years old, chain cables are to be gauged.

Any length of chain cable which is found to be damaged or excessively worn is to be renewed.

**2.1.4** Sea valves and cocks are to be opened up for internal examination.

**2.1.5** Thickness measurements of the outer shell plating, as and if required within the scope of the related class renewal survey, are to be carried out (refer to [2.6]), if not already done within 15 months before the end of class period.

### 2.2 Decks, hatch covers and equipment

**2.2.1** Decks are to be examined, particular attention being given to the areas where stress concentration or increased corrosion are likely to develop, such as hatch corners and other discontinuities of structure.

Deck erections such as hatch coamings, deckhouses and superstructures are to be examined.

The sheathing of wood-sheathed steel decks may be removed, at the Surveyor’s discretion, in the case of doubt as to the condition of plating underneath.

Due attention is to be given to the examination in way of end and side openings and related shell and inner doors.

**2.2.2** The hatch covers and coamings are to be surveyed as follows:

- a thorough survey of the items listed in Ch 3, Sec 1, [2.3] including close-up survey of hatch cover plating and hatch coaming plating, is to be carried out. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey is to be done of the accessible parts of hatch cover structures
- checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including stowage and securing in open condition, proper fit, locking and efficiency of sealing in closed position, operational testing of hydraulic and power components, wires, chains and link drives
- checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent is to be carried out
- thickness measurements of coaming and attached stiffeners, hatch cover plating and stiffeners (see Tab 3).

**2.2.3** The survey of hull equipment is to cover the following points:

- windlass and chain stoppers, with disassembly as deemed necessary to verify the condition of the equipment and control and safety devices, holdfasts, hawse pipes
- steering arrangements, including steering gear, control and indication devices, operational tests and disassembly as deemed necessary; in the case of chain and rod gears, chains, rods, sheaves, pins and rollers are to be examined for wear
- connection of masts and standing rigging to the hull structure as well as condition of structure underneath.

**2.2.4** All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor’s satisfaction to ensure that tightness and condition remain satisfactory; see also [3.5].

**2.2.5** For all ships, except ships having the service notation **passenger ship** or **ro-ro passenger ship**, automatic air pipe heads installed on the exposed decks (i.e. those extending above the freeboard deck or superstructure decks) are to be completely examined, both externally and internally, in accordance with the requirements given in Tab 1.

**Table 1 : Requirements for internal and external examination of automatic air pipe heads at class renewal survey of all ships, except ships with service notation passenger ship or ro-ro passenger ship**

Age of ship (in years at time of class renewal survey)		
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 and subsequent age > 10
Two air pipe heads, one port and one starboard, located on the exposed decks in the forward 0,25 L, preferably air pipes serving ballast tanks. See (1) and (2)	All air pipe heads located on the exposed decks in the forward 0,25 L. See (1) and (2)	All air pipe heads located on the exposed decks. See (3)
Two air pipe heads, one port and one starboard, on the exposed decks, serving spaces aft of 0,25 L, preferably air pipes serving ballast tanks. See (1) and (2)	At least 20% of air pipe heads on the exposed decks serving spaces aft of 0,25 L, preferably air pipes serving ballast tanks. See (1) and (2)	
<p>(1) The selection of air pipe heads to be examined is left to the attending Surveyor.</p> <p>(2) According to the results of this examination, the Surveyor may require the examination of other air pipe heads located on the exposed decks.</p> <p>(3) Exemption may be considered for air pipe heads where there is substantial evidence of replacement after the last renewal survey.</p> <p><b>Note 1:</b> For designs where the inner parts cannot be properly examined from outside, the examination is to include removal of the head from the air pipe.</p> <p><b>Note 2:</b> Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.</p>		

**2.3 Survey of watertight cable transits**

**2.3.1** The requirements for class renewal survey of watertight cable transits may be undertaken by the attending Surveyor or by a certified firm accepted by the Society.

Note 1: Rule Note NR533, Approval of Service Suppliers gives details about the certification.

**2.3.2** All transits are to be examined to confirm their satisfactory condition and the Cable Transit Seal Systems Register is to be reviewed to confirm it is being maintained. The class renewal survey is to be recorded in the Cable Transit Seal Systems Register, in which a single record entry will be sufficient to record the survey of all transits.

**2.3.3** From review of the Cable Transit Seal Systems Register, where there are records entered since the last class renewal survey of any disruption to the cable transits or installation of new cable transits (except which are reviewed and examined at previous annual surveys), the satisfactory condition of those transits is to be confirmed by the attending Surveyor by review of records and examination of the transits; the results are to be recorded in the Cable Transit Seal Systems Register against each of those cable transits.

**2.3.4** In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Cable Transit Seal Systems Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

## **2.4 Holds and other dry compartments**

**2.4.1** Holds, 'tweendecks, cofferdams, pipe tunnels and duct keels, void spaces and other dry compartments which are integral to the hull structure are to be internally examined, ascertaining the condition of the structure, bilges and drain wells, sounding, venting, pumping and drainage arrangements.

At class renewal survey No.3 and subsequent class renewal surveys, structural down flooding ducts and structural ventilation ducts are to be internally examined.

**2.4.2** Machinery and boiler spaces, pump rooms and other spaces containing machinery are to be internally examined, ascertaining the condition of the structure. Particular attention is to be given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops, and bulkheads in way of tank tops and bilge wells. Particular attention is to be given to the sea suction, sea water cooling pipes and overboard discharge valves and their connections to the shell plating. Where wastage is evident or suspected, thickness measurements are to be carried out, and renewals or repairs effected when wastage exceeds allowable limits.

Piping systems inside these spaces are to be dealt with according to [3.5].

**2.4.3** Chain lockers are to be internally examined, while the anchor chains are ranged as required for the bottom survey in dry condition (see [2.1.3]). The pumping arrangement of the chain lockers is to be tested.

## **2.5 Tanks**

**2.5.1** The type and number of tanks to be internally examined at each class renewal survey are detailed in Tab 2, according to the age of the ship.

This internal examination is to ascertain the condition of the structure, bilges and drain wells, sounding, venting, pumping and drainage arrangements, including piping systems and their fittings. Due attention is to be given to plating or double plates below the lower end of sounding and suction pipes.

Where the inner surface of the tanks is covered with cement or other compositions, the removal of coverings may be waived provided they are examined, found sound and adhering satisfactorily to the steel structures.

Note 1: For examination of independent (non-structural) tanks, refer to [3.5.9].

Note 2: Due attention is also to be given to fuel oil piping passing through ballast tanks, which is to be pressure tested when the ship is more than 10 years old.

Note 3: For examination of independent (non-structural) storage tanks for fuel for auxiliary vehicles covered by Pt C, Ch 4, Sec 11, refer to [2.5.6].

**2.5.2** Where provided, the condition of corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in poor condition and it is not renewed, where soft or semi-hard coating has been applied or where a hard protective coating was not applied from time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the surveyor.

When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi hard coating has been applied, or where a hard protective was not applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

**2.5.3** Boundaries of double bottom, deep, ballast, peak and other tanks, both integral and independent tanks, including holds adapted for the carriage of salt water ballast, are to be tested with a head of liquid to the top of air pipes or to near the top of hatches for ballast/cargo holds.

**2.5.4** Boundaries of fuel oil, lube oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lube oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results. The surveyor may extend the testing as deemed necessary.

**2.5.5** For integral tanks which are intended to contain liquid cargoes such as edible oil, the Surveyor may waive the requirement specified in [2.5.4] subject to a satisfactory internal examination.

**Table 2 : Requirements for internal examination of integral (structural) tanks at class renewal survey**

Tank	Age of ship (in years at time of class renewal survey)			
	Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
Peaks (all use)	all	all	all	all
Ballast tanks (all types)	all	all	all	all
Fresh water	none	one	all	all
Fuel oil bunkertanks:				
• Engine room	none	none	one	one
• Cargo length area	none	one	two (1)	half, minimum 2 (1)
• If no tanks in cargo length area, additional fuel tank(s) outside of Engine room (if fitted)	none	one	one	two
Lubricating oil tanks	none	none	none	one
Cargo tanks	all	all	all	all
Storage tanks for fuel for auxiliary vehicles covered by Pt C, Ch 4, Sec 11.	none	none	one	one
<p>(1) One deep tank is to be included, if fitted.  <b>Note 1:</b> Independent non-structural tanks are to be surveyed according to [3.5.9].  <b>Note 2:</b> The extent of the survey of tanks dedicated to liquids other than those indicated in this table will be considered by the Society on a case by case basis according to the nature of the liquids.  <b>Note 3:</b> If a selection of tanks is accepted to be examined, then different tanks are to be examined at each class renewal survey, on a rotational basis. Tanks not internally examined may be examined externally from accessible boundaries.</p>				

**2.5.6** Non-structural storage tanks for fuel for auxiliary vehicles covered by Pt C, Ch 4, Sec 11, are to be externally examined; the relevant fittings, with particular regard to the remote-control shut-off valves under hydrostatic head, are to be externally examined and operationally tested to check that they are working properly and to verify the absence of cracks or leakage.

**2.6 Thickness measurements**

**2.6.1** Thickness measurements are to be carried out according to the procedure detailed in Ch 2, Sec 2, [2.3].  
 The extent of thickness measurements is detailed in Tab 3, according to the age of the ship. The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine areas of substantial corrosion in accordance with the requirements of Tab 4. These extended thickness measurements are to be carried out before the survey is credited as completed.  
 Thickness measurements locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.  
 Thickness measurements of internals may be specially considered by the Surveyor if the hard protective coating is in good condition.

**2.7 Independent cargo tanks**

- 2.7.1** All independent cargo tanks are to be cleaned and examined internally, as well as their liquid-level indicators.
- 2.7.2** When accessible, the outer surface of uninsulated cargo tanks or the outer surface of cargo tank insulation is to be examined.  
 Special attention is to be given to the tank and insulation in way of chocks, supports, keys, anti-rolling/pitching systems.  
 Removal of insulation, in part or entirely, may be required in order to verify the condition of the tank or the insulation itself if deemed necessary by the Surveyor.
- 2.7.3** Thickness measurements may be required if deemed necessary by the Surveyor.
- 2.7.4** The tightness of all cargo tanks is to be verified by an appropriate procedure.
- 2.7.5** The pressure relief valves for the cargo tanks are to be opened for examination, adjusted, function tested and sealed. Where a proper record of continuous overhaul and re-testing of individually identifiable relief valves is maintained, consideration may be given to acceptance on the basis of opening, internal examination and testing of a representative sample of valves, including each size and type of relief valves in use, provided there is evidence in the log-book that the remaining valves have been overhauled and tested since crediting of the previous class renewal survey.
- 2.7.6** The cargo containment venting system is to be examined.

**Table 3 : Requirements for thickness measurements at class renewal survey**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
Suspect areas throughout the vessel	Suspect areas throughout the vessel	Suspect areas throughout the vessel	Suspect areas throughout the vessel
	One transverse section of deck plating within the amidships 0,5 L (in way of a cargo space, if applicable)	Two transverse sections within the amidships 0,5L (in way of two cargo spaces, if applicable) <b>(2)</b>	A minimum of three transverse sections within the amidships 0,5L (in way of cargo spaces, if applicable) <b>(2)</b>
		All cargo hold hatch covers and coamings <b>(1)</b>	
		Internals in fore peak and after peak ballast tanks	
			All exposed main deck plating full length.
			Representative exposed superstructure deck plating (poop, bridge, and forecastle deck).
			Lowest strake and strakes in way of 'tween decks of all transverse bulkheads in cargo spaces together with internals in way.
			All wind – and water strakes, port and starboard, full length.
			All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space, and aft end of tanks.
			Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending surveyor
<p><b>(1)</b> Including plates and stiffeners.</p> <p><b>(2)</b> For ships less than 100 m in length, the number of transverse sections required when the ship's age is between 10 and 15 years may be reduced to one and the number of transverse sections required at subsequent class renewal surveys may be reduced to two. For ships more than 100 m in length, when the ship's age is between 10 and 15 years, thickness measurements of exposed deck plating within amidship 0,5 L may be required.</p> <p><b>Note 1:</b> Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, thickness measurement is to be done of the accessible parts of hatch cover structures.</p>			

**Table 4 : Guidance for additional thickness measurements in way of substantial corrosion areas**

Structural member	Extent of measurements	Pattern of measurements
Plating	Suspect area and adjacent plates	5 point pattern over 1 square metre
Stiffeners	Suspect area	3 measurements each in line across web and flange

**2.7.7** All piping, equipment and machinery for loading, venting, heating or otherwise handling the cargo are to be examined. Insulation is to be removed as deemed necessary to ascertain the condition of the pipes.

If the visual examination raises doubts as to the integrity of the pipelines, a pressure test at 1,25 times the MARVS for the pipeline is to be carried out. After reassembly the complete piping systems are to be tested for leaks.

**2.7.8** All emergency shutdown and quick-closing valves in the cargo piping systems are to be examined and proven operable. A random selection of valves is to be opened up for examination.

**2.7.9** Holds around cargo tanks are to be internally examined. In case of ships built without longitudinal bulkhead in the centre line of the ship, and fitted with long deck beams, the welded connections between the deck beams and the plating of the double hull spaces are to be thoroughly examined.

### 3 Machinery and systems

#### 3.1 General

**3.1.1** The survey items listed below are to be covered to the satisfaction of the Surveyor. However, other survey alternatives deemed equivalent by the Surveyor in relation to the characteristics and general condition of the ship concerned may also be accepted.

As part of the Class Renewal Survey of Machinery, a dock trial is to be carried out, to the satisfaction of the attending Surveyor, to confirm satisfactory operation of main and auxiliary machinery. If significant repairs are carried out to main or auxiliary machinery or steering gear, consideration is to be given to a sea trial, to the satisfaction of the attending Surveyor.

If the significant repairs as stated above, is considered by the Society to have any impact on response characteristics of the propulsion systems, then the scope of sea trial shall also include a test plan for astern response characteristics based on those required for such an equipment or system when fitted to the new ship. Refer to Pt C, Ch 1, Sec 18, [3.3.2] for astern testing requirements.

The tests are to demonstrate the satisfactory operation of the equipment or system under realistic service conditions at least over the manoeuvring range of the propulsion plant, for both ahead and astern directions.

Depending on the actual extent of the repair, the Society may accept a reduction of the test plan.

Note 1: Attention is drawn to the requirement Ch 2, Sec 2, [2.5.1] regarding safe execution of surveys, in particular as regards health hazards related to asbestos.

## **3.2 Main and auxiliary engines and turbines**

### **3.2.1 General**

Depending on the type of machinery, the following parts are to be opened up as necessary for inspection, unless surveyed in accordance with Ch 2, Sec 2, [4.3.6], items e) and f). Parts and components are to be pressure tested as appropriate or as deemed necessary by the Surveyor. A working test is also to be carried out, including testing of alarms and safety devices.

### **3.2.2 Internal combustion engines**

- a) Columns and entablature
- b) Cylinders with their liners, cylinder covers (together with valves and valve gear), pistons with their rods, crossheads, slippers and guides (or gudgeon pins), connecting rods (with their top and bottom end bearings), control gear, driven scavenge pumps, driven air compressors, driven fuel pumps, supercharging blowers, fuel injection pumps, turning gear, etc.
- c) Crankshafts (together with their main bearings)
- d) Reverse gear, reduction gear and clutches, if fitted.

### **3.2.3 Steam turbines**

- a) Condensers and their cooling water and condensate extraction pumps
- b) Casings and rotors (including their blading), impulse wheels (including guide blading and diaphragms), nozzles and nozzle boxes, journals and bearings, dummy pistons, labyrinths, external glands, etc.
- c) Shafts, including their flexible couplings.

Where the propulsion steam turbines are of a well-known type, and fitted with rotor position indicators and vibration indicators of an approved type, as well as measuring equipment of steam pressure at proper locations along the steam flow, and the arrangements for change-over in the event of emergency operation of the plant are readily operable, the first class renewal survey may be limited to the examination of rotor bearings, thrust bearings and flexible couplings, provided the Surveyor is satisfied from operation service records and power trials subsequent to the survey, that the turbine plant is in good working condition.

### **3.2.4 Gas turbines**

- a) Casings, rotors and disks, impellers and blading of all turbines and compressors, combustion chambers, burners, heat exchangers, gas piping, compressed air piping with fittings, starting and reverse arrangements
- b) Shafts and their flexible couplings.

### **3.2.5 Electric propulsion**

Where the propulsion machinery consists of an electrical system, the propulsion motors, generators, cables and all ancillary electrical gear, exciters and ventilating plant (including coolers) associated therewith are to be examined and the insulation resistance to earth tested. Due attention is to be given to windings, commutations and sliprings. The operation of protective gear and alarm devices is to be checked, as far as practicable. Interlocks intended to prevent unsafe operations or unauthorised access are to be checked to verify that they are functioning correctly.

### **3.2.6 Thruster installations**

When the ship is equipped with thruster installations, the class renewal survey is also to include:

- an examination of the machinery and electrical installation, as applicable
- an external examination of the propulsive part of the installation to be carried out at the dry dock survey due as part of the class renewal survey. During this examination other checks such as clearance readings, tightness of hub and blade sealing for controllable pitch propellers are to be verified. Locking arrangements for bolts, if fitted, are to be checked. Results of lubricating oil analysis to detect possible deterioration of internal gears and bearings or the presence of water are to be confirmed as acceptable. The Manufacturer's requirements may be taken into account. Dismantling of the assembly for the examination of internal parts may be required if the foregoing checks are not satisfactory
- a running test of the system under operating conditions.

### **3.2.7 Pod propulsion systems**

When the ship is equipped with pod propulsion systems, the class renewal survey is to include the examination of:

- electric propulsion motors and associated equipment, see [3.2.5]
- pod orientation device (gears and wheels, hydraulic/ electric system, sealing arrangements)
- oil lubricating system of shaft bearings
- bilge system inside pod
- ventilation and cooling system
- rotating commutator
- alarm system.

### **3.3 Reduction gears, main thrust and intermediate shaft(s)**

**3.3.1** Reduction gears complete with all wheels, pinions, shafts, couplings, bearings and gear teeth, including incorporated clutch arrangements, are to be opened up, as deemed necessary by the Surveyor, for visual inspection. For complicated assemblies, gears and roller bearings may be surveyed without dismantling.

**3.3.2** All shafts, thrust blocks and bearings are to be examined.

### **3.4 Pumps and other machinery items**

#### **3.4.1 General**

The items listed in [3.4.2] are to be opened up, as deemed necessary by the Surveyor, for visual inspection. Their parts and components are to be pressure tested as appropriate and considered necessary by the Surveyor. A working test is also to be carried out, including testing of alarms and safety devices if deemed necessary by the Surveyor.

#### **3.4.2 Items to be surveyed**

- a) Air compressors with their intercoolers, filters and/or oil separators and safety devices
- b) Heat exchangers, ventilation fans for boilers and other equipment used for essential services
- c) Piston pumps and centrifugal pumps for sea water, bilge and salt water ballast
- d) Screw pumps, gear pumps and centrifugal pumps other than those listed in c) above (opening up is not required).

### **3.5 Systems in machinery spaces**

**3.5.1** Valves, cocks and strainers of the bilge and ballast systems are to be opened up, as deemed necessary by the Surveyor, for visual inspection, and, together with the piping and safety devices, examined and tested under working conditions.

**3.5.2** The fuel oil, lubricating oil, hydraulic oil, thermal oil, and feed and cooling water systems, together with pressure filters, heaters and coolers used for essential services, are to be opened up and examined or tested, as considered necessary by the Surveyor. Safety devices for the foregoing items are to be examined.

**3.5.3** The compressed air system together with its valves, fittings and safety devices is to be examined, as considered necessary by the Surveyor.

**3.5.4** Compressed air receivers and other pressure vessels for essential services are to be cleaned internally and examined internally and externally. Their fittings, valves and safety devices are to be opened up, as deemed necessary by the Surveyor, for visual inspection and pressure tested as appropriate.

**3.5.5** Steel pipes for superheated steam having a temperature of the steam at the superheater outlet exceeding 450°C are to be examined and tested in accordance with [3.5.7] to [3.5.8] at each class renewal survey.

**3.5.6** Steel pipes for saturated steam or superheated steam having a temperature of the steam at the superheater outlet not exceeding 450°C are to be examined and tested in accordance with [3.5.7] to [3.5.8] at each class renewal survey for ships over 5 years of age. When the ship is 5 years of age or less, the inspection may be limited to a check of the satisfactory general condition of pipes.

**3.5.7** The examination and hydrostatic test of steel pipes for main steam machinery, and steel pipes for auxiliary steam machinery having internal diameter 75 mm and over, are to be carried out on a number of pipes selected by the Surveyor after the lagging in way is removed.

**3.5.8** Representative pipe lengths connected with bolted flanges are to be internally and externally examined, and hydrostatically tested to 1,1 times the working pressure at ambient temperature. Bolts and butt-welded joints between flanges and pipes are to be submitted to a non-destructive test for crack detection.

**3.5.9** Non-structural tanks located in machinery spaces are to be externally examined; the relevant fittings, with particular regard to the remote control shut-off valves under hydrostatic head, are to be externally examined and operationally tested to check that they are working properly and to verify the absence of cracks or leakage.

**3.5.10** When the ship is equipped with a refrigerating plant (whether or not covered by an additional class notation), the class renewal survey is to include:

- examination and test at the design pressure of the parts of the plant under pressure
- for refrigerating machinery spaces using ammonia as refrigerant:
  - examination and test of the water-spraying fire-extinguishing system to the same extent as indicated in [3.8.3], item d)
  - examination of valves and pumps of the bilge system to the same extent as indicated in [3.4]
  - examination and test of the electrical equipment to the same extent as indicated in [3.6.11]
  - test of the gas detection system.

**3.5.11** When the ship is equipped with a ballast water treatment system using an inert gas generator and where this inert gas generator is used solely for the purpose of ballast water treatment, the class renewal survey is to include the relevant items of Ch 4, Sec 3, [7.3].

### **3.6 Electrical equipment and installations**

**3.6.1** An electrical insulation resistance test is to be performed on the electrical equipment and cables. If needed, for the purpose of this test, the installation may be subdivided or equipment which may be damaged disconnected.

**3.6.2** The following minimum values, when performing the insulation test, are to be considered:

- for main and emergency switchboards, feeder circuit breakers being open, busbar circuit closed, measuring and monitoring instruments disconnected, the resistance of insulation measured across each insulated busbar and the hull, and across insulated busbars, should not be less than 1 megohm
- for generators, the equipment and circuits normally connected between the generator and the first circuit breaker being connected, the resistance of insulation (preferably at working temperature whenever possible), in ohms, is to be greater than 1 000 times the rated voltage, in volts. If appropriate, the Surveyor checks also that the insulation resistance of generators separate exciter gear is not less than 1 megohm
- the insulation resistance of the entire electrical system is to be checked with all circuit breakers and protective devices closed, except for generators; in general, the resistance should not be less than 100 000 ohms. However, the variation of the resistance with time is to be checked, comparing the current figure with previous readings. If the insulation resistance was to drop suddenly or be insufficient, the defective circuits are to be traced, disconnecting the circuits as much as necessary.

**3.6.3** The prime movers of generators are to be surveyed in accordance with [3.2] and their governors tested. All generators are to be presented for inspection, clean and with covers opened and examined under working conditions.

**3.6.4** Main and emergency switchboards, section boards and distribution boards are to be cleaned and doors or covers opened for examination of their fittings. The condition of overcurrent protective devices and fuses is to be checked. Circuit-breakers of generators are to be tested, as far as practicable, to verify that protective devices including preference tripping relays, if fitted, operate satisfactorily. It is to be verified that there are no loose connections on busbar.

**3.6.5** Electrical cables and cable runs are to be examined at random, in particular in places where deterioration is likely to occur; terminal boxes of essential services are also to be subjected to a random check.

**3.6.6** The motors and starters concerning essential services together with associated control and switchgear are to be examined and, if considered necessary by the Surveyor, checked, as far as practicable, under working conditions.

**3.6.7** Navigation light indicators are to be tested under working conditions, and correct operation on the failure of supply or failure of navigation lights verified.

**3.6.8** The emergency sources of electrical power, their automatic arrangements and associated circuits are to be tested.

**3.6.9** Emergency lighting, transitional emergency lighting, supplementary emergency lighting, general emergency alarm and public address systems are to be tested as far as practicable.

**3.6.10** The visible condition of electrical equipment and installations is also to be checked as regards precautions against shock, fire and other hazards of electrical origin.

**3.6.11** A general examination of the electrical equipment in areas where there may be flammable gas or vapour and/or combustible dust is to be carried out to ensure that the integrity of the electrical equipment of a safety type has not been impaired owing to corrosion, missing bolts, etc., and that there is not an excessive build-up of dust on or in dust-protected electrical equipment. Cable runs are to be examined for sheath and armouring defects, where practicable, and to ensure that the means of supporting the cables are in satisfactory condition. The proper condition of bonding straps for the control of static electricity is to be checked. Alarms and interlocks associated with pressurised equipment or spaces are to be tested for correct operation.

Note 1: Owners are reminded that maintenance, repairs or renewal of certified electrical equipment of a safe type remains their responsibility or that of their representatives.

**3.6.12** The survey is also to cover the computerized systems through the control of the Software Registry as mentioned in Pt C, Ch 3, Sec 3. This survey shall include:

- checking of modification of Software Registry, in particular the reporting of security checks during software modification inside the Software Registry
- checking that revision of software mentioned in Software Registry corresponds with revision effectively used for each computerized system
- checking that Software Registry has been updated according to the last ship relevant modifications.

**3.6.13** For ships where the electrical distribution system includes harmonic filters, the survey is to include:

- annual measurement, as a minimum, of the harmonic distortion levels of main busbars under seagoing conditions as close to the periodical machinery survey as possible so as to give a clear representation of the condition of the entire plant to the surveyor. Harmonic distortion readings are to be carried out when the greatest amount of distortion is indicated by the measuring equipment. An entry showing which equipment was running and/or filters in service is to be recorded in the log so this can be replicated for the next periodical survey. Harmonic distortion levels are also to be measured following any modification to the ship's electrical distribution system or associated consumers by suitably trained ship's personnel or by a qualified outside source.
- verification that records of all above measurements are made available to the surveyor at each periodical survey.

Note 1: Those requirements apply at any scheduled machinery periodical survey having a due date on or after 1<sup>st</sup> July 2017 for ships contracted for construction before 1<sup>st</sup> July 2017.

- for ships contracted for construction on or after 1<sup>st</sup> July 2017, verification that the facilities used for continuous monitoring of the levels of harmonic distortion experienced on the main busbars as well as alerting the crew when the level of harmonic distortion exceeds the acceptable limits are working properly and review of corresponding records.

**3.6.14** For Li-Ion batteries of a capacity above 20kWh or used as emergency source or transitional source, the requirements given in Ch 3, Sec 1, [3.3.5] for annual survey are to be complied with.

In addition:

- a comprehensive test of indication and alarms is to be carried out
- the traceability of cells replacement is to be checked
- the traceability of software modification is to be checked
- a battery capacity (State of Health - SOH) test is to be witnessed when:
  - release of flammable or toxic gases during battery operation was identified
  - loss of battery might jeopardize the manoeuvrability of the ship.

**3.6.15** For batteries used for electrical supply of pods, the requirements given in Ch 3, Sec 1, [3.3.6] for annual survey are to be complied with.

In addition the class renewal survey is to include:

- verification of the quality of the power supply
- examination of the fire-extinguishing system as applicable in accordance with the relevant requirements given in [3.8].

## **3.7 Controls**

**3.7.1** Where remote and/or automatic controls, not covered by an additional class notation related to automated installation, are fitted for essential machinery, they are to be tested to demonstrate that they are in satisfactory condition.

## **3.8 Fire protection, detection and extinction**

**3.8.1** The Owner or his representative is to declare to the attending Surveyor that no significant changes have been made to the arrangement of structural fire protection.

Note 1: Attention is drawn to the provisions of Ch 1, Sec 1, [3.1.1] regarding compliance with any additional and/or more stringent requirements issued by the Administration of the State whose flag the ship is entitled to fly.

**3.8.2** The class renewal survey of fire prevention arrangements is to cover the following items.

- a) Visible parts of items forming part of structural fire protection arrangements in accommodation spaces and in machinery spaces such as bulkheads, decks, doors, stairways, crew and service lift trunks, and light and air trunks are to be examined, due attention being given to their integrity and that of the insulating material.
- b) The operation of manual/automatic fire doors, where fitted, is to be checked.
- c) Remote controls for stopping fans and machinery and shutting off fuel supplies in machinery spaces and, where fitted, remote controls for stopping fans in accommodation spaces and means of automatically shutting off the electrical power of the deep-fat cooking equipment upon activation of the fire-extinguishing system are to be tested.
- d) Closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnels, where applicable, are to be tested.
- e) Fire and/or smoke detection and alarm systems are to be tested.

**3.8.3** The survey requirements for all types of fire-fighting systems that are usually found on board ships related either to machinery spaces or to cargo areas and/or spaces or to accommodation spaces, irrespective of the service notation assigned, are the following:

- a) water fire system
  - the associated pumps are to be opened up and examined at the Surveyor's discretion
  - the fire main is to be hydrostatically tested to the working pressure at the Surveyor's discretion

b) fixed gas fire-extinguishing system

Receivers of CO<sub>2</sub> (or other gas) fixed fire-extinguishing systems are to be externally examined together with all stationary fittings and devices. In addition, the following applies:

- the total loss of CO<sub>2</sub> is not to exceed 10% of the installed quantity (5% for Halon)
- after being repaired or discharged, containers are to be subjected to a hydrostatic test
- hydrostatic testing of high pressure CO<sub>2</sub> containers is to be carried out at intervals not exceeding 10 years; the number of the tested containers is to be not less than 10% of the total number
- low pressure CO<sub>2</sub> containers are to be internally surveyed if the content has been released and the container is older than five years; depending upon the result of the internal examination, the Surveyor may require the container to be hydrostatically tested.

It is to be checked that the distribution pipework is proved clear.

c) sprinkler system

- the associated pumps are to be opened up and examined at the Surveyor's discretion

d) water spraying system

- the associated pumps are to be opened up and examined at the Surveyor's discretion
- a working test is to be carried out as far as reasonable and appropriate

e) fixed foam systems (low or high expansion)

- the associated pumps are to be opened up and examined at the Surveyor's discretion

f) dry powder system

- it is to be verified that the propelling inert gas bottles have been hydrostatically tested. The same applies to bottles disembarked for refilling or embarked for replacement.

**3.8.4** As far as other fire-fighting equipment is concerned, the following items are to be hydrostatically tested, at intervals not exceeding 10 years:

- any CO<sub>2</sub> bottles of extinguishers
- shells of foam extinguishers
- shells of powder extinguishers
- air or gas bottles associated with fire extinguishers whose shells are not kept under pressure (if internally examined, the test need not be performed).

**3.8.5** Where a helideck is fitted, the following is to be checked, as far as appropriate:

- drainage arrangements around the landing area
- fire fighting appliances and arrangements (to be surveyed as per [3.8.3] and [3.8.4], according to the equipment installed)
- other arrangements for helicopter refuelling and hangar facilities (fuel system, ventilation, fire protection and detection).

### **3.9 Hold, ballast and dry spaces water level detectors**

**3.9.1** For ships subject to compliance with the requirements laid down in Ch 6, Sec 2, [6], or in Ch 6, Sec 4, [2], or in Pt B, Ch 2, Sec 1, [2.2], the class renewal survey is to include an examination and a test of the water ingress detection systems and of their alarms.

### **3.10 Availability of pumping systems**

**3.10.1** For ships subject to compliance with the requirements laid down in Ch 6, Sec 2, [7], or in Pt C, Ch 1, Sec 10, [6.6.3], item e), the class renewal survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, and of their controls.

## Section 4 Bottom Survey

### 1 General

#### 1.1

**1.1.1** Examinations of the outside of ship's bottom and related items of ships is normally to be carried out with the ship in dry-dock or on a slipway. However, consideration may be given to alternate examination while the ship is afloat as an in-water survey, subject to provisions of Ch 2, Sec 2, [5.4] and [3] of this Section.

Note 1: for ships assigned with the service notation **yacht** or **charter yacht**, reference is made to the Rule Note NR500, Rules for the Classification and Certification of Yachts.

### 2 Bottom survey in dry condition

#### 2.1 General requirements

**2.1.1** When a ship is in dry-dock or on a slipway, it is to be placed on blocks of sufficient height and with the necessary staging to permit the examination of elements such as shell plating including bottom and bow plating, stern frame and rudder, sea chests and valves, propeller.

**2.1.2** The shell plating is to be examined for excessive corrosion, or deterioration due to chafing or contact with the ground or for any undue unfairness or buckling. Special attention is to be paid to the connection between the bilge strakes and the bilge keels and to the plating of end structures (stem and sternframes). Important plate unfairness or other deterioration which do not necessitate immediate repairs are to be recorded.

**2.1.3** Sea chests and their gratings, sea connections and overboard discharge valves and cocks and their fastenings to the hull or sea chests are to be examined. Sea valves and cocks need not be opened up more than once in a period of class unless considered necessary by the Surveyor.

For ships fitted with box coolers (chest coolers), the connection between the box cooler and the sea chest top plate are to be specifically examined from both sea side and inside (dry side) at bottom survey in drydock only.

**2.1.4** Visible parts of the propeller(s), stern bush(es), propeller shaft boss, brackets and tightness system(s) are to be examined. The clearances of the propeller shaft(s) (or wear gauge) are to be checked and recorded. For controllable pitch propellers, the Surveyor is to be satisfied with the fastenings and tightness of hub and blade sealing.

Visible parts of side thrusters are to be examined. Other propulsion systems which also have manoeuvring characteristics (such as directional propellers, vertical axis propellers, water jet units) are to be examined externally with focus on the condition of gear housing, propeller blades, bolt locking and other fastening arrangements. Sealing arrangement of propeller blades, propeller shaft and steering column shall be verified.

Note 1: For the survey of propeller shafts, refer to Ch 3, Sec 5.

Dismantling is to be carried out, if considered necessary, notably where leakages are detected.

**2.1.5** Visible parts of the rudder(s), rudder pintles, rudder stock and couplings as well as the sternframe are to be examined. If considered necessary by the Surveyor, the rudder(s) is (are) to be lifted or the inspection plates removed for the examination of pintles.

The clearances in the rudder bearings and the rudder lowering are to be checked and recorded.

Where applicable, pressure test of the rudder may be required as deemed necessary by the Surveyor.

#### 2.2 Bottom survey held within the scope of class renewal survey

**2.2.1** The examination and checks detailed in Ch 3, Sec 3, [2.1] are to be carried out as part of the class renewal survey. They are usually carried out during the bottom survey held concurrently with the class renewal survey.

### 3 Bottom in-water survey

#### 3.1 General

**3.1.1** An in-water survey may normally be carried out if the ship has been granted the additional class notation **INWATERSURVEY** as defined in Ch 1, Sec 2, [6.25.1]. Upon application by the Owner, the Society may also authorise, on a case-by-case basis, such bottom in-water survey for ships not assigned with the additional class notation **INWATERSURVEY**.

**3.1.2** In principle, no outstanding conditions of class are to exist requiring repair work to be carried out to the underwater part of the shell plating, the rudder, the propeller or the propeller shaft, unless the Society is satisfied that such repairs may be carried out while the ship is afloat.

**3.1.3** Proposals for in-water survey are to be submitted in advance of the survey by the Owner so that satisfactory arrangements can be agreed with the Society.

The in-water survey is to be carried out with the ship in sheltered water and preferably with weak tidal streams and currents. The in-water visibility and the cleanliness of the hull below the waterline are to be clear enough to permit a meaningful examination allowing the Surveyor and the in-water survey firm to determine the condition of the plating, the appendages and the welding.

The equipment, procedure for observing and reporting the survey are to be discussed with the parties involved prior to the in-water survey, and suitable time is to be allowed to permit the in-water survey firm to test all equipment beforehand.

**3.1.4** The in-water survey is to be carried out under the surveillance of a Surveyor by an in-water survey firm approved as a service supplier by the Society according to Ch 2, Sec 2, [2.4].

The Surveyor is to be satisfied with the methods of orientation of the diver(s) or remotely operated vehicle (ROV) on the plating, which should make use where necessary of permanent markings on the plating at selected points and with the method of pictorial representation. An efficient two-way communication between the Surveyor and the diver(s) is to be provided.

**3.1.5** The in-water survey is to provide the information normally obtained from a bottom survey in dry condition. Special consideration shall be given to ascertaining rudder bearing clearances and stern bush clearances of oil stern bearings based on a review of the operating history, on board testing and stern oil sample reports. These considerations are to be included in the proposals for in-water survey as required in [3.1.3].

Upon completion of the survey, the approved diving firm is to submit to the attending Society Surveyor a detailed report including video tapes, as well as a photographic documentation of the main parts inspected.

**3.1.6** If the in-water survey reveals damage or deterioration that requires immediate attention, the Surveyor may require that the ship be drydocked in order that a detailed survey can be undertaken and the necessary repairs carried out.

# Section 5 Tailshaft Survey

## 1 Survey of tailshafts

### 1.1 General

**1.1.1** The different types of surveys to which tailshafts may be subjected and the intervals at which they are to be carried out are given in Ch 2, Sec 2, [5.5]. These surveys are:

- complete survey
- modified survey.

The requirements to be complied with at each survey are listed in [1.2] and [1.3].

### 1.2 Complete survey

**1.2.1** The complete survey of tailshafts consists of the following, as applicable:

- a) removal of propeller and key, where fitted, and their examination

Note 1: Where the propeller is fitted keyless to the shaft taper and where the additional class notation **MON-SHAFT** has been assigned, refer to item c), Note 3.

- b) complete withdrawal of shaft to permit the examination of sterntube bearings (outboard or inboard depending on the type of shaft)
- c) examination by an appropriate crack detection method of the after end of the cylindrical part of the shaft and forward one third of shaft cone, or the fillet of the flange in the case of a flanged coupling

Note 2: Refer also to Ch 2, Sec 2, [5.5.2], item b) where the crack detection test of the aft flange fillet area may be dispensed with for the solid flange couplings fitted at the end of the shaft.

Note 3: Refer also to Ch 2, Sec 2, [5.5.2], item b) where the propeller is fitted keyless to the shaft taper, and, where the additional class notation **MON-SHAFT** has been assigned, the non-destructive examination is carried out at intervals not exceeding 15 years.

- d) examination of shaft bearing surfaces, liners, joints, threaded end and nut
- e) examination of oil sealing glands with the necessary dismantling
- f) measurements of clearances and/or wear (prior to and after the survey) and their recording
- g) opening-up of controllable pitch propellers and examination of their working parts and control gear, if considered necessary.

**1.2.2** Where the notation **MON-SHAFT** has been assigned as specified in Ch 1, Sec 2, [6.6.3], the tailshaft need not be withdrawn at the complete survey and items b) and d) of [1.2.1] need not be covered provided that all condition monitoring data (aft bearing temperature, consumption and analysis of lubricating oil) is found to be within permissible limits and the remaining requirements for the complete survey are complied with.

Where the Surveyor considers that the data presented is not entirely to his satisfaction, the shaft is to be withdrawn.

### 1.3 Modified survey

**1.3.1** A modified survey may be carried out for those tailshafts which fulfil the conditions described in Ch 2, Sec 2, [5.5.3], where the periodicity of this type of survey is also shown.

The modified survey of water lubricated systems is eligible under the condition that the additional class notation **MON-SHAFT** has been assigned as specified in Ch 1, Sec 2, [6.6.3].

#### 1.3.2 General

For the different types of shafts, the following is required:

- a) for shafts with keyed propeller coupling:
- removal of propeller and key, and their examination in way of the connection area
  - examination by an appropriate crack detection method of the after end of the cylindrical part of shaft and forward one third of shaft cone
- b) for shafts with keyless type propeller coupling:
- check of the tightness of the propeller hub (propeller hood, fore gland)
- c) for shafts with a solid flange coupling at the aft end and variable pitch propeller:
- check of tightness in way of blade glands and distribution box
  - check of analysis of hydraulic oil
  - working test, as far as practicable, of the blade manoeuvring.

**1.3.3** See also Ch 2, Sec 2, [5.5.3] and Ch 5, Sec 6, [3], as relevant.

**1.3.4** Where the Surveyor considers that the data presented is not entirely to his satisfaction, further dismantling may be required, including withdrawal of the tailshaft.

## **2 Periodical survey of other propulsion systems**

### **2.1 Rotating and azimuth thrusters**

**2.1.1** The periodical survey of rotating and azimuth thrusters consists of:

- a) removing the propeller(s) in order to examine the following items, as applicable:
  - exposed parts
  - cone and keyway to be checked by an appropriate crack detection method
  - sealing glands
  - threaded end and nut
- b) examining the results of a lubricating oil analysis (water content and presence of material particles) to detect possible deterioration of internal gears and bearings
- c) examining the orientation device.

If the foregoing checks are not satisfactory, dismantling of the internal parts may be required.

### **2.2 Vertical axis propellers**

**2.2.1** The periodical survey of vertical axis propeller systems consists of:

- checking the tightness of the oil glands and the backlash of the gears from outside by action on the blades
- checking the condition of gears and couplings from inside the ship
- examining the results of a lubricating oil analysis (water content and presence of material particles) to detect possible deterioration of internal gears and bearings.

If the foregoing checks are not satisfactory, dismantling of the internal parts may be required.

### **2.3 Pump jet systems**

**2.3.1** The periodical survey of pump jet systems consists of examining the following parts:

- impeller, shaft and clearances of bearings
- tightness of gland
- water duct
- steering nozzle
- reversing arrangements and control gear.

If the foregoing checks are not satisfactory, further dismantling may be required.

### **2.4 Pod propulsion systems**

**2.4.1** The scope of complete and - where applicable- modified survey of the pod propulsion system shafting arrangement is the one detailed in [1.2] and [1.3] for tailshafts.

**2.4.2** Where the system is fitted with:

- a vibration monitoring of roll bearings
- a temperature monitoring of bearings, and
- a monitoring of automatic bilge pumping system,

the shaft need not be withdrawn at the complete survey and items b) and d) of [1.2.1] need not be covered provided that all condition monitoring data (vibrations and temperatures in way of bearings, consumption and analysis of lubricating oil, running rate of bilge system) are found to be within permissible limits and the remaining requirements for the complete survey are complied with.

Where the Surveyor considers that the data presented is not to his satisfaction, further dismantling are to be required.

### 3 Survey of propeller shafts and tube shafts

#### 3.1 General

##### 3.1.1 Application

Unless alternative means are provided to assure the condition of the propeller shaft assembly, these requirements apply to all ships with conventional shafting fitted with a propeller, as follows:

- from 1 January 2016, for ships delivered on or after 1 January 2016
- after the first shaft survey scheduled on or after 1 January 2016, for ships delivered before 1 January 2016.

Note 1: Note 1: Upon the completion of the first shaft survey scheduled on or after 1 January 2016, the designation of dates for the next shaft survey is to be made based upon the requirements of this Article.

##### 3.1.2 Definitions

See also Fig 1.

a) Shaft

For the purpose of this Article, shaft is a general definition that includes:

- propeller shaft
- tube shaft.

The definition does not include the intermediate shafts which are considered as part of the propulsion shafting inside the ship.

b) Propeller shaft

Propeller shaft is the part of the propulsion shaft to which the propeller is fitted. It may also be called screwshaft or tailshaft.

c) Tube shaft

Tube shaft is a shaft placed between the intermediate shaft and the propeller shaft, normally arranged within a stern tube or running in open water. It may also be called sterntube shaft.

d) Sterntube

Tube or pipe fitted in the shell of a ship at the stern (or rear part of the ship), below the waterline, through which passes the tube shaft or the aftermost section of the propeller shaft.

Sterntube is the housing of the shaft bearings, generally two (one aft and one fore), that sustain the shaft and allow its rotation with less frictional resistance. The sterntube also accommodates the shaft sealing arrangement.

e) Closed loop (system) oil lubricated bearing

Closed loop oil lubricating systems use oil to lubricate the bearings and are sealed against the environment (seawater) by adequate sealing/gland devices.

f) Water lubricated bearing

Water lubricated bearings are bearings cooled/lubricated by water (fresh or salt).

g) Closed loop (system) fresh water lubricated bearing

Closed loop water lubricating systems use fresh water to lubricate the bearings and are sealed against the environment (such as seawater) by adequate sealing/gland devices.

h) Open systems (water)

Open water lubricating systems use water to lubricate the bearings and are exposed to the environment.

i) Adequate means for protection against corrosion

An adequate means for protection against corrosion is an approved means for full protection of the core shaft against sea water intrusion and subsequent corrosion attack. Such means are used for the protection of common steel material against corrosion, particularly in combination with water lubricated bearings.

Typical means are, for example:

- continuous metallic, corrosion resistant liners
- continuous cladding
- multiple layer synthetic coating
- multiple layer of fibreglass
- combinations of above mentioned
- rubber/elastomer covering coating.

The means for protection against corrosion are installed/ applied according to class approved procedures.

j) Corrosion resistant shaft

Corrosion resistant shaft is made in approved corrosion resistant steel as core material for the shaft.

k) Sterntube sealing system

Sterntube sealing system is the equipment installed on the inboard extremity and, for closed systems, at outboard extremity of the sterntube.

Inboard seal is the device fitted on the fore part of the sterntube that achieves the sealing against the possible leakage of the lubricant media into the ship internal.

Outboard seal is the device fitted on the aft part of the sterntube that achieves the sealing against the possible sea water ingress and the leakage of the lubricant media.

l) Service records

Service records are regularly recorded data showing in-service conditions of the shaft(s) and may include, as applicable: lubricating oil temperature, bearing temperature and oil consumption records (for oil lubricated bearings) or water flow, water temperature, salinity, pH, make-up water and water pressure (for closed loop fresh water lubricated bearings, depending on the design).

m) Oil sample examination

Oil sample examination is a visual examination of the sterntube lubricating oil taken in the presence of the Surveyor, with a focus on water contamination.

n) Lubricating oil analysis

Lubricating oil analysis is to be carried out at regular intervals not exceeding 6 months.

The documentation on lubricating oil analysis is to be available on board.

Oil samples, to be submitted for the analysis, should be taken under service conditions.

o) Fresh water sample test

Fresh water sample test should be carried out at regular intervals not exceeding 6 months

Samples are to be taken under service conditions and are to be representative of the water circulating within the sterntube.

Analysis results are to be retained on board and made available to the Surveyor.

At time of survey, the sample for the test is to be taken in the presence of the Surveyor.

Fresh water sample test shall include the following parameters:

- chlorides content
- pH value
- presence of bearing particles or other particles (only for laboratory analysis, not required for tests carried out in the presence of the Surveyor).

p) Keyless connection

Keyless connection is the forced coupling methodology, between the shaft and the propeller without a key, achieved through the interference fit of the propeller boss on the shaft tapered end.

q) Keyed connection

Keyed connection is the forced coupling methodology, between the shaft and the propeller with a key and a keyway, achieved through the interference fit of the propeller boss on the shaft tapered end.

r) Flanged connection

Flanged connection is the coupling methodology, between the shaft and the propeller, achieved by a flange built-in at the shaft aft end and bolted to the propeller boss.

s) Alternative means

Shafting arrangements such as, but not limited to, an approved Condition Monitoring Scheme an/or other reliable approved means for assessing and monitoring the condition of the tail shaft, bearings, sealing devices and the sterntube lubricant system capable to assure the condition of the propeller shaft assembly with an equivalent level of safety as obtained by survey methods as applicable in [3.2] or [3.3].

**Figure 1 : Typical shafting arrangement**

## **3.2 Oil lubricated shafts or closed loop system fresh water lubricated shafts (closed system)**

### **3.2.1 Shaft survey - Method 1**

The survey is to consist in:

- Drawing the shaft and examining the entire shaft, seals system and bearings
- For keyed and keyless connections:
  - removing the propeller to expose the forward end of the taper
  - performing a non-destructive examination (NDE) by an approved surface crack detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted). For shaft provided with liners, the NDE shall be extended to the after edge of the liner
- For flanged connection:

Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs, or when deemed necessary by the Surveyor, the coupling bolts and the flange radius are to be examined by means of an approved surface crack detection method
- Checking and recording the bearing clearances
- Verifying that the propeller is free of damages which may cause the propeller to be out of balance
- Verifying the satisfactory conditions of inboard and outboard seals during reinstallation of the shaft and the propeller
- Recording the bearing wear measurements (after reinstallation).

### **3.2.2 Shaft survey - Method 2**

The survey is to consist of:

- For keyed and keyless connections:
  - removing the propeller to expose the forward end of the taper
  - performing a non-destructive examination (NDE) by an approved surface crack detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted)
- For flanged connection:

Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs, or when deemed necessary by the Surveyor, the coupling bolts and the flange radius are to be examined by means of an approved surface crack detection method
- Checking and recording of the bearing wear measurements
- Visual inspection of all the accessible parts of the shafting system
- Verification that the propeller is free of damages which may cause the propeller to be out of balance
- Seal liner found to be or placed in a satisfactory condition
- Verification of the satisfactory reinstallation of the propeller, including verification of the satisfactory conditions of inboard and outboard seals.

Prerequisites, to satisfactorily verify in order to apply method 2, are the following ones:

- Review of service records
- Review of test records of:
  - lubricating oil analysis (for oil lubricated shafts), or
  - fresh water sample test (for closed system fresh water lubricated shafts)
- Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated shafts)
- Verification of no reported repairs by grinding or welding of shaft and/or propeller.

### **3.2.3 Shaft survey - Method 3**

The survey is to consist of:

- Checking and recording of the bearing wear measurements
- Visual inspection of all the accessible parts of the shafting system
- Verification that the propeller is free of damages which may cause the propeller to be out of balance
- Seal liner found to be or placed in a satisfactory condition
- Verification of the satisfactory conditions of inboard and outboard seals.

Prerequisites, to satisfactorily verify in order to apply method 3, are the following ones:

- Review of service records
- Review of test records of:
  - lubricating oil analysis (for oil lubricated shafts), or
  - fresh water sample test (for closed system fresh water lubricated shafts)
- Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated shafts)
- Verification of no reported repairs by grinding or welding of shaft and/or propeller.

### **3.2.4 Shaft extension surveys - Extension types**

a) Extension up to 2,5 years

The survey is to consist of:

- Checking and recording of the bearing wear measurements, as far as practicable
- Visual inspection of all the accessible parts of the shafting system
- Verification that the propeller is free of damages which may cause the propeller to be out of balance
- Verification of the effectiveness of the inboard seal and outboard seals.

Prerequisites, to satisfactorily verify in order to apply extension up to 2,5 years, are the following ones:

- Review of service records
- Review of test records of:
  - lubricating oil analysis (for oil lubricated shafts), or
  - fresh water sample test (for closed system fresh water lubricated shafts)
- Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated shafts)
- Verification of no reported repairs by grinding or welding of shaft and/or propeller
- Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

b) Extension up to 1 year

The survey is to consist of:

- Visual inspection of all the accessible parts of the shafting system
- Verification that the propeller is free of damages which may cause the propeller to be out of balance
- Verification of the effectiveness of the inboard seal and outboard seals.

Prerequisites, to satisfactorily verify in order to apply extension up to 1 year, are the following ones:

- Review of the previous wear and/or clearance recordings
- Review of service records
- Review of test records of:
  - lubricating oil analysis (for oil lubricated shafts), or
  - fresh water sample test (for closed system fresh water lubricated shafts)
- Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated shafts)
- Verification of no reported repairs by grinding or welding of shaft and/or propeller
- Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

c) Extension up to 3 months

The survey is to consist of:

- Visual inspection of all the accessible parts of the shafting system
- Verification of the effectiveness of the inboard seal.

Prerequisites, to satisfactorily verify in order to apply extension up to 3 month, are the following ones:

- Review of the previous wear and/or clearance recordings
- Review of service records
- Review of test records of:
  - lubricating oil analysis (for oil lubricated shafts), or
  - fresh water sample test (for closed system fresh water lubricated shafts)
- Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated shafts)
- Verification of no reported repairs by grinding or welding of shaft and/or propeller
- Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

### **3.2.5 Oil lubricated shafts**

a) Survey intervals (see Tab 1)

For surveys completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

1) Flanged propeller connection

The following methods are applicable:

- method 1 every 5 years, or
- method 2 every 5 years (prerequisites have to be fulfilled), or
- method 3 every 5 years (prerequisites have to be fulfilled).

2) Keyless propeller connection

The following methods are applicable:

- method 1 every 5 years, or
- method 2 every 5 years (prerequisites have to be fulfilled), or
- method 3 every 5 years (prerequisites have to be fulfilled).

The maximum interval between two surveys carried out according to method 1 or method 2 shall not exceed 15 years, except in the case when one extension for no more than three months is granted.

3) Keyed propeller connection

The following methods are applicable:

- method 1 every 5 years, or
- method 2 every 5 years (prerequisites have to be fulfilled).

b) Survey extensions (see Tab 1)

For all types of propeller connections, the interval between two consecutive surveys may be extended after execution of the extension survey, as follows:

- Extension up to a maximum of 2,5 years  
No more than one “2,5 year extension” can be granted. No further extension, of other type, can be granted.
- Extension up to a maximum of 1 year  
No more than two consecutive “one year extension” can be granted. In the event an additional extension is requested, the requirements of the “2,5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2,5 years.
- Extension up to a maximum of 3 months  
No more than one “three month extension” can be granted. In the event an additional extension is requested, the requirements of the “one year extension” or “2,5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year or 2,5 years.

The extension survey should normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date.

If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date the extension survey was completed.

**Table 1 : Survey intervals for oil lubricated shafts (closed systems)**

	Flanged propeller coupling	Keyless propeller coupling	Keyed propeller coupling (2)
Every five years (1)	method 1 or method 2 or method 3	method 1 or method 2 or method 3 (3)	method 1 or method 2
Extension 2,5 Y	yes (4)	yes (4)	yes (4)
Extension 1 Y	yes (5)	yes (5)	yes (5)
Extension 3 M	yes (6)	yes (6)	yes (6)

**Note 1:** For surveys (method 1, or method 2, or method 3) completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

The extension survey should normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date the extension survey was completed.

(1) Unless an extension type (extension 2,5 Y, or extension 1 Y, or extension 3 M) is applied in between.

(2) Method 3 is not allowed.

(3) The maximum interval between two surveys carried out according to method 1 or method 2 shall not exceed 15 years, except in the case when one extension for no more than three months is granted (i.e. a sequence of surveys carried out according to method 3 cannot exceed a 15-years time interval, plus possibly one extension not exceeding three months).

(4) No more than one “2,5 year extension” can be granted. No further extension, of other type, can be granted.

(5) No more than two consecutive “one year extension” can be granted. In the event an additional extension is requested, the requirements of the “2,5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2,5 years.

(6) No more than one “three month extension” can be granted. In the event an additional extension is requested, the requirements of the “one year extension” or “2,5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year or 2,5 years.

**3.2.6 Closed loop system fresh water lubricated shafts**

The maximum interval between two surveys carried out according to method 1 shall not exceed 15 years. An extension for no more than three months can be granted.

a) Survey intervals (see Tab 2)

For surveys completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

1) Flanged propeller connection

The following methods are applicable:

- method 1 every 5 years, or
- method 2 every 5 years (prerequisites have to be fulfilled), or
- method 3 every 5 years (prerequisites have to be fulfilled).

2) Keyless propeller connection

The following methods are applicable:

- method 1 every 5 years, or
- method 2 every 5 years (prerequisites have to be fulfilled), or
- method 3 every 5 years (prerequisites have to be fulfilled).

3) Keyed propeller connection

The following methods are applicable:

- method 1 every 5 years, or
- method 2 every 5 years (prerequisites have to be fulfilled).

b) Survey extensions (see Tab 2)

For all types of propeller connections, the interval between two consecutive surveys may be extended after execution of the extension survey, as follows:

- Extension up to a maximum of 2,5 years  
No more than one “2,5 year extension” can be granted. No further extension, of other type, can be granted.
- Extension up to a maximum of 1 year  
No more than two consecutive “one year extension” can be granted. In the event an additional extension is requested, the requirements of the “2,5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2,5 years.
- Extension up to a maximum of 3 months  
No more than one “three month extension” can be granted. In the event an additional extension is requested, the requirements of the “one year extension” or “2,5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year or 2,5 years.

The extension survey should normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date.

If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date the extension survey was completed.

The maximum interval between two surveys carried out according to method 1 shall not exceed 15 years, except in the case when one extension for no more than three months is granted.

**Table 2 : Survey intervals for closed loop system fresh water lubricated shafts (closed systems)**

	Flanged propeller coupling	Keyless propeller coupling	Keyed propeller coupling (2)
Every five years (1)	method 1 (3) or method 2 or method 3	method 1 (3) or method 2 or method 3	method 1 (3) or method 2
Extension 2,5 Y	yes (4)	yes (4)	yes (4)
Extension 1 Y	yes (5)	yes (5)	yes (5)
Extension 3 M	yes (6)	yes (6)	yes (6)

**Note 1:** For surveys (method 1, or method 2, or method 3) completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

The extension survey should normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date the extension survey was completed.

- (1) Unless an extension type (extension 2,5 Y, or extension 1 Y, or extension 3 M) is applied in between.
- (2) Method 3 is not allowed.
- (3) The maximum interval between two surveys carried out according to method 1 shall not exceed 15 years.
- (4) No more than one “2,5 year extension” can be granted. No further extension, of other type, can be granted.
- (5) No more than two consecutive “one year extension” can be granted. In the event an additional extension is requested, the requirements of the “2,5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2,5 years.
- (6) No more than one “three month extension” can be granted. In the event an additional extension is requested, the requirements of the “one year extension” or “2,5 year extension” are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year or 2,5 years.

### **3.3 Water lubricated shafts (open systems)**

#### **3.3.1 Shaft survey - Method 4**

The survey is to consist in:

- Drawing the shaft and examining the entire shaft (including liners, corrosion protection system and stress reducing features, where provided), inboard seal system and bearings
- For keyed and keyless connections:
  - removing the propeller to expose the forward end of the taper
  - performing a non-destructive examination (NDE) by an approved surface crack detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted). For shaft provided with liners, the NDE shall be extended to the after edge of the liner
- For flanged connection:

Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs, or when deemed necessary by the Surveyor, the coupling bolts and the flange radius are to be examined by means of an approved surface crack detection method
- Checking and recording the bearing clearances
- Verifying that the propeller is free of damages which may cause the propeller to be out of balance
- Verifying the satisfactory conditions of inboard seal during reinstallation of the shaft and the propeller.

#### **3.3.2 Shaft extension surveys - Extension types**

a) Extension up to 1 year

The survey is to consist of:

- Visual inspection of all the accessible parts of the shafting system
- Verification that the propeller is free of damages which may cause the propeller to be out of balance
- Checking and recording of the clearances of bearing
- Verification of the effectiveness of the inboard seal.

Prerequisites, to satisfactorily verify in order to apply extension up to 1 year, are the following ones:

- Review of the previous clearance recordings
- Service records
- Verification of no reported repairs by grinding or welding of shaft and/or propeller
- Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

b) Extension up to 3 months

The survey is to consist of:

- Visual inspection of all the accessible parts of the shafting system
- Verification that the propeller is free of damages which may cause the propeller to be out of balance
- Verification of the effectiveness of the inboard seal.

Prerequisites, to satisfactorily verify in order to apply extension up to 3 months, are the following ones:

- Review of the previous clearance recordings
- Service records
- Verification of no reported repairs by grinding or welding of shaft and/or propeller
- Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

#### **3.3.3 Shaft survey intervals**

a) Survey intervals (see Tab 3)

The following survey intervals according to method 4 are applicable to all types of propeller connections:

- for keyless propeller connections, the maximum interval between two consecutive dismantling and verifications of the shaft cone by means of non-destructive examination (NDE) shall not exceed 15 years
- for surveys completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

1) Configurations allowing 5 year intervals

- single shaft operating exclusively in fresh water
- single shaft provided with adequate means of corrosion protection, single corrosion resistant shaft
- all kinds of multiple shafts arrangements.

2) Other systems

Shaft not belonging to one of the configurations listed in item 1) has to be surveyed according to method 4 every 3 years.

b) Survey extensions (see Tab 3)

For all types of propeller connections, the interval between two consecutive surveys may be extended after execution of the extension survey, as follows:

- Extension up to a maximum of 1 year  
No more than one “one year extension” can be granted. No further extension, of other type, can be granted.
- Extension up to a maximum of 3 months  
No more than one “three month extension” can be granted. In the event an additional extension is requested, the requirements of the “one year extension” are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year.

The extension survey should normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date.

If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date the extension survey was completed.

**Table 3 : Survey intervals for water lubricated shafts (open systems)**

	All kinds of propeller coupling (4)	
<ul style="list-style-type: none"> <li>• Single shaft operating exclusively in fresh water</li> <li>• Single shaft provided with adequate means of corrosion protection, single corrosion resistant shaft</li> <li>• All kinds of multiple shaft arrangements</li> </ul>	Every five years (1)	Method 4
	Extension 1 Y	yes (2)
	Extension 3 M	yes (3)

	All kinds of propeller coupling (4)	
Other shaft configuration	Every three years (1)	Method 4
	Extension 1 Y	yes (2)
	Extension 3 M	yes (3)

**Note 1:** For surveys (method 4) completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

The extension survey should normally be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date the extension survey was completed.

- (1) Unless an extension type (extension 1 Y, or extension 3 M) is applied in between.
- (2) No more than one “one year extension” can be granted. No further extension, of other type, can be granted.
- (3) No more than one “three month extension” can be granted. In the event an additional extension is requested, the requirements of the “one year extension” are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year.
- (4) For keyless propeller connections, the maximum interval between two consecutive dismantling and verifications of the shaft cone by means of non-destructive examination (NDE) shall not exceed 15 years.

## Section 6 Boiler Survey

### 1 Steam boilers

#### 1.1

**1.1.1** Steam boilers, superheaters and economisers are to be examined internally on water-steam side and fire side and externally with the periodicity given in Ch 2, Sec 2, [5.6]. To this end, boilers are to be emptied and suitably prepared for the examination, and the water-steam side and fire side are to be cleaned and cleared of soot. Where necessary, the external surfaces are to be made accessible for inspection by removal of insulation and lining.

**1.1.2** Subject to the results of this visual examination, the Surveyor may require:

- non-destructive tests for detection of possible defects in critical areas of plating and shells, pipes and stays
- thickness measurements of plating and shells, furnaces, pipes and stays.

If appropriate, a new working pressure may be fixed by the Society.

When situated inside boiler combustion chambers, steam pipes of cylindrical boilers are to be examined at their ends, and if deemed necessary by the Surveyor, a sample pipe is to be removed for examination.

**1.1.3** If the internal examination is not carried out for practicable reasons, the parts subject to pressure are to be submitted to a hydraulic test.

**1.1.4** Boiler supports and securing arrangements (fixed and sliding seating, chocks, rolling stays, if any, etc.) are to be examined.

Boiler accessories and mountings (such as valves and studs, water level indicators, safety valves) are to be examined at each survey and opened out as considered necessary by the Society.

Forced circulation pumps of fired steam generators are, wherever possible, to be opened up.

Fuel supply pipes between pumps and burners, fuel tank valves, pipes and deck control gear are to be examined.

**1.1.5** When direct visual internal inspection is not feasible due to limited size of the internal spaces, such as for small boilers and/or narrow spaces, this may be replaced by a hydrostatic pressure test or by alternative verifications as determined by the Society.

**1.1.6** Upon completion of the internal survey, the boiler is to be examined under steam and fuel oil burners and safety devices checked under working conditions.

The adjustment of the safety valves is to be verified during each boiler internal examination.

Boiler safety valve and its relieving gear are to be examined and tested to verify satisfactory operation.

However, for exhaust gas heated economisers, if steam cannot be raised at port, it is the Chief Engineer's responsibility to set the safety valves at sea and the results are to be recorded in the log book for review by the Society.

**1.1.7** Review of the following records since the last boiler survey is to be carried out as part of the survey:

- operation
- maintenance
- repair history
- feedwater chemistry.

**1.1.8** In addition to the above requirements, in exhaust gas heated economisers of the shell type, accessible welded joints are to be subjected to a visual examination for cracking. Non-destructive testing may be required for this purpose.

**1.1.9** For electrical steam generators, in addition to the above requirements on the water-steam side, the following items are to be verified:

- condition of the electrical insulation resistance of the heating elements
- verification of proper operation and functioning of indication, remote control, automatic alarm and safety devices
- verification of absence of signs of corrosion and leakage of water
- opening-up of forced circulation pumps, wherever possible.

## **2 Thermal oil heaters**

### **2.1**

**2.1.1** Thermal oil heaters are to be internally and externally examined. The heater tubes are to be visually examined, and the tightness of the installation (including flange connections, valves and pumps) is to be checked through a test at the working pressure.

**2.1.2** Thermal oil heater supports and securing arrangements are to be examined.

Heater accessories and mountings are to be externally and (as needed) internally examined.

Forced circulation pumps are, wherever possible, to be opened up.

Fuel supply pipes between pumps and burners, fuel tank valves, pipes and deck control gear are to be examined.

**2.1.3** The following safety devices and instrumentation are to be examined and tested:

- thermal fluid temperature safety device and control
- thermal fluid flow meter
- device for low thermal fluid level in the expansion tank
- other regulation and safety systems.

**2.1.4** Where repairs and/or renewal of components exposed to pressure are performed, a pressure test is to be carried out to 1,5 times the working pressure.

**2.1.5** Upon completion of the survey, the thermal oil heater is to be examined under working conditions, with particular attention to safety devices and controls of the plant.

# Section 7 Hull Survey for New Construction

## 1 General

### 1.1

**1.1.1** In this Section, the Shipbuilder is understood as acting directly or on behalf of the Party requesting classification.

**1.1.2** When a hull construction is surveyed by the Society the Shipbuilder is to provide all appropriate evidence required by the Society that the hull is built in compliance with the rules and regulations, taking account of the relevant approved drawings.

**1.1.3** For oil tankers and bulk carriers subject to SOLAS Chapter II-1, Part A-1, Regulation 3-10 (goal-based ship construction standards for bulk carriers and oil tankers), the requirements as referred to in Article [6] and sub-articles [3.2] and [5.2] are applicable. <https://marine-offshore.bureauveritas.com/rules-guidelines>

## 2 Documentation to be available for the Surveyor during construction

### 2.1

**2.1.1** During the construction, the Shipbuilder is to provide the Surveyors access to documentation required by the Society; this includes documentation retained by the Shipbuilder or other third parties.

**2.1.2** The list of documents approved or reviewed by the Society for the specific new construction are to be made available by the Shipbuilder in due time for the Society during the construction as follows:

- a) plans and supporting documents required in Ch 2, Sec 1, [2.3]
- b) examination and testing plans
- c) NDE plans
- d) welding consumable details
- e) welding procedures specifications & welding procedures qualification records
- f) welding plan or details
- g) welder's qualification records
- h) NDE operators qualification records
- i) hot spot map of the structure, when additional class notation **VeriSTAR-HULL CM** is assigned.

**2.1.3** As required, evidence of compliance with Ch 2, Sec 1, [2.1.5] is also to be made available by the Shipbuilder to the Surveyor whilst the construction process proceeds to prove that the material and equipment supplied to the ship has been built or manufactured under survey relevant to the classification rules and delegated statutory requirements.

## 3 Ship construction file

### 3.1 Ship Construction File (SCF) for all ships, except those specified in [1.1.3]

**3.1.1** The Shipbuilder is to deliver documents for the Ship Construction File. In the event that items have been provided by another Party such as the Shipowner and where separate arrangement have been made for document delivery which excludes the Shipbuilder, that Party has the responsibility.

The Ship Construction File shall be reviewed for content in accordance with the requirements of [3.1.3].

**3.1.2** The Ship Construction File is to be placed on board the ship by the Shipbuilder to facilitate operation, maintenance, survey and repair.

**3.1.3** The Ship Construction File is to include but not limited to:

- as-built structural drawings including scantling details, material details, and, as applicable, wastage allowances, location of butts and seams, cross section details and locations of all partial and full penetration welds, areas identified for close attention and rudders (Refer to Part A, Chapter 3 and Part A, Chapter 4)
- manuals required for classification and statutory requirements, e.g. loading and stability, bow doors and inner doors and side shell doors and stern doors – operations and maintenance manuals (Refer to Pt B, Ch 11, Sec 6, [8] and Pt B, Ch 11, Sec 7, [7])
- ship structure access manual, as applicable
- copies of certificates of forgings and castings welded into the hull (Refer to NR 216 Materials and Welding)
- details of equipment forming part of the watertight and weather tight integrity of the ship
- a Cable Transit Seal Systems Register, to be prepared by the shipbuilder for watertight cable transits. The Register can be in either a hard copy or digitized media. It is to include a marking / identification system, documentation referencing manufacturer manual(s) for each type of cable transit installed, the Type Approval certification for each type of transit system, applicable installation drawings, and a recording of each installed transit documenting the as built condition after final inspection in the shipyard. This is to include sections to record any inspection, modification, repair and maintenance
- tank testing plan including details of the test requirements (Refer to Pt B, Ch 13, Sec 6)
- corrosion protection specifications (Refer to Ch 4, Sec 2, Pt B, Ch 4, Sec 4 and Pt D, Ch 4, Sec 3)
- details for the in-water survey, if applicable, information for divers, clearances measurements instructions etc., tank and compartment boundaries
- docking plan and details of all penetrations normally examined at drydocking
- Coating Technical File, for ships subject to compliance with the IMO Performance Standard for Protective Coatings (PSPC) and for ships assigned with the additional service feature/additional class notation **CPS(WBT)**.

**3.2 Ship Construction File (SCF) for ships as specified in [1.1.3]**

**3.2.1** A Ship Construction File (SCF) with specific information on how the functional requirements of the goal-based ship construction standards for bulk carriers and oil tankers have been applied in the ship design and construction is to be provided upon delivery of a new ship, and kept on board the ship and/or ashore and updated as appropriate throughout the ship's service. The content of the Ship Construction File is to conform to the requirements as specified in [3.2.2].

**3.2.2** The following design specific information is to be included in the Ship Construction File (SCF):

- areas requiring special attention throughout the ship's life (including the critical structural areas)
- all design parameters limiting the operation of a ship
- any alternatives to the rules, including structural details and equivalency calculations
- "as-built" drawings and information which are verified to incorporate all alterations approved by the recognized organization or flag State during the construction process including scantling details, material details, location of butts and seams, cross-section details and locations of all partial and full penetration welds
- net (renewal) scantlings for all the structural constituent parts, as-built scantlings and voluntary addition thicknesses (refer to Part A, Chapter 3 and Part A, Chapter 4)
- minimum hull girder section modulus along the length of the ship which has to be maintained throughout the ship's life, including cross-section details such as the value of the area of the deck and bottom zones, the renewal value for the neutral axis zone (refer to Part A, Chapter 3)
- a listing of the materials used for construction of the hull structure and provisions for documenting changes to any of the above during the ship's service life
- copies of the certificates of forgings and castings welded into the hull (refer to NR216 Materials and Welding)
- details of the equipment forming part of the watertight and weathertight integrity of the ship
- a Cable Transit Seal Systems Register, to be prepared by the shipbuilder for watertight cable transits. The Register can be in either a hard copy or digitized media. It is to include a marking / identification system, documentation referencing manufacturer manual(s) for each type of cable transit installed, the Type Approval certification for each type of transit system, applicable installation drawings, and a recording of each installed transit documenting the as built condition after final inspection in the shipyard. This is to include sections to record any inspection, modification, repair and maintenance.
- tank testing plan, including details of the test requirements (refer to Pt B, Ch 13, Sec 6)
- details for the in-water survey, when applicable, information for the divers, clearance measurement instructions etc., tank and compartment boundaries
- docking plan and details of all penetrations normally examined at drydocking
- Coating Technical File, for ships subject to compliance with the IMO Performance Standard for Protective Coatings (PSPC), see Note 1.

Note 1: PSPC means Performance Standard for Protective Coatings:

- for dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers, adopted by IMO Res. MSC.215(82), as amended, and
- for cargo oil tanks of crude oil tankers, adopted by IMO Res. MSC.288(87), as amended.

**3.2.3** Refer to Tab 1 for details of information to be further included. This information is to be kept on board the ship and/or ashore and updated as appropriate, throughout the ship’s life, in order to facilitate safe operation, maintenance, survey, repair and emergency measures.

**3.2.4** It is to be noted that parts of the SCF content may be subject to various degrees of restricted access and that such documentation may be appropriately kept ashore.

**3.2.5** The SCF is to include the list of the documents constituting the SCF and all information, listed in Tab 1, which is required for a ship’s safe operation, maintenance, survey, repair and in emergency situations. Details of specific information that is not considered to be critical to safety might be included, directly or by reference, to the other documents.

**3.2.6** When developing a SCF, all the columns in Tab 1 are to be reviewed to ensure that all necessary information has been provided.

**3.2.7** It may be possible to provide information listed in this sub-article under more than one Tier II item (see Note 1) as a single item within the SCF; for example, the Coating Technical File required by the PSPC (see Note 1 of [3.2.2]) is relevant for both “Coating life” and “Survey during construction”.

Note 1: Tier II items means the functional requirements included in the International Goal-based Ship Construction Standards for Bulk Carriers and Oil Tankers (GBS), adopted by IMO Res. MSC.287(87).

**3.2.8** The SCF is to remain with the ship and, in addition, be available to the Society and flag State throughout the ship’s life. Where information not considered necessary to be on board is stored ashore, procedures to access this information are to be specified in the onboard SCF. The intellectual property provisions within the SCF are to be duly complied with.

**3.2.9** The SCF should be updated throughout the ship’s life at any major event, including, but not limited to, substantial repair and conversion, or any modification to the ship structure.

**3.2.10** The SCF shall be reviewed, at the time of new building, in accordance with the requirements of [3.2.2] and [3.2.3] and the normal storage location shall be distinguished.

Note 1: Note 1: “Reviewed” means the examination of the SCF that is carried out by the Surveyor, at the end of the newbuilding process, in order to confirm that:

- drawings and documents required under [3.2]
- the possible additional drawings/documents provided by the shipyard, as per the Ship Construction File (SCF) list of drawings/documents are present in the copies of the SCF stored on board and in the ashore archive.

The “review” is not to be intended as an assessment of the drawings/documents in order to verify their compliances with the applicable Rules/Regulations.

**3.2.11** For the SCF stored on board ship, the Surveyor is to verify that the information is placed on board the ship, upon completion of ship construction.

**3.2.12** For the SCF stored on shore archive, the Surveyor is to verify that the information is stored on shore archive by examining the list of information included on shore archive, upon completion of ship construction.

**Table 1 : List of Information to be Included in the Ship Construction File (SCF)**

Tier II items	Information to be included	Further explanation of the content	Example documents	Normal storage location*
<p>* Normal storage location means a standard location where each SCF information item should be stored. However, those items listed as being on board should be on board as a minimum to ensure that they are transferred with the ship on a change of owner. on board = on board ship; on shore = on shore archive. Shore archive is to be operated in accordance with applicable international standards.</p> <p>(1) SCF-specific means documents to be developed especially to meet the requirements of these GBS guidelines (MSC.1/Circ.1343).</p> <p>(2) Key construction plans means plans such as midship section, main O.T. and W.T. transverse bulkheads, construction profiles/plans, shell expansions, forward and aft sections in cargo tank (or hold) region, engine-room construction, forward construction and stern construction drawings.</p> <p>(3) Yard plans means a full set of structural drawings, which include scantling information of all structural members.</p> <p>(4) Hull form means a graphical or numerical representation of the geometry of the hull. Examples would include the graphical description provided by a lines plan and the numerical description provided by the hull form data stored within an onboard computer.</p> <p>(5) Lines plan means a special drawing which is dedicated to show the entire hull form of a ship.</p> <p>(6) Equivalent (to Lines plan) means a set of information of hull form to be indicated in key construction plans for SCF purposes. Sufficient information should be included in the drawings to provide the geometric definition to facilitate the repair of any part of the hull structure.</p> <p>(7) PSPC means Performance Standard for Protective Coatings for dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers, adopted by IMO Resolution MSC.215(82), as amended and Performance Standard for Protective Coatings for cargo oil tanks of crude oil tankers, adopted by IMO Resolution MSC.288(87), as amended.</p>				

## 4 Newbuilding survey planning

### 4.1

**4.1.1** Prior to commencement of surveys for any newbuilding project, the Shipbuilder is to discuss with the Society at a kick-off meeting the items of specific activities which are relevant to the shipbuilding functions listed in the kick-off meeting templates given in NR540 “Kick-off Meeting Templates for Newbuilding”. The purpose of the meeting is to review and agree how the listed items are to be addressed. The meeting is to take into account the Shipbuilder construction facilities and ship type including the list of proposed subcontractors. This list is not exhaustive and can be modified to reflect the construction facilities or specific ship type. A record of the meeting is normally to be prepared and updated by the Shipbuilder, based upon the content of the kick-off meeting templates. The Shipbuilder should agree to undertake ad hoc investigations during construction as may be requested by the Society where areas of concern arise and to keep the Society advised of the progress of any investigation. Whenever an investigation is undertaken, the Shipbuilder is, in principle, to agree to suspend relevant construction activities if warranted by the severity of the problem. The records are to take note of specific published Administration requirements and interpretations of statutory requirements.

**4.1.2** The shipyard shall be requested to advise of any changes to the activities agreed at the kick off meeting and these are to be documented in the survey plan. E.g. if the Shipbuilder chooses to use or change sub-contractors, or to incorporate any modification necessitated by changes in production or inspection methods, rules and regulations, structural modifications, or in the event where increased inspection requirements are deemed necessary as a result of a substantial non-conformance or otherwise.

**4.1.3** Shipbuilding quality standards for hull structure during new construction are to be reviewed and agreed during the kick-off meeting. Structural fabrication is to be carried out in accordance with IACS Recommendation 47, “Shipbuilding and Repair Quality Standard”, or a Recognized Fabrication Standard (RFS) which has been accepted by the Society prior to the commencement of fabrication/construction (Refer to Pt B, Ch 13, Sec 2, [1.1.4]). The work is to be carried out in accordance with these Rules and under survey of the Society.

The Society may accept an RFS as an alternative to IACS Recommendation 47 provided that [4.1.4] or [4.1.5] is complied with as applicable.

**4.1.4** Where a RFS is well established and has well documented history (3 or more years prior to the new vessel contract) of successful application to similar designs as the new vessel and that history is for the same Shipyard as the new vessel. Then the Shipyard is to create a summary document referencing the RFS to be used in construction and highlighting any limitations to usage of the selected RFS. This summary document is to be included with the “record of kick-off meeting” for the vessel.

The summary document is also to be included in the SCF, (for Tankers and Bulk Carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10 per App 2, Table A Tier II Item 11), as applicable.

**4.1.5** Where a RFS is new or revised or otherwise not as per [4.1.4], the following steps are to be carried out:

- a) the tolerances and fabrications standards of the RFS are to be compared with those of Recommendation 47. Any that are less stringent than those of Recommendation 47 are to be identified.
- b) the tolerances and fabrication standards of the RFS identified in [4.1.5](a) are to be assessed to determine the acceptability for use and/or any restrictions for usage for the subject (or proposed) design. Details of how the acceptability for use and/or restrictions are to be recorded, and,
- c) a summary document including the outcomes of [4.1.5](a) and [4.1.5](b) is to be compiled. This document is to also include a reference to the RFS, details of the tolerance and fabrication standards not analysed as part of [4.1.5](b) and any limitations to the usage of the RFS.

The summary document is to be included with the “record of the kick-off meeting” of the vessel. The summary document is also to be included in the SCF, (for Tankers and Bulk Carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10 per App 2, Table A Tier II Item 11), as applicable.

**4.1.6** The kick-off meeting may be attended by other Parties (Owner, Administrations...) subject to agreement by the shipbuilder.

**4.1.7** In the event of series ship production, the requirement for a kick off meeting may be waived for the second and subsequent ships provided that no changes to the specific activities agreed in the kick off meeting for the first ship are introduced. If any changes are introduced, these are to be agreed in a new dedicated meeting and documented in a record of such meeting.

## **5 Examination and test plan for newbuilding activities**

### **5.1 Applicable to all ships**

**5.1.1** The Shipbuilder is to provide to the Surveyor plans of the items which are intended to be examined and tested. These plans need not be submitted for approval and examination at the time of the kick-off meeting. They are to include:

- proposal for the examination of completed steelwork generally referred to as the block plan and are to include details of joining blocks together at the pre-erection and erection stages or at other relevant stages
- proposal for fit up examinations where necessary
- proposal for testing of the structure (leak and hydrostatic) as well as for all watertight and weathertight closing appliances
- proposal for non-destructive examination
- any other proposal specific to the ship type or to the delegated statutory requirements.

**5.1.2** The plans and any modification to them are to be submitted to the Surveyors in sufficient time to allow review before the relevant survey activity commences.

### **5.2 Applicable for ships as specified in [1.1.3]**

**5.2.1** In addition to [5.1.1], the Shipbuilder is to provide plans of the items which are intended to be examined and tested in accordance with the Rules in a document known as the Survey Plan, taking into account the ship type and design. This Survey Plan is to be reviewed at the time of the kick-off meeting, and is to include:

- A set of requirements, specifying the extent and scope of the construction survey(s) and identifying areas that need special attention during the survey(s), to ensure compliance of construction with mandatory ship construction standards, including:
  - types of surveys (visual, non-destructive examination, etc.) depending on the location, materials, welding, casting, coatings, etc.
  - establishment of a construction survey schedule for all the assembly stages from the kick-off meeting, through all major construction phases, up to delivery
  - inspection/survey plan, including provisions for the critical areas identified during design approval
  - inspection criteria for acceptance
  - interaction with shipyard, including notification and documentation of survey results
  - correction procedures to remedy the construction defects
  - list of the items that would require scheduling or formal surveys
  - determination and documentation of the areas that need special attention throughout ship’s life, including criteria used in making the determination
- A description of the requirements for all types of testing during survey, including test criteria.

## **6 Design transparency**

### **6.1 Applicable for ships as specified in [1.1.3]**

**6.1.1** For ships subject to compliance with IMO Res. MSC.287(87), IMO Res. MSC.290(87), IMO Res. MSC.454(100) and IMO MSC.1/Circ.1343, readily available documentation is to include the main goal-based parameters and all relevant design parameters that may limit the operation of the ship.

**6.1.2** The Shipyard or the Designer is to authorize the Society to make available relevant technical correspondence in relation with the SCF to Owners and Flag states.

## Section 8 Survey of Watertight Cable Transits

### 1 General

#### 1.1 Application

**1.1.1** The requirements of this Section apply to all vessels contracted for construction on or after 1st July 2021 and are in addition to the requirements of Ch 2, Sec 2; Ch 3, Sec 1; Ch 3, Sec 2; Ch 3, Sec 3 and Ch 3, Sec 7.

**1.1.2** Watertight cable transits are to be installed and maintained in accordance with the manufacturer's requirements and in accordance with the requirements of the relevant Type Approval certification.

### 2 Cable Transit Seal Systems Register

#### 2.1 New construction

**2.1.1** A Cable Transit Seal Systems Register is to be provided by the shipbuilder for all watertight cable transits fitted to the vessel. The Cable Transit Seal Systems Register can be in either a hard copy or digitized media. It is to include a marking / identification system, documentation referencing manufacturer manual(s) for each type of cable transit installed, the Type Approval certification for each type of transit system, applicable installation drawings, and a recording of each installed transit documenting the as built condition after final inspection in the shipyard. It is to include sections to record any inspection, modification, repair and maintenance.

**2.1.2** The Cable Transit Seal Systems Register is to be reviewed by the attending Surveyor to confirm it contains a list of the watertight cable transits, applicable cable transit information and sections to maintain in-service maintenance and survey records.

**2.1.3** For manned vessels, the Cable Transit Seal Systems Register is to be held onboard of the vessel. For unmanned vessels, if a suitable storage location does not exist onboard, the Register may be held ashore. The Cable Transit Seal Systems Register is to be readily available for the attending surveyor.

#### 2.2 Vessel in service

**2.2.1** The owner is to maintain the Cable Transit Seal Systems Register to record any disruption (repair, modification or opening out and closing) to a cable transit or to record the installation of a new cable transit.

### 3 Installation and maintenance of Watertight Cable transits

#### 3.1

**3.1.1** At new construction and periodic surveys it is to be confirmed that:

- cable transits have been installed, and where disrupted have been reinstated, in accordance with the manufacturer's requirements and in accordance with the requirements of Type Approval
- where specified, appropriate specialized tools have been used.

# Appendix 1 Class Requirements and Surveys of Laid-up Ships

## 1 General

### 1.1

**1.1.1** In order to maintain its class during a normal operation period, a ship is to be submitted to the surveys described in Ch 2, Sec 2 at their due dates and to the satisfaction of the Society, and is to be free of overdue surveys and conditions of class during the considered period.

**1.1.2** When a ship stops trading and is put out of commission for a certain period, i.e. is laid-up, the normal survey requirements may no longer apply provided that the Owner notifies the Society of this fact. The Owner is also to submit a lay-up maintenance program to the Society for approval.

**1.1.3** The lay-up maintenance program includes:

- the safety conditions to be kept throughout the lay-up period
- the measures taken to preserve the maintenance of the ship throughout the lay-up period
- the survey requirements to be complied with for lay-up, maintenance of class in lay-up and re-commissioning.

## 2 Safety conditions

### 2.1

#### 2.1.1 Power supply

Adequate power supply is to be supplied, or readily available, all around the clock, either from independent means on board the ship or from shore.

The following safety conditions are to be kept throughout the lay-up period.

#### 2.1.2 Manning

Watch personnel are to be provided. The number of the watch personnel will depend on the size of the ship, the lay-up site and mooring arrangements, the shore assistance available in case of fire, leakage or flooding, the maintenance required to provide adequate preservation. A permanent shore communication installation (radio, telephone) is also to be available.

#### 2.1.3 Fire protection and fire fighting

The following is to be complied with:

- automatic fire alarm systems, where provided, are to be in working order and in operation
- fire-fighting installations are to be tested regularly and readily available
- the fire main is to be readily available and periodically tested under pressure
- ventilation trunks, air inlets and watertight doors are to be kept closed.

#### 2.1.4 Protection against explosion

Cargo spaces and piping systems are to be cleaned and ventilated to prevent gas from forming any pockets.

An inert gas system in operation is recommended for the cargo spaces of oil and chemical tankers.

All flammable materials, sludge, etc. are to be removed from the ship's bilge, tank tops, double bottom tanks, engine room, pump rooms and similar spaces.

Hot work is not to be carried out during lay-up, unless special precautionary measures are taken.

#### 2.1.5 Safety equipment

All the equipment usually recommended for the safety of the watch personnel is to be provided, kept in working order and tested regularly.

The usual life-saving equipment such as liferafts, life-buoys, breathing apparatus, oxygen masks and distress signals is to be provided and made accessible.

The requirements of the flag Administration and of the local port authorities of the lay-up site are usually to be applied.

#### 2.1.6 Emergency power

The emergency source of power, emergency generator and/or emergency air compressor are to be kept in working order and tested weekly.

### 3 Preservation measures for lay-up and maintenance

#### 3.1 General

**3.1.1** A lay-up log-book is to be kept on board, in which the maintenance work and tests carried out during the lay-up period are to be entered with the corresponding dates. The nature and frequency of the maintenance, inspections and tests are also to be defined in the lay-up log book.

**3.1.2** The following measures for preservation and maintenance during the lay-up period are to be taken by Owners according to the type of ship, hull equipment, machinery installations and the specific cases of lay-up conditions.

#### 3.2 Exposed parts of the hull

**3.2.1** Underwater parts of the hull are to be protected against corrosion. It is advisable to provide an impressed current cathodic protection system where the quantity of corrosive waste discharge is particularly high. When such systems are provided they are to be serviced and checked at regular intervals. The condition of sacrificial anodes is to be evaluated at the annual lay-up condition surveys.

**3.2.2** The coating of the hull above the waterline, exposed decks, access doors or covers on exposed decks, and hatch covers is to be maintained in satisfactory condition.

All accesses leading to internal spaces are to be kept closed.

All vent pipes and ventilation trunks are to be kept closed.

#### 3.3 Internal spaces

**3.3.1** Cargo tanks and cargo holds are to be emptied, cleaned and kept dry.

Ballast tanks are to be kept either full or empty. When ballast spaces are kept filled with sea water, special care is to be taken to keep such spaces topped up and protected against corrosion. When provided, sacrificial anodes are to be renewed when deemed necessary. The topping up is to be regularly verified.

**3.3.2** Chain lockers are to be drained, cleaned and kept dry. Coating with bituminous paint is recommended.

**3.3.3** Fuel oil and lubricating oil tanks are to be drained regularly.

Lubricating oil analysis is to be performed regularly and the oil renewed when the result is not satisfactory. Prior to being refilled, tanks are to be cleaned.

Empty lubricating oil tanks are to be cleaned and kept dry.

Fresh water or distilled water tanks are to be kept full or empty. Empty tanks are to be cleaned and kept dry. Where cement wash is used as a protective sheathing, this is to be examined and repaired prior to filling.

**3.3.4** The bilge and tank top in engine rooms are to be cleaned and kept dry.

Hull sea inlet and outlet valves not in use are to be kept closed.

#### 3.4 Deck fittings

**3.4.1** The windlass, capstans and winches are to be regularly greased and turned once a week.

All wire cables are to be kept greased.

Visible parts of chains are to be coal-tarred and examined regularly.

Chocks and hawse pipes are to be coated with bituminous paint or equivalent if deemed necessary.

Cargo piping on deck is to be drained, blown through if deemed necessary and kept dry by opening up drains.

Electrical machinery and navigational equipment are to be protected by watertight covers.

#### 3.5 Machinery

##### 3.5.1 Machinery spaces

The air temperature inside the machinery spaces is normally to be kept above 0°C.

Humidity is to be kept as low as possible and within acceptable limits.

##### 3.5.2 Machinery - General

Exposed mechanical parts of machinery are to be greased.

All rotating machinery such as diesel engines, reciprocating engines, pumps, turbines, electric motors and generators are to be turned at regular intervals with a limited number of revolutions (the lubricating oil system should be put in operation or proper priming applied). Units are not to be stopped in the same position as the previous one.

Bearing boxes are to be emptied, cleaned and refilled with new oil.

### 3.5.3 Main turbines

Turbines are to be kept dry.

All steam inlets are to be sealed.

Expansion arrangements (sliding feet) are to be suitably greased.

Electric heaters are to be put inside the turbines. Heat drying is to be made in open circuit, all valves shut and gland closing devices withdrawn.

Turbines are to be turned weekly, the lubricating oil system being put in service. The shaft line is to be stopped after turning an integer number of revolutions plus one quarter of a revolution.

### 3.5.4 Reduction gears

For large reduction gears, a fan activating the circulation of hot air in closed circuit with air hoses is to be fitted (intake at lower part of casing and discharge at upper part).

### 3.5.5 Auxiliary turbine-driven machinery

Stators are to be drained and kept dry.

Shaft sealing glands are to be lubricated.

Lubricating oil is to be analysed and renewed when deemed necessary. Prior to oil renewal, the oil casings are to be cleaned.

Exhaust steam pipes are to be kept dry.

Stuffing boxes are to be dismantled.

Turbines are to be turned weekly an integer number of revolutions plus one quarter of a revolution.

### 3.5.6 Condensers and heat exchangers

Condensers and heat exchangers are to be drained and kept dry.

Desiccant is to be placed in steam spaces.

Water sides are to be washed with fresh water.

The condition of the zinc anodes is to be periodically checked.

When tubes are fitted with plastic or fibre packing, water sides are to be filled with alkaline distilled water.

When tubes are expanded or fitted with metal packing, water sides are to be provided with desiccants and kept dry.

### 3.5.7 Auxiliary machinery

Air receivers are to be drained, opened up and cleaned. Pressure relief valves are to be cleaned and slightly lubricated.

Air compressor crankcases are to be drained, cleaned and refilled with clean oil. Cylinders and valves are to be lubricated. Coolers are to be drained and dried. Air drains are to be opened and the system dried.

Air start lines are to be drained and dried.

Hot-wells/return tanks are to be drained and dried.

De-aerators are to be drained and dried.

Feed pumps and extraction pumps are to be drained and dried.

Air ejectors are to be drained and dried.

Main circulation pumps are to be drained and dried.

Evaporators are to be drained, cleaned and dried.

### 3.5.8 Piping

Pipes not in use are to be drained and kept dry.

### 3.5.9 Diesel engines

Daily tank fuel oil outlet pipes and all injection equipment are to be filled with filtered gas oil.

Fresh water circuits are to be filled with water mixed with rust inhibitors. Fresh water pH is to be checked monthly.

Oil of hydraulic regulators is to be replaced.

Sea water cooling pipes are to be drained.

Crankcases are to be provided with desiccant.

Starting valves are to be lubricated (internally and externally).

Motor oil is to be sprayed in cylinders and on all external parts liable to corrosion.

Cams and cylinders are to be motor oil sprayed monthly.

Turbo-compressor/charger ball bearings are to be oil sprayed and rotated for an integer number of revolutions plus one quarter of a revolution.

Engine air inlets and exhaust gas pipes are to be sealed.

Scavenge spaces are to be cleaned

Engines are to be turned weekly.

### 3.5.10 Shaft lines

Shaft lines are to be coated with grease.

Shaft bearing cooling pipes are to be drained.

For sea water lubricated propeller shafts, the packing gland of the engine room stuffing box is to be tightened.

For oil lubricated stern tubes, lubricating oil is to be analysed and renewed if not satisfactory. The oil level in the tank is to be verified regularly.

Propeller shaft lines are to be rotated an integer number of revolutions plus one quarter of a revolution.

## 3.6 Electrical installations

**3.6.1** Main and secondary switchboards, sub-feeder panels, fuse panels and starters are to be made tight. Desiccant is to be provided.

Contacts of relays, breakers and switch-breakers are to be coated with neutral vaseline.

Bearings of generators are to be cleaned of old grease and protected with new oil or grease.

Carbon brushes are to be lifted off their commutations.

**3.6.2** Electrical insulation of each item is to be kept at a minimum 200,000 Ohms and general insulation is to be not less than 50,000 Ohms. Local electric heating may be necessary to improve the level of insulation, particularly in the generators/alternators and large motors.

A insulation resistance test is to be performed regularly.

## 3.7 Steering gear

**3.7.1** Exposed mechanical parts are to be greased or oil sprayed.

For electrical parts the same preservation measures given in [3.6] are to be taken.

It is recommended that the steering gear should be operated monthly.

## 3.8 Boilers

**3.8.1** Smoke sides of boilers are to be swept, washed clean with basic hot water and hot air dried.

**3.8.2** Water and steam sides should preferably be preserved using the dry method, keeping the moisture at the lowest possible level, the ideal level being between 30% and 35%. It is advisable to ensure that no residual water remains to cause rapid corrosion. Drum doors are to be kept closed.

In other cases, it is advisable to keep the boilers, superheaters and economisers filled with water having a pH around 10,5. Hydrazine hydrate treatment of the water is preferable to reduce risks of corrosion caused by dissolved oxygen. The water is to be regularly analysed.

**3.8.3** Air heaters are to be cleaned and kept dry.

Uptake, shell and fan outlets are to be cleaned and kept closed with watertight hoods.

Burners are to be dismantled, and atomisers greased.

Desiccant is to be provided in furnaces where deemed necessary.

Expansion arrangements (sliding feet) are to be suitably greased.

The internal condition of boilers is to be checked every three months.

**3.8.4** Boilers may also be preserved sealed with inert gas (nitrogen), provided that cocks and valves are tight and the installation allows an internal pressure of at least 0,05 bar to be maintained to prevent air penetration. Regular checks of the overpressure are to be carried out and results recorded in the log-book.

## 3.9 Automated installation

**3.9.1** Recommendations for electronic components are the same as those given for electrical installations.

For pneumatic parts the manufacturers' recommendations are to be followed and the system is to be checked regularly.

Pressure, temperature or level sensors are generally not affected by damage when not used. However, when available, the manufacturers' recommendations are to be followed.

## **4 Lay-up site and mooring arrangements**

### **4.1 General**

**4.1.1** The choice and suitability of the lay-up site, as well as the type of mooring conditions, the mooring arrangements and their efficiency during the lay-up period remain the responsibility of the Owner.

However, at the Owner's request, the mooring arrangement may be reviewed by the Society.

### **4.2 Recommendations for the lay-up site**

**4.2.1** The following recommendations are to be considered by Owners regarding the choice and suitability of the lay-up site.

The site should be:

- sheltered from open sea, strong currents and waves
- not exposed to whirling winds or turbulent tidal waves
- not exposed to moving ice
- clear of corrosive waste waters
- provided with adequate ship/shore communications.

### **4.3 Recommendations for the mooring arrangements**

**4.3.1** The following recommendations are to be considered by Owners with respect to the mooring arrangements:

- ground holding should be adequate
- vessels laid-up to buoys or anchored should be moored in such a way as to be prevented from swinging with normal wind and tidal changes
- chain cables should not be subject to cross-contact or twisting and stern anchorage should generally be provided
- laid-up ships should be in ballast condition in order to reduce the effects of wind. Due consideration should be given to the still water bending moment. For guidance, normal ballast draft should be roughly between 30% and 50% of the maximum draft.

**4.3.2** Ships should normally be moored singly. However, when several ships are moored together, the following provisions are to be made:

- ships are to be moored bow to stern
- ships are to be of approximately the same size
- the number of ships moored together is, in principle, not to exceed six
- breast-lines are to be of similar elasticity
- fenders are to be provided.

### **4.4 Review of the mooring arrangements**

**4.4.1** As indicated in [4.1.1], at the Owners' request, the mooring arrangements may be reviewed by the Society.

**4.4.2** The proposal for the mooring arrangements is in such case to be submitted by the Owner and is to include the following information.

a) Mooring site:

- geographical area (to be specified on a map)
- characteristics of the sea bottom
- water depth
- preferential angular sectors (effects of wind / tide / current) indicated according to statistical studies
- wave characteristics (amplitude, periods)

b) Geometry of mooring arrangements:

- ship's position and direction
- shore anchorage
- diagram showing mooring equipment (fore and aft)
- angle between chain cables and ship's centreline

- c) Characteristics of mooring equipment:
- maximum holding strength of each anchor
  - type of mooring lines (chains, cables, sinkers, etc.)
  - length of each section
  - weight of each section
  - mechanical characteristics of each section (breaking load)
  - weight of sinkers.

**4.4.3** On completion of the installation, the mooring arrangements are to be surveyed by the Society. When the ship is anchored, the underwater installation is to be inspected by a diver whose report is to be presented to the Society.

**4.4.4** It is the responsibility of the Owners to ascertain the efficiency of the mooring arrangements during the lay-up period. The mooring arrangements are to be re-examined at regular intervals (at least each year when the ship is anchored) and when abnormal weather conditions occur at the lay-up site.

## **5 Surveys**

### **5.1 Laying-up survey**

**5.1.1** At the beginning of the lay-up period a laying-up survey is to be carried out whose scope is to verify that the safety conditions, preservation measures, lay-up site and mooring arrangements are in accordance with the program agreed by the Society.

**5.1.2** Upon satisfactory completion of this survey, a memorandum is issued to confirm that the ship has been placed in lay-up, which is subsequently to be kept on board.

### **5.2 Annual lay-up condition survey**

**5.2.1** As described in Ch 2, Sec 2, [8], an annual lay-up condition survey is to be performed in lieu of the normal annual class surveys. The purpose of this survey is to ascertain that the lay-up maintenance program implemented is continuously complied with.

**5.2.2** It is to be checked that the arrangements made for the lay-up are unchanged and that the maintenance work and tests are carried out in accordance with the maintenance manual and recorded in the lay-up log-book.

**5.2.3** Upon satisfactory completion of the survey, the Certificate of Classification is endorsed.

### **5.3 Re-commissioning survey**

**5.3.1** Owners are to make the necessary arrangements to remove the temporary lay-up installations provided for preservation measures and the protective materials and coatings (oil, grease, inhibitors, desiccants), before the survey is commenced. It is the Owners' responsibility to verify that the ship parts that are not covered by class are reactivated in satisfactory operational condition.

**5.3.2** The scope of the re-commissioning survey is to include:

- a general examination of the hull, deck fittings, safety systems, machinery installations (including boilers whose survey is not due) and steering gear
- all periodical surveys due at the date of re-commissioning or which became overdue during the lay-up period
- dealing with the conditions of class due at the date of re-commissioning or which became due during the lay-up period.

**5.3.3** For the hull the following is to be carried out:

- examination of shell plating above the waterline, deck plating, hatch covers and coamings
- examination of load line items
- overall survey of all cargo tanks/holds
- overall survey of representative ballast tanks when the lay-up period does not exceed two years
- overall survey of all ballast tanks when the lay-up period is two years and over
- function tests of bilge and ballast systems.

**5.3.4** For the deck fittings the following is to be carried out:

- examination of the fire main under working pressure
- where possible, examination of deck piping under working pressure
- function tests of class items
- checking inert gas installation under working condition after inspection of water seal and function test of deck non-return valve and pressure/vacuum valves.

**5.3.5** For machinery installations the following is to be checked:

- the analysis of lubricating oil of main engines, auxiliary engines, reduction gears, main thrust bearings and sterntube
- the general condition of crankcase, crankshaft, piston rods and connecting rods of diesel engines
- the crankshaft deflections of diesel engines. In addition when engines have been laid-up for more than two years, one piston is to be disconnected and one liner is to be removed for examination. Dismantling is to be extended if deemed necessary
- the condition of blades of turbines through the inspection doors
- the condition of the water side of condensers and heat exchangers
- the condition of expansion arrangements
- the condition of reduction gears through the inspection doors
- the condition after overhauling of pressure relief devices
- the test of bilge level alarms, when fitted.

**5.3.6** The main and emergency electrical installations are to be tested. The parallel shedding of main generators and main switchboard safety devices are to be checked. An insulation resistance test of the electrical installation is to be performed.

**5.3.7** For the fire prevention, detection and fire-fighting systems, the following is to be examined and/or tested:

- remote control for quick closing of fuel oil valves, stopping of fuel oil pumps and ventilation systems, closing of fire doors and watertight doors
- fire detectors and alarms
- fire-fighting equipment.

**5.3.8** The automated installation is to be checked for proper operation.

**5.3.9** When classed, the installations for refrigerated cargo are to be examined under working conditions. Where the lay-up period exceeds two years, representative components of the installation are to be dismantled.

**5.3.10** For cargo installations on liquefied gas carriers, the following is to be carried out:

- inspection of the primary barrier in tanks
- for membrane tanks, a global gas test of tanks whose results are to be compared with those obtained at ship's delivery
- testing of gas piping at working pressure using inert gas.

A Surveyor of the Society is to attend the first cooling down and loading of the ship.

**5.3.11** For other specific classed installations, the Owners are to submit a survey program to the Society.

**5.3.12** On completion of the above surveys, sea trials are to be performed in the presence of a Surveyor of the Society.

The sea trials are to include:

- verification of the satisfactory performance of the deck installations, main propulsion system and essential auxiliaries, including a test of the safety devices
- an anchoring test
- complete tests of steering gear
- full head and full astern tests
- tests of automated machinery systems, where applicable.

**5.3.13** Upon satisfactory completion of the surveys, a memorandum is issued to confirm the carrying out of all relevant surveys and the recommissioning of the ship.

### CHAPTER 4

## SCOPE OF SURVEYS IN RESPECT OF THE DIFFERENT SERVICES OF SHIPS

---

Section 1	General
Section 2	Single Skin and Double Skin Bulk Carriers
Section 3	Oil Tankers and Combination Carriers
Section 4	Chemical Tankers
Section 5	Liquefied Gas Carriers
Section 6	Ro-Ro Cargo Ships and Pure Car and/or Truck Carriers, Passenger Ships and Ro-Ro Passenger Ships
Section 7	General Cargo Ships
Section 8	Other Service Notations
Section 9	Ships using Low Flashpoint Liquid or Gas Fuels
Section 10	Ships using Fuel Cells
Section 11	Ships using Onboard Carbon Capture and Storage Systems
Section 12	Ships using Wind Propulsion Systems
Appendix 1	Oil Tanker Longitudinal Strength Assessment

# Section 1 General

## 1 General

### 1.1

**1.1.1** The purpose of this Chapter is to give details on the scope of surveys of certain ships which, due to the service notation and/or the additional service feature assigned, and related equipment, need specific requirements to be verified for the maintenance of their class.

**1.1.2** These specific requirements either are additional to or supersede those stipulated in Part A, Chapter 3, which gives general requirements for surveys applicable to all types of ships: this is indicated in each Section of this Chapter. These surveys are to be carried out at intervals as described in Ch 2, Sec 2, concurrently with the surveys of the same type, i.e. annual, intermediate or class renewal surveys, detailed in Part A, Chapter 3.

**1.1.3** Owners are reminded that a general examination of the ship having the same scope of an annual survey is to be carried out at the completion of the class renewal survey, see Ch 3, Sec 3, [1.1.7]. Where specific requirements are given in this Chapter for the class renewal survey, they are additional to the applicable requirements for the annual survey.

## 2 Service notations and/or additional service features subject to additional surveys

### 2.1

**2.1.1** The specific requirements detailed in this Chapter are linked to the service notation(s) and/or the additional service feature(s) assigned to the ship at the request of the Owner. Where a ship has more than one service notation, the specific requirements linked to each one are applicable, insofar as they are not contradictory (in such case, the most stringent requirement will be applied).

**2.1.2** Tab 1 indicates which service notations and/or the additional service features are subject to specific requirements, and in which Section or Article they are specified.

**Table 1 : Service notations and/or additional service features for which specific requirements are applicable**

# Section 2 Single Skin and Double Skin Bulk Carriers

## 1 General

### 1.1 Application

**1.1.1** The requirements of this Section apply to all self-propelled ships which have been assigned one of the following service notations:

- **bulk carrier ESP** (whether of single or double skin construction)
- **bulk carrier BC-A ESP** (whether of single or double skin construction)
- **bulk carrier BC-B ESP** (whether of single or double skin construction)
- **bulk carrier BC-C ESP** (whether of single or double skin construction)
- **self-unloading bulk carrier ESP**
- **ore carrier ESP**
- **combination carrier/OBO ESP**
- **combination carrier/OOC ESP**

Note 1: A bulk carrier is a ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks in cargo spaces, and is intended primarily to carry dry cargo in bulk. Combination carriers are included. Ore carriers and combination carriers are not covered by the Common Structural Rules.

Note 2: A double skin bulk carrier is a ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks in cargo spaces, and is intended primarily to carry dry cargo in bulk, including such types as ore carriers and combination carriers, in which all cargo holds are bounded by a double-side skin (regardless of the width of the wing space). Ore carriers and combination carriers are not covered by the Common Structural Rules.

Note 3: For bulk carriers with hybrid cargo hold arrangements, e.g. with some cargo holds of single side skin and others of double side skin, the requirements of single side skin bulk carriers are to apply to cargo holds of single side skin and the requirements of double skin bulk carriers are to apply to cargo holds of double side skin and associated wing spaces.

Note 4: For combination carriers with longitudinal bulkheads, additional requirements are specified in Ch 4, Sec 3, as applicable.

**1.1.2** The requirements apply to the surveys of the hull structure and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces, fuel oil tanks within the cargo length area and all ballast tanks. They are additional to the requirements applicable to the remainder of the ship, given in Part A, Chapter 3 according to the relevant surveys.

**1.1.3** The requirements contain the minimum extent of examination, thickness measurements and tank testing. When substantial corrosion, as defined in Ch 2, Sec 2, [2.2.7], and/or structural defects are found, the survey is to be extended and is to include additional close-up surveys when necessary.

**1.1.4** In any kind of survey, i.e. class renewal, intermediate, annual or other surveys having the same scope, thickness measurements, when required by Tab 11, of structures in areas where close-up surveys are required are to be carried out simultaneously with close-up surveys.

**1.1.5** In all cases the extent of thickness measurements is to be sufficient as to represent the actual average condition.

**1.1.6** When, in any survey, thickness measurements are required:

- the procedure detailed in Ch 2, Sec 2, [2.3] is to be applied
- the thickness measurement firm is to be part of the survey planning meeting to be held prior to commencing the survey.

**1.1.7** Special consideration may be given to the extent of close-up surveys and/or thickness measurements in cargo holds as required below for class renewal, intermediate or annual surveys, when all internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of the cargo holds, excluding the flat tank top areas and the hopper tank sloped plating approximately 300 mm below the side shell frame end brackets, have protective coating in good condition.

The above special consideration may also be given to existing bulk carriers, where Owners elect to coat or recoat cargo holds, in accordance with the Manufacturers' recommendations. However, prior to re-coating the cargo holds, scantlings are to be assessed in the presence of a Surveyor of the Society.

Note 1: Special consideration (or specially considered) as used in this Section is intended to mean as a minimum, that sufficient close-up inspection and thickness measurements are taken to confirm the actual average condition of the structure under the coating.

**1.1.8** Ships which are required to comply with Ch 6, Sec 2, [1.3] are subject to the additional thickness measurements contained in Ch 6, Sec 2, [1.3.4] and Ch 6, Sec 2, [1.3.5] with respect to the vertically corrugated transverse watertight bulkhead between cargo holds Nos. 1 and 2 for purposes of determining compliance with Ch 6, Sec 2, [1.3] prior to the relevant compliance deadline stipulated in Ch 6, Sec 2, [1.2.1] and at subsequent intermediate surveys (for ships over 10 years of age) and class renewal surveys for purposes of verifying continuing compliance with Ch 6, Sec 2, [1.3].

**1.1.9** Ships which are required to comply with Ch 6, Sec 2, [5] are subject to the additional thickness measurements contained in Ch 6, Sec 2, [5.3] with respect to the side shell frames and brackets for the purposes of determining compliance with Ch 6, Sec 2, [5] prior to the relevant compliance deadline stipulated in Ch 6, Sec 2, [5.2] and at subsequent intermediate and class renewal surveys for purposes of verifying continuing compliance with Ch 6, Sec 2, [5].

## **1.2 Documentation on board**

**1.2.1** The Owner is to obtain, supply and maintain documentation on board as specified in [1.2.2] and [1.2.3], which is to be readily available for examination by the Surveyor.

The documentation is to be kept on board for the lifetime of the ship.

For bulk carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10, the Owner is to arrange the updating of the Ship Construction File (SCF) throughout the ship's life whenever a modification of the documentation included in the SCF has taken place. Documented procedures for updating the SCF are to be included within the Safety Management System.

**1.2.2** A survey report file is to be a part of the documentation on board consisting of:

- reports of structural surveys
- hull condition evaluation report (summarising the results of class renewal surveys)
- thickness measurement reports.

The survey report file is also to be available in the Owner's management office.

**1.2.3** The following additional supporting documentation is to be available on board:

- survey programme as required by [4.1.1] until such time as the class renewal survey or intermediate survey, as applicable, has been completed
- main structural plans of cargo holds and ballast tanks (for CSR ships, these plans are to include, for each structural element, both the as-built and the renewal thicknesses. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for hold transverse section in all cargo holds)
- previous repair history
- cargo and ballast history
- extent of use of inert gas plant and tank cleaning procedures
- ship's personnel reports on:
  - structural deterioration/defects in general
  - leakage in bulkheads and piping systems
  - condition of corrosion prevention system, if any
- any other information that may help to identify critical structural areas and/or suspect areas requiring inspection.

**1.2.4** For bulk carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10, the Ship Construction File (SCF), limited to the items to be retained onboard, is to be available on board.

**1.2.5** Prior to survey, the Surveyor examines the documentation on board and its contents, which are used as a basis for the survey.

**1.2.6** For bulk carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10:

- on completion of the survey, the surveyor is to verify that the update of the Ship Construction File (SCF) has been done whenever a modification of the documentation included in the SCF has taken place
- for the SCF stored on board ship, the Surveyor is to examine the information on board ship. In cases where any major event, including, but not limited to, substantial repair and conversion, or any modification of the ship structures, the Surveyor is also to verify that the updated information is kept on board the ship. If the updating of the SCF onboard is not completed at the time of survey, the Surveyor records it and requires confirmation at the next periodical survey
- for the SCF stored on shore archive, the Surveyor is to examine the list of information included on shore archive. In cases where any major event, including, but not limited to, substantial repair and conversion, or any modification of the ship structures, the Surveyor is also to verify that the updated information is stored on shore archive by examining the list of information included on shore archive or kept on board the ship. In addition, the surveyor is to confirm that the service contract with of the Archive Center is valid. If the updating of the SCF Supplement ashore is not completed at the time of survey, the Surveyor records it and requires confirmation at the next periodical survey.

**1.2.7** For bulk carriers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10, on completion of the survey, the Surveyor is to verify that any addition and/or renewal of materials used for the construction of the hull structure is/are documented within the SCF list of materials.

### **1.3 Reporting and evaluation of surveys**

**1.3.1** The data and information on the structural condition of the ship collected during survey are evaluated for acceptability and structural integrity of the ship's cargo area.

**1.3.2** For CSR bulk carriers, the ship longitudinal strength is to be evaluated, using thickness of the structural members measured, renewed and reinforced, as appropriate, during the renewal surveys carried out after the ship reached 15 years of age (or during the 3rd renewal survey, if this one is carried out before the ship reaches 15 years), in accordance with the criteria for longitudinal strength of the ship hull girder for CSR bulk carriers specified in NR522 CSR for Bulk Carriers, Chapter 13 or in NR606 CSR for Bulk Carriers and Oil Tankers, Part 1, Chapter 13, as applicable.

**1.3.3** The final result of evaluation of the ship longitudinal strength required in [1.3.2], after renewal or reinforcement work of structural members, if carried out as a result of initial evaluation, is to be reported as a part of the hull condition evaluation report.

**1.3.4** When a survey is split between different survey stations, a report is to be made for each portion of the survey. A list of items examined and/or tested (pressure testing, thickness measurement etc.) and an indication of whether the item has been credited, are to be made available to the next attending Surveyor(s), prior to continuing or completing the survey.

**1.3.5** A hull condition evaluation report (summarising the results of class renewal surveys) is issued by the Society to the Owner, who is to place it on board the ship for reference at future surveys. The hull condition evaluation report is endorsed by the Society.

### **1.4 Conditions for survey**

**1.4.1** In order to enable the attending surveyors to carry out the survey, provisions for proper and safe access are to be agreed between the Owner and the Society.

Details of the means of access are to be provided in the survey planning questionnaire.

In cases where the provisions of safety and required access are judged by the attending surveyor(s) not to be adequate, the survey of the spaces involved is not to proceed.

### **1.5 Access to structures**

**1.5.1** For overall surveys, means are to be provided to enable the Surveyor to examine the hull structure in a safe and practical way.

**1.5.2** For close-up surveys of the hull structure, other than cargo hold shell frames, one or more of the following means for access, acceptable to the Surveyor, is/are to be provided:

- permanent staging and passages through structures
- temporary staging and passages through structures
- hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
- portable ladders
- boats or rafts
- other equivalent means.

**1.5.3** For close-up surveys of the cargo hold shell frames of bulk carriers less than 100,000 dwt, one or more of the following means for access, acceptable to the Surveyor, is/are to be provided:

- permanent staging and passages through structures
- temporary staging and passages through structures
- portable ladder restricted to not more than 5 m in length may be accepted for surveys of lower section of a shell frame including bracket
- hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
- boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water
- other equivalent means.

**1.5.4** For close-up surveys of the cargo hold shell frames of bulk carriers 100,000 dwt and above, the use of portable ladders is not accepted, and one or more of the following means for access, acceptable to the Surveyor, is/are to be provided:

- a) Annual surveys, intermediate surveys for ships less than ten years of age and class renewal surveys for ships five years of age or less:
  - permanent staging and passages through structures
  - temporary staging and passages through structures
  - hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
  - boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water
  - other equivalent means.
- b) Subsequent intermediate surveys and class renewal surveys:
  - either permanent or temporary staging and passages through structures for close-up survey of at least the upper part of hold frames
  - hydraulic arm vehicles such as conventional cherry pickers for surveys of lower and middle part of shell frames as alternative to staging
  - lifts and movable platforms
  - boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water
  - other equivalent means.
- c) Notwithstanding the above requirements:
  - 1) The use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable for the:
    - close-up survey of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approximately the lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold at annual survey of cargo holds for single skin bulk carriers between 10 and 15 years
    - close-up survey of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approximately the lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold and one other selected cargo hold at annual survey of cargo holds for single skin bulk carriers over 15 years.
  - 2) The use of hydraulic arm vehicles or aerial lifts (“Cherry picker”) may be accepted by the attending surveyor for the close-up survey of the upper part of side shell frames or other structures in all cases where the maximum working height is not more than 17 m.

## **2 Annual survey**

### **2.1 General**

**2.1.1** The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file.

### **2.2 Hatch covers and coamings, weather decks**

**2.2.1** Confirmation is to be obtained that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey.

**2.2.2** A thorough survey of cargo hatch covers and coamings is only possible by examination in the open as well as closed positions and is to include verification of proper opening and closing operation. As a result, the hatch cover sets within the forward 25% of the ship's length and at least one additional set, such that all sets on the ship are assessed at least once in every five year period, are to be surveyed open, closed and in operation to the full extent on each direction, including:

- a) stowage and securing in open condition
- b) proper fit and efficiency of sealing in closed condition, and
- c) operational testing of hydraulic and power components, wires, chains, and link drives.

The closing of the covers is to include the fastening of all peripheral, and cross joint cleats or other securing devices. Particular attention is to be paid to the condition of the hatch covers in the forward 25% of the ship's length, where sea loads are normally greatest.

**2.2.3** If there are indications of difficulty in operating and securing hatch covers, additional sets above those required by [2.2.2], at the discretion of the Surveyor, are to be tested in operation.

**2.2.4** Where the cargo hatch securing system does not function properly, repairs are to be carried out under the supervision of the Society.

Where hatch covers or coamings undergo substantial repairs, the strength of securing devices should be upgraded to comply with the requirements laid down in Ch 6, App 1, [6.2], Ch 6, App 1, [6.3] and Ch 6, App 1, [6.4].

**2.2.5** For each cargo hatch cover set, the following items are to be surveyed:

- a) cover panels, including side plates, and stiffener attachments that may be accessible in the open position by close-up survey (for corrosion, cracks, deformation)
- b) sealing arrangements of perimeter and cross joints (gaskets for condition and permanent deformation, flexible seals on combination carriers, gasket lips, compression bars, drainage channels and non return valves)
- c) clamping devices, retaining bars, cleating (for wastage, adjustment, and condition of rubber components)
- d) closed cover locating devices (for distortion and attachment)
- e) chain or rope pulleys
- f) guides
- g) guide rails and track wheels
- h) stoppers
- i) wires, chains, tensioners, and gypsies
- j) hydraulic system, electrical safety devices and interlocks, and
- k) end and interpanel hinges, pins and stools where fitted.

**2.2.6** At each hatchway, the coamings, with plating stiffeners and brackets, are to be checked for corrosion, cracks and deformation, especially of the coaming tops, including close-up survey.

**2.2.7** Where considered necessary, the effectiveness of sealing arrangements may be proved by hose or chalk testing supplemented by dimensional measurements of seal compressing components.

**2.2.8** Where portable covers, wooden or steel pontoons are fitted, checking the satisfactory condition, where applicable, of:

- wooden covers and portable beams, carriers or sockets for the portable beam, and their securing devices
- steel pontoons, including close-up survey of hatchcover plating
- tarpaulins
- cleats, battens and wedges
- hatch securing bars and their securing devices
- loading pads/bars and the side plate edge
- guide plates and chocks
- compression bars, drainage channels and drain pipes (if any).

**2.2.9** The annual survey is also to include:

- examination of flame screens on vents to all bunker tanks
- examination of bunker and vent piping systems, including ventilators
- confirmation, when appropriate and as far as practicable when examining internal spaces, that the means of access to cargo and other spaces remain in good condition.
- examination of watertight penetrations as far as practicable.

## **2.3 Cargo holds**

**2.3.1** The requirements given in Tab 1 for single skin bulk carriers or Tab 2 for double skin bulk carriers are to be complied with.

## **2.4 Ballast tanks**

**2.4.1** Ballast tanks are to be internally examined when required as a consequence of the results of the class renewal survey or the intermediate survey; see [4.3.6] and footnote (3) of Tab 4 for single skin bulk carriers or footnote (3) of Tab 6 for double skin bulk carriers.

**2.4.2** When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tab 12 to Tab 16 for single skin bulk carriers or Tab 17 to Tab 20 for double skin bulk carriers. These extended thickness measurements are to be carried out before the survey is credited as completed.

Suspect areas identified at previous surveys are to be examined.

Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

For ships built under the Common Structural Rules, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition.

**Table 1 : Annual survey of cargo holds for single skin bulk carriers**

Age of ship (in years at time of annual survey)	
10 < age ≤ 15	age > 15
<p>Overall survey of all cargo holds</p> <p>Close-up survey of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approximately the lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold. See (1)</p> <p>See (2) and (3)</p> <p>Examination of all piping and penetrations, including overboard piping, in cargo holds</p>	<p>Overall survey of all cargo holds</p> <p>Close-up survey of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approximately the lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold and one other selected cargo hold. See (1)</p> <p>See (2) and (3)</p> <p>Examination of all piping and penetrations, including overboard piping, in cargo holds</p>
<p>(1) Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining cargo holds.</p> <p>(2) When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is present, the extent of thickness measurements is to be increased in accordance with Tab 12 to Tab 16. These extended thickness measurements are to be carried out before the annual survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.</p> <p>For ships built under the Common Structural Rules, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition.</p> <p>(3) Where a hard protective coating in cargo holds as provided in [1.1.7] is found in good condition, the extent of close-up survey and thickness measurements may be specially considered.</p>	

**Table 2 : Annual survey of cargo holds for double skin bulk carriers**

Age of ship (in years at time of annual survey)	
10 < age ≤ 15	age > 15
<p>Overall survey of two selected cargo holds</p> <p>See (1)</p> <p>Examination of all piping and penetrations, including overboard piping, in cargo holds</p>	<p>Overall survey of all cargo holds</p> <p>See (1)</p> <p>Examination of all piping and penetrations, including overboard piping, in cargo holds</p>
<p>(1) When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tab 17 to Tab 20. These extended thickness measurements are to be carried out before the survey is credited as complete. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.</p> <p>For ships built under the Common Structural Rules, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition.</p>	

### 3 Intermediate survey

#### 3.1 Ships 10 years of age or less

**3.1.1** The requirements for survey of cargo holds given in Tab 3 for single skin bulk carriers or Tab 5 for double skin bulk carriers are to be complied with.

**3.1.2** The requirements for survey of salt water ballast tanks given in Tab 4 for single skin bulk carriers or Tab 6 for double skin bulk carriers are to be complied with.

#### 3.2 Ships between 10 and 15 years of age

**3.2.1** The scope of intermediate survey of ships between 10 and 15 years of age is the scope of the preceding class renewal survey of hull, as detailed in Article [4] with bottom survey in dry condition or bottom in water survey as applicable. However, internal examination of fuel oil tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.

**Table 3 : Intermediate survey of cargo holds for single skin bulk carriers - Ships 10 years of age or less at time of the intermediate survey**

Overall survey of all cargo holds. See (1)
<p>Close-up survey in the forward cargo hold and one other selected cargo hold, to establish the condition of:</p> <ul style="list-style-type: none"> <li>at least 25% of the side shell frames including their upper and lower end attachments, and adjacent shell plating</li> <li>the transverse bulkheads</li> </ul> <p>Examination of suspect areas identified at previous surveys</p> <p>See (1)</p>
Thickness measurements to an extent sufficient to determine both general and local corrosion levels in areas subject to close-up survey. The minimum requirements for thickness measurements are areas found to be suspect areas at the previous surveys. See (2), (3) and (4).
<p>(1) Where considered necessary by the Surveyor as a result of the overall and close-up surveys, the survey is to be extended to include a close-up survey of all the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining cargo holds.</p> <p>(2) Where the hard protective coating in cargo holds as provided in [1.1.7] is found to be in good condition, the extent of close-up survey and thickness measurements may be specially considered.</p> <p>(3) The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution and the hard protective coatings are found to be in a good condition.</p> <p>(4) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tab 12 to Tab 16. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.</p> <p>For ships built under the Common Structural Rules, the identified substantial corrosion areas may be:</p> <ul style="list-style-type: none"> <li>protected by coating, applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in good condition, or, alternatively</li> <li>required to be measured at annual intervals.</li> </ul> <p><b>Note 1:</b> For existing bulk carriers, where Owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the close-up and thickness measurement surveys. Prior to the coating of cargo holds of existing ships, scantlings are to be ascertained in the presence of a Surveyor.</p>

**Table 4 : Intermediate survey of salt water ballast spaces for single skin bulk carriers - Ships 10 years of age or less at time of the intermediate survey**

Overall survey of representative water ballast spaces selected by the Surveyor. The selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks. See (1), (2) and (3)
Overall and close-up survey of suspect areas identified at previous surveys
The minimum requirements for thickness measurements are areas found to be suspect areas at previous surveys. See (4) and (5)
<p>(1) If such overall survey reveals no visible structural defects, the examination may be limited to verification that the corrosion prevention system remains efficient.</p> <p>(2) Where poor coating condition, corrosion or other defects are found in water ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.</p> <p>(3) For ballast tanks other than double bottom tanks, where a hard protective coating is found in poor condition, and it is not renewed, or where soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tanks in question are to be internally examined and thickness measurement carried out as considered necessary at annual surveys.</p> <p>When such breakdown of hard protective coating is found in ballast double bottom tanks or where a soft or semi-hard coating has been applied or where a hard protective coating has not been applied, the tanks in question may be internally examined at annual surveys. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.</p> <p>(4) The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution and the hard protective coatings are found to be in a good condition.</p> <p>(5) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Tab 12 to Tab 16. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.</p>

### 3.3 Ships over 15 years of age

**3.3.1** The scope of intermediate survey of ships over 15 years of age is the scope of the preceding class renewal survey of hull, as detailed in [4] with bottom survey in dry condition. However, internal examination of fuel oil tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.

The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and water ballast tanks are to be carried out during the bottom survey in accordance with the applicable requirements for intermediate surveys, if not already performed.

Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

**Table 5 : Intermediate survey of cargo holds for double skin bulk carriers - Ships 10 years of age or less at time of the intermediate survey**

Overall survey of all cargo holds. See (1)
Thickness measurements to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey. See (2), (3) and (4)
<p>(1) Where considered necessary by the Surveyor as a result of the overall survey, the survey is to be extended to include a close-up survey of those areas of structure in the cargo holds selected by the Surveyor.</p> <p>(2) The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the close-up survey that there is no structural diminution and the hard protective coatings are found to be in a good condition.</p> <p>(3) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tab 17 to Tab 20. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.</p> <p>For ships built under the Common Structural Rules, the identified substantial corrosion areas may be:</p> <ul style="list-style-type: none"> <li>• protected by coating, applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in good condition, or, alternatively</li> <li>• required to be measured at annual intervals.</li> </ul> <p>(4) Where a hard protective coating in cargo holds as provided in [1.1.7] is found in good condition, the extent of close-up survey and thickness measurements may be specially considered.</p> <p><b>Note 1:</b> For existing bulk carriers, where Owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the close-up and thickness measurement surveys. Prior to the coating of cargo holds of existing ships, scantlings are to be ascertained in the presence of a Surveyor.</p>

**Table 6 : Intermediate survey of ballast tanks for double skin bulk carriers - Ships 10 years of age or less at time of the intermediate survey**

Overall survey of representative water ballast tanks selected by the Surveyor. The selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks. See (1), (2) and (3)
Overall and close-up survey of suspect areas identified at previous surveys.
Thickness measurements to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey. See (4) and (5)
<p>(1) If such overall survey reveals no visible structural defects, the examination may be limited to verification that the corrosion prevention system remains efficient.</p> <p>(2) Where poor coating condition, corrosion or other defects are found in water ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.</p> <p>(3) In ballast tanks other than double bottom tanks, where a hard protective coating is found in poor condition and it is not renewed, or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual surveys. When such breakdown of hard protective coating is found in ballast double bottom tanks, or where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied, the tanks in question may be examined at annual surveys. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.</p> <p>(4) The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the close-up survey that there is no structural diminution and the hard protective coatings are found to be in a good condition.</p> <p>(5) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tab 17 to Tab 20. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.</p>

## 4 Class renewal survey

### 4.1 Survey programme and preparation for survey

**4.1.1** The Owner in cooperation with the Society is to work out a specific Survey Programme prior to the commencement of any part of:

- the class renewal survey
- the intermediate survey for bulk carriers over 10 years of age.

The survey programme is to be in a written format. The survey is not to commence until the Survey Programme has been agreed. Prior to the development of the Survey Programme, the survey planning questionnaire is to be completed by the Owner and forwarded to the Society.

The survey programme at intermediate survey may consist of the survey programme at the previous class renewal survey supplemented by the hull condition evaluation report of that class renewal survey and later relevant survey reports.

The survey programme is to be worked out taking into account any amendments to the survey requirements after the last class renewal survey carried out.

**4.1.2** In developing the survey programme, the following documentation is to be collected and consulted with a view to selecting holds, tanks, areas and structural elements to be examined:

- a) survey status and basic ship information
- b) documentation on board, as described in [1.2.2] and [1.2.3]
- c) main structural plans (scantling drawings), including information on use of high tensile steels (HTS)
- d) relevant previous survey and inspection reports from both the Society and the Owner
- e) information regarding the use of ship's holds and tanks, typical cargoes and other relevant data
- f) information regarding corrosion prevention level on the newbuilding
- g) information regarding the relevant maintenance level during operation.

**4.1.3** The submitted Survey Programme is to account for and comply, as a minimum, with the requirements of [4.5], [4.6] and [4.7], for close-up survey, thickness measurement and tank testing, respectively, and is to include relevant information including at least:

- a) basic ship information and particulars
- b) main structural plans (scantling drawings), including information regarding use of high tensile steels (HTS)
- c) plan of holds and tanks
- d) list of holds and tanks with information on use, protection and condition of coating
- e) conditions for survey (e.g. information regarding hold and tank cleaning, gas freeing, ventilation, lighting, etc.)
- f) provisions and methods for access to structures
- g) equipment for surveys
- h) nomination of holds and tanks and areas for close-up surveys according to [4.5]
- i) nomination of sections for thickness measurements according to [4.6]
- j) nomination of tanks for tank testing according to [4.7]
- k) damage experience related to the ship in question.

**4.1.4** The Society is to advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the ship.

### 4.2 Survey planning meeting

**4.2.1** The establishment of proper preparation and the close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board, safety meetings are to be held regularly.

**4.2.2** Prior to commencement of any part of the renewal and intermediate survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement firm representative, where involved, and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out. See also Ch 2, Sec 2, [2.3.2].

**4.2.3** The following is an indicative list of items that are to be addressed in the meeting:

- a) schedule of the ship (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.)
- b) provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety)
- c) extent of the thickness measurements
- d) acceptance criteria (refer to the list of minimum thicknesses)
- e) extent of close-up survey and thickness measurements considering the coating condition and suspect areas/areas of substantial corrosion
- f) execution of thickness measurements
- g) taking representative readings in general and where uneven corrosion/pitting is found
- h) mapping of areas of substantial corrosion, and
- i) communication between attending surveyor(s), the thickness measurement firm operator(s) and owner representative(s) concerning findings.

### **4.3 Scope of survey**

**4.3.1** In addition to the requirements of annual surveys, the class renewal survey is to include examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in [4.3.3] is in satisfactory condition for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

**4.3.2** All cargo holds, ballast tanks, including double bottom tanks, double side tanks as applicable, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing required in [4.6] and [4.7], to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration that may be present.

**4.3.3** All piping systems within the above spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

**4.3.4** The survey extent of ballast tanks converted to void spaces will be specially considered by the Society in relation to the requirements for ballast tanks.

**4.3.5** As indicated in Ch 3, Sec 3, [2.1.1], a bottom survey in dry condition is to be a part of the class renewal survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks are to be carried out during this bottom survey in accordance with the applicable requirements for class renewal surveys, if not already performed.

Note 1: Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

**4.3.6** Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined.

For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in poor condition, and it is not renewed, where soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question are to be examined at annual surveys. Thickness measurement are to be carried out as deemed necessary by the Surveyor.

When such a breakdown of hard protective coating is found in water ballast double bottom tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question may be examined at annual surveys. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement are to be carried out.

**4.3.7** Where hard protective coating in cargo holds, as provided in [1.1.7], is found in good condition, the extent of close-up surveys and thickness measurements may be specially considered.

### **4.4 Hatch covers and coamings**

**4.4.1** A survey of the items listed in [2.2] is to be carried out, in addition to all hatch covers and coamings.

**4.4.2** Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:

- stowage and securing in open condition
- proper fit and efficiency of sealing in closed condition
- operational testing of hydraulic and power components, wires, chains, and link drives.

**4.4.3** Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.

**4.4.4** The close-up survey and thickness measurements in accordance with the requirements given in Tab 8, Tab 9, Tab 10 and Tab 11, respectively, are to be carried out.

Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/ thickness measurement is to be done of the accessible parts of hatch cover structures.

**4.5 Overall and close-up surveys**

**4.5.1** An overall survey of all tanks and spaces is to be carried out at each class renewal survey. Fuel oil tanks in the cargo length area are to be surveyed as per Tab 7.

**4.5.2** The minimum requirements for close-up surveys are given in Tab 8 for single skin bulk carriers, in Tab 9 for double skin bulk carriers excluding ore carriers and in Tab 10 for ore carriers.

**4.5.3** The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

**4.5.4** For areas in spaces where hard protective coatings are found to be in a good condition, the extent of close-up surveys according to Tab 8 for single skin bulk carriers Tab 9 for double skin bulk carriers excluding ore carriers and Tab 10 for ore carriers, may be specially considered. Refer also to [4.3.7].

**Table 7 : Requirements for internal examination of fuel oil tanks in the cargo length area**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 & subsequent age > 15
none	one	two (1)	half (min. two) (1)
<p>(1) One deep tank for fuel oil in the cargo area is to be included, if fitted.  <b>Note 1:</b> Tanks considered are of the integral (structural) type.  <b>Note 2:</b> If a selection of tanks is accepted to be examined, then different tanks are to be examined at each class renewal survey, on a rotational basis.  <b>Note 3:</b> Peak tanks (all uses) are subject to internal examination at each class renewal survey.</p>			

**Table 8 : Requirements for close-up survey at class renewal survey of single skin bulk carriers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
25% of shell frames in the forward cargo hold at representative positions ① Selected shell frames in all remaining cargo holds ①	All shell frames in the forward cargo hold and 25% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating ① For bulk carriers 100,000 dwt and above, all shell frames in the forward cargo hold and 50% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating ①	All shell frames in the forward and one other selected cargo hold and 50% of shell frames in each of the remaining cargo holds including upper and lower end attachments and adjacent shell plating ①	All shell frames in all cargo holds including upper and lower end attachments and adjacent shell plating ①

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
One transverse web with associated plating and longitudinals in two representative water ballast tanks of each type (i.e. topside or hopper side tank) ②	One transverse web with associated plating and longitudinals in each water ballast tank ②  Forward and aft transverse bulkheads in one ballast tank, including stiffening system ②	All transverse webs with associated plating and longitudinals in each water ballast tank ②  All transverse bulkheads in ballast tanks, including stiffening system ②	Areas ② to ⑤ as for class renewal survey for ships between 10 and 15 years of age
Two selected cargo hold transverse bulkheads ③	All cargo hold transverse bulkheads ③	All cargo hold transverse bulkheads ③	
All cargo hold hatch covers and coamings ④	All cargo hold hatch covers and coamings ④	All cargo hold hatch covers and coamings ④	
	All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches ⑤	All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches ⑤	

**Note 1:** See Fig 1 for areas ①, ②, ③, ④ and ⑤. See also Ch 6, Sec 2, Fig 3 for zones of side shell frames for ships subject to compliance with Ch 6, Sec 2, [5].

① Cargo hold transverse frames.

② Transverse web frame or transverse watertight bulkhead in water ballast tanks.

③ Cargo hold transverse bulkhead plating, stiffeners and girders, including internal structure of upper and lower stools, where fitted.

④ Cargo hold hatch covers and coamings (plating and stiffeners). Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement is to be done of the accessible parts of hatch cover structures.

⑤ Deck plating and under deck structure inside line of hatch openings between cargo hold hatches.

**Note 2:** Close-up survey of transverse bulkheads to be carried out at four levels (see Fig 2):

- immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for bulkheads without lower stool
- immediately above and below the lower stool shelf plate (for bulkheads fitted with lower stools), and immediately above the line of the shedder plates
- about mid-height of the bulkhead
- immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate for bulkheads fitted with upper stools, or immediately below the top side tanks.

**Figure 1 : Close-up surveys and thickness measurement areas for single skin bulk carriers**

**Table 9 : Requirements for close-up survey at class renewal survey of double skin bulk carriers, excluding ore carriers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
One transverse web with associated plating and longitudinals in two representative water ballast tanks of each type (this is to include the foremost topside and double side water ballast tanks on either side) ①	One transverse web with associated plating and longitudinals as applicable in each water ballast tank ①  Forward and aft transverse bulkheads including stiffening system in a transverse section including topside, hopper side and double side ballast tanks, on one side of the ship (i.e. port or starboard) ①	All transverse webs with associated plating and longitudinals as applicable in each water ballast tank ①  All transverse bulkheads including stiffening system in each water ballast tank ①	All transverse webs with associated plating and longitudinals as applicable in each water ballast tank ①  All transverse bulkheads including stiffening system in each water ballast tank ①
	25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in the foremost double side tanks ②	25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in all double side tanks ②	All ordinary transverse frames for transverse framing system or all longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts, in all double side tanks ②
Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted ③	One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted ③	All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted ③	Areas ③ to ⑤ as for class renewal survey for ships between 10 and 15 years of age
All cargo hold hatch covers and coamings (platings and stiffeners) ④	All cargo hold hatch covers and coamings (platings and stiffeners) ④	All cargo hold hatch covers and coamings (platings and stiffeners) ④	
	All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches ⑤	All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches ⑤	

**Note 1:** See Fig 4 and Fig 3 for areas ①, ②, ③, ④ and ⑤.

- ① Transverse web frame or watertight transverse bulkhead in topside, hopper side and double side ballast tanks. In fore and aft peak tanks, transverse web frame means a complete transverse web frame ring including adjacent structural members.
- ② Ordinary transverse frame in double side tanks.
- ③ Cargo hold transverse bulkheads plating, stiffeners and girders.
- ④ Cargo hold hatch covers and coamings. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement is to be done of the accessible parts of hatch cover structures.
- ⑤ Deck plating and underdeck structure inside line of hatch openings between cargo hold hatches.

**Note 2:** Close-up survey of transverse bulkheads to be carried out at four levels (see Fig 2):

- immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower tool
- immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates
- about mid-height of the bulkhead
- immediately below the upper deck plating and immediately adjacent to the upper wing tank, and immediately below the upper stool shelf plate (for those ships fitted with upper stools), or immediately below the topside tanks.

Figure 4 : Areas subject to close-up surveys and thickness measurements for double skin bulk carriers

## 4.6 Thickness measurements

### 4.6.1 The minimum requirements for thickness measurements at class renewal survey are given in Tab 11.

Note 1: Attention is drawn to specific thickness measurements to be carried out on the bulkhead between the two foremost cargo holds for ships which are to comply with retroactive requirements as detailed in Ch 6, Sec 2, [1.3] and to additional thickness measurements applicable to the side shell frames and brackets on ships subject to compliance with Ch 6, Sec 2, [5].

**Table 11 : Requirements for thickness measurements at class renewal survey of bulk carriers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
Suspect areas	Suspect areas	Suspect areas	Suspect areas
	Within the cargo length area: <ul style="list-style-type: none"> <li>two transverse sections of deck plating outside line of cargo hatch openings <b>(1)</b></li> </ul>	Within the cargo length area: <ul style="list-style-type: none"> <li>each deck plate outside line of cargo hatch openings</li> <li>two transverse sections, one in the amidship area, outside line of cargo hatch openings, <b>(1)</b></li> </ul>	Within the cargo length area: <ul style="list-style-type: none"> <li>each deck plate outside line of cargo hatch openings</li> <li>three transverse sections, one in the amidship area, outside line of cargo hatch openings, <b>(1)</b></li> <li>each bottom plate</li> </ul>
	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 8 or Tab 9 or Tab 10, as applicable	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 8 or Tab 9 or Tab 10, as applicable	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 8 or Tab 9 or Tab 10, as applicable
	Wind and water strakes in way of the transverse sections considered above	All wind and water strakes within the cargo area	All wind and water strakes, full length
	Selected wind and water strakes outside the cargo area	Selected wind and water strakes outside the cargo area	
		Additional thickness measurements given in Ch 6, Sec 2, [1.3] are to be taken on the transverse watertight bulkhead between the two foremost cargo holds on ships to which the requirements given in Ch 6, Sec 2, [1.1.1] apply	Additional thickness measurements given in Ch 6, Sec 2, [1.3] are to be taken on the transverse watertight bulkhead between the two foremost cargo holds on ships to which the requirements given in Ch 6, Sec 2, [1.1.1] apply
	Additional thickness measurements given in Ch 6, Sec 2, [5.3] are to be taken on the side shell frames and brackets on ships subject to compliance with Ch 6, Sec 2, [5]	Additional thickness measurements given in Ch 6, Sec 2, [5.3] are to be taken on the side shell frames and brackets on ships subject to compliance with Ch 6, Sec 2, [5]	Additional thickness measurements given in Ch 6, Sec 2, [5.3] are to be taken on the side shell frames and brackets on ships subject to compliance with Ch 6, Sec 2, [5]
<b>(1)</b> Transverse sections are to be chosen where largest reductions are suspected to occur or are revealed from deck plating measurements, one of which is to be in the midship area.			

**4.6.2** Provisions for extended measurements for areas with substantial corrosion are given in Tab 12 to Tab 20 and as may be additionally specified in the survey programme as required by [4.1]. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

Note 1: For ships built under the Common Structural Rules, the identified substantial corrosion areas may be:

- protected by coating, applied in accordance with the coating manufacturer’s requirements and examined at annual intervals to confirm the coating in way is still in good condition, or, alternatively
- required to be measured at annual intervals.

**4.6.3** The Surveyor may further extend the thickness measurements as deemed necessary.

**4.6.4** When pitting is found on bottom plating and its intensity is 20% or more, thickness measurements are to be extended in order to determine the actual plate thickness out of the pits and the depth of the pits. Where the wastage is in the substantial corrosion range or the average depth of pitting is 1/3 or more of the actual plate thickness, the pitted plate is to be considered as a substantially corroded area.

**4.6.5** For areas in tanks where hard protective coatings are found to be in a good condition (see Ch 2, Sec 2, [2.2.14]), the extent of thickness measurements according to Tab 11 may be specially considered by the Society. Refer also to [4.3.7].

**Table 12 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of single skin bulk carriers within the cargo area**

BOTTOM AND SIDE SHELL STRUCTURES		
Structural member	Extent of measurement	Pattern of measurement
Bottom and side shell plating	Suspect plate, plus 4 adjacent plates See other tables for particulars on gauging in way of tanks and cargo holds	5-point pattern for each panel between longitudinals
Bottom and side shell longitudinals	Minimum of 3 longitudinals in way of suspect areas	3 measurements in line across web 3 measurements on flange

**Table 13 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of single skin bulk carriers within the cargo area**

TRANSVERSE BULKHEADS IN CARGO HOLDS		
Structural member	Extent of measurement	Pattern of measurement
Lower stool	Transverse band within 25 mm of welded connection to inner bottom Transverse band within 25 mm of welded connection to shelf plate	5-point pattern between stiffeners over one metre length 5-point pattern between stiffeners over one metre length
Transverse bulkhead	Transverse band at approximately mid-height Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for bulkheads fitted with lower stool)	5-point pattern over 1 m <sup>2</sup> of plating 5-point pattern over 1 m <sup>2</sup> of plating

**Table 14 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of single skin bulk carriers within the cargo area**

DECK STRUCTURE AND HATCH COVERS		
Structural member	Extent of measurement	Pattern of measurement
Cross deck strip plating	Suspect cross deck strip plating	5-point pattern between underdeck stiffeners over one metre length
Underdeck stiffeners	Transverse members Longitudinal members	5-point pattern at each end and mid-span 5-point pattern on both web and flange
Hatch covers	Skirt: 3 locations on each side and each end 3 longitudinal bands, outboard strakes (2) and centreline strake (1)	5-point pattern at each location 5-point measurement each band
Hatch coamings	Both sides and ends of coaming: one band lower 1/3 and one band upper 2/3 of coaming	5-point measurement each band
Topside water ballast tanks	Transverse watertight bulkhead: (a) lower 1/3 of bulkhead (b) upper 2/3 of bulkhead (c) stiffeners	(a) 5-point pattern over 1 m <sup>2</sup> of plating (b) 5-point pattern over 1 m <sup>2</sup> of plating (c) 5-point pattern over 1 m length
	Two representative transverse wash bulkheads: (a) lower 1/3 of bulkhead (b) upper 2/3 of bulkhead (c) stiffeners	(a) 5-point pattern over 1 m <sup>2</sup> of plating (b) 5-point pattern over 1 m <sup>2</sup> of plating (c) 5-point pattern over 1 m length
	Three representative bays of sloped plating: (a) lower 1/3 of tank (b) upper 2/3 of tank	(a) 5-point pattern over 1 m <sup>2</sup> of plating (b) 5-point pattern over 1 m <sup>2</sup> of plating
	Longitudinals: suspect and adjacent	5-point pattern both web and flange over 1 m length
Main deck plating	Suspect plates and adjacent	5-point pattern over 1 m <sup>2</sup> of plating
Main deck longitudinals	Minimum of 3 longitudinals where plating measured	5-point pattern both web and flange over 1 m length
Web frames/transverses	Suspect plates	5-point pattern over 1 m <sup>2</sup> of plating

**Table 15 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of single skin bulk carriers within the cargo area**

DOUBLE BOTTOM AND HOPPER STRUCTURE		
Structural member	Extent of measurement	Pattern of measurement
Inner bottom plating	Suspect plate plus all adjacent plates	5-point pattern for each panel between longitudinals over one metre length
Inner bottom longitudinals	Three longitudinals where plates measured	3 measurements in line across and 3 measurements on flange
Longitudinal girders and transverse floors	Suspect plates	5-point pattern over approximately 1 m <sup>2</sup> of plating
Watertight bulkheads (floors and girders)	(a) lower 1/3 of tank (b) upper 2/3 of tank	(a) 5-point pattern over 1 m <sup>2</sup> of plating (b) 5-point pattern alternate plates over 1 m <sup>2</sup> of plating
Transverse web frames	Suspect plate	5-point pattern over 1 m <sup>2</sup> of plating

**Table 16 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of single skin bulk carriers within the cargo area**

CARGO HOLDS		
Structural member	Extent of measurement	Pattern of measurement
Side shell frames	Suspect frame and each adjacent	(a) At each end and mid-span: 5-point pattern of both web and flange (b) 5-point pattern within 25 mm of welded attachment to both shell and lower sloped plate

**Table 17 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of double skin bulk carriers within the cargo length area**

BOTTOM, INNER BOTTOM AND HOPPER STRUCTURE		
Structural member	Extent of measurement	Pattern of measurement
Bottom, inner bottom and hopper structure plating	Minimum of 3 bays across double bottom tank, including aft bay Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
Bottom, inner bottom and hopper structure longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on the vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements
Bottom floors, including the watertight ones	3 floors in the bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over 2 square metre area
Hopper structure web frame ring	3 floors in the bays where bottom plating measured	5-point pattern over 1 square metre of plating Single measurements on flange
Hopper structure transverse watertight bulkhead or swash bulkhead	<ul style="list-style-type: none"> <li>• lower 1/3 of bulkhead</li> <li>• upper 2/3 of bulkhead</li> <li>• stiffeners (minimum of 3)</li> </ul>	5-point pattern over 1 square metre of plating 5-point pattern over 2 square metre of plating for web, 5-point pattern over span (2 measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
Panel stiffening	Where applicable	Single measurements

**Table 18 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of double skin bulk carriers within the cargo length area**

DECK STRUCTURE INCLUDING CROSS STRIPS, MAIN CARGO HATCHWAYS, HATCH COVERS, COAMINGS AND TOPSIDE TANKS		
Structural member	Extent of measurement	Pattern of measurement
Cross deck strip plating	Suspect cross deck strip plating	5-point pattern between underdeck stiffeners over 1 metre length
Underdeck stiffeners	Transverse members Longitudinal members	5-point pattern at each end and mid span 5-point pattern on both web and flange
Hatch covers	Side and end skirts, each 3 locations 3 longitudinal bands: 2 outboard strakes and 1 centreline strake	5-point pattern at each location 5-point measurement each band
Hatch coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5-point measurement each band i.e. end or side coaming
Topside ballast tanks	a) Watertight transverse bulkheads: <ul style="list-style-type: none"> <li>• lower 1/3 of bulkhead</li> <li>• upper 2/3 of bulkhead</li> <li>• stiffeners</li> </ul>	5-point pattern over 1 square metre of plating 5-point pattern over 1 square metre of plating 5-point pattern over 1 metre length
Topside ballast tanks	b) Two representative swash transverse bulkheads: <ul style="list-style-type: none"> <li>• lower 1/3 of bulkhead</li> <li>• upper 2/3 of bulkhead</li> <li>• stiffeners</li> </ul>	5-point pattern over 1 square metre of plating 5-point pattern over 1 square metre of plating 5-point pattern over 1 metre length
Topside ballast tanks	c) Three representative bays of slope plating: <ul style="list-style-type: none"> <li>• lower 1/3 of tank</li> <li>• upper 2/3 of tank</li> </ul>	2 5-point pattern over 1 square metre of plating 5-point pattern over 1 square metre of plating
Topside ballast tanks	d) Longitudinals, suspect and adjacent	5-point pattern on both web and flange over 1 metre length
Main deck plating	Suspect plates and adjacent (4)	5-point pattern over 1 square metre of plating
Main deck longitudinals	Suspect plates	5-point pattern on both web and flange over 1 metre length
Web frames / Transverses	Suspect plates	5-point pattern over 1 square metre

**4.6.6** For single skin bulk carriers, representative thickness measurements to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and water ballast tanks is to be carried out. For double skin bulk carriers, representative thickness measurement to determine both general and local levels of corrosion in the transverse web frames in all water ballast tanks is to be carried out.

Thickness measurements is also to be carried out to determine the corrosion levels on the transverse bulkhead plating. The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution, and the hard protective coating where applied remains efficient.

## 4.7 Tank testing

**4.7.1** All boundaries of water ballast tanks, deep tanks and cargo holds used for water ballast within the cargo length area are to be pressure tested. For fuel oil tanks, only representative tanks are to be pressure tested.

**4.7.2** The Surveyor may extend the tank testing as deemed necessary.

**4.7.3** Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.

Boundaries of ballast holds are to be tested with a head of liquid to near to the top of hatches.

Boundaries of fuel oil tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.

**4.7.4** The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tanktop is carried out.

**Table 19 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of double skin bulk carriers within the cargo length area**

STRUCTURE IN DOUBLE SIDE SPACES OF DOUBLE SKIN BULK CARRIERS INCLUDING WING VOID SPACES OF ORE CARRIERS		
Structural member	Extent of measurement	Pattern of measurement
Side shell and inner plating: <ul style="list-style-type: none"> <li>• upper strake and strakes in way of horizontal girders</li> <li>• all other strakes</li> </ul>	<ul style="list-style-type: none"> <li>• plating between each pair of transverse frames/longitudinals in a minimum of 3 bays (along the tank)</li> <li>• plating between every third pair of longitudinals in same 3 bays</li> </ul>	<ul style="list-style-type: none"> <li>• Single measurement</li> <li>• Single measurement</li> </ul>
Side shell and inner side transverse frames / longitudinals on: <ul style="list-style-type: none"> <li>• upper strake</li> <li>• all other strakes</li> </ul>	<ul style="list-style-type: none"> <li>• each transverse frame/longitudinal in same 3 bays</li> <li>• every third transverse frame/longitudinal in same 3 bays</li> </ul>	<ul style="list-style-type: none"> <li>• 3 measurements across web and 1 measurement on flange</li> <li>• 3 measurements across web and 1 measurement on flange</li> </ul>
Transverse frames / longitudinals: <ul style="list-style-type: none"> <li>• brackets</li> </ul>	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5-point pattern over area of bracket
Vertical web and transverse bulkheads: <ul style="list-style-type: none"> <li>• strakes in way of horizontal girders</li> <li>• other strakes</li> </ul>	<ul style="list-style-type: none"> <li>• minimum of 2 webs and both transverse bulkheads</li> <li>• minimum of 2 webs and both transverse bulkheads</li> </ul>	<ul style="list-style-type: none"> <li>• 5-point pattern over approx. 2 square metre area</li> <li>• 2 measurements between each pair of vertical stiffeners</li> </ul>
Horizontal girders	Plating on each girder in a minimum of 3 bays	2 measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements

Class renewal survey of double skin bulk carriers within the cargo length area**

TRANSVERSE BULKHEADS IN CARGO HOLDS		
Structural member	Extent of measurement	Pattern of measurement
Lower stool, where fitted	<ul style="list-style-type: none"> <li>• transverse band within 25 mm of welded connection to inner bottom</li> <li>• transverse band within 25 mm of welded connection to shelf plate</li> </ul>	<ul style="list-style-type: none"> <li>• 5-point pattern between stiffeners over 1 metre length</li> <li>• 5-point pattern between stiffeners over 1 metre length</li> </ul>
Transverse bulkheads	<ul style="list-style-type: none"> <li>• transverse band at approx. mid height</li> <li>• transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)</li> </ul>	<ul style="list-style-type: none"> <li>• 5-point pattern over 1 square metre of plating</li> <li>• 5-point pattern over 1 square metre of plating</li> </ul>

# Section 3 Oil Tankers and Combination Carriers

## 1 General

### 1.1 Application

**1.1.1** The requirements of this Section apply to all self-propelled ships which have been assigned one of the following service notations:

- **oil tanker ESP** (whether of single or double hull construction)
- **combination carrier/OBO ESP**
- **combination carrier/OOC ESP.**

Note 1: A double hull oil tanker is a ship which is constructed primarily for the carriage of oil (MARPOL Annex I cargoes) in bulk, which have the cargo tanks protected by a double hull which extends for the entire length of the cargo area, consisting of double sides and double bottom spaces for the carriage of water ballast or void spaces. The requirements of this Section for double hull tankers are also applicable to existing double hull tankers not complying with MARPOL Regulation 13F, but having a U-shaped midship section.

**1.1.2** Ships granted with the service notation **oil storage service** are only concerned by the requirements laid down in [6] for class hull renewal surveys.

**1.1.3** The requirements for hull surveys apply to the surveys of the hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels and void spaces within the cargo area and all ballast tanks. They are additional to the requirements applicable to the remainder of the ship, given in Part A, Chapter 3 according to the relevant surveys.

**1.1.4** The requirements contain the minimum extent of examination, thickness measurements and tank testing. When substantial corrosion, as defined in Ch 2, Sec 2, [2.2.7], and/or structural defects are found, the survey is to be extended and is to include additional close-up surveys when necessary.

**1.1.5** In any kind of survey, i.e. class renewal, intermediate, annual or other surveys having the same scope, thickness measurements, when required by Tab 3, of structures in areas where close-up surveys are required are to be carried out simultaneously with close-up surveys.

**1.1.6** In all cases the extent of thickness measurements is to be sufficient as to represent the actual average condition.

**1.1.7** When, in any survey, thickness measurements are required:

- the procedure detailed in Ch 2, Sec 2, [2.3] is to be applied
- the thickness measurement firm is to be part of the survey planning meeting to be held prior to commencing the survey.

**1.1.8** The requirements for machinery surveys apply to surveys of the machinery and equipment in the cargo area or dedicated to cargo service systems and are additional to those given in Part A, Chapter 3 for all ships.

### 1.2 Documentation on board

**1.2.1** The Owner is to obtain, supply and maintain documentation on board as specified in [1.2.2] and [1.2.3], which is to be readily available for examination by the Surveyor. The documentation is to be kept on board for the lifetime of the ship.

For oil tankers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10, the Owner is to arrange the updating of the Ship Construction File (SCF) throughout the ship's life whenever a modification of the documentation included in the SCF has taken place. Documented procedures for updating the SCF are to be included within the Safety Management System.

**1.2.2** A survey report file is to be a part of the documentation on board consisting of:

- reports of structural surveys
- hull condition evaluation report (summarising the results of class renewal surveys)
- thickness measurement reports.

The survey report file is also to be available in the Owner's management office.

**1.2.3** The following additional supporting documentation is to be available on board:

- main structural plans of cargo and ballast tanks (for CSR ships, these plans are to include, for each structural element, both the as-built and the renewal thicknesses. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for the tank transverse section in all cargo tanks)
- previous repair history

- cargo and ballast history
- extent of use of inert gas system and tank cleaning procedures
- ship's personnel reports on:
  - structural deterioration/defects in general
  - leakage in bulkheads and piping systems
  - condition of coatings or corrosion prevention systems, if any
- survey program, as required in [6.1], until such time as the class renewal survey or intermediate survey, as applicable, has been completed
- any other information that may help to identify critical structural areas and/or suspect areas requiring inspection.

**1.2.4** For oil tankers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10, the Ship Construction File (SCF), limited to the items to be retained onboard, is to be available on board.

**1.2.5** Prior to survey, the Surveyor examines the documentation on board and its contents, which are used as a basis for the survey.

**1.2.6** For oil tankers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10:

- on completion of the survey, the Surveyor is to verify that the update of the Ship Construction File (SCF) has been done whenever a modification of the documentation included in the SCF has taken place.
- for the SCF stored on board ship, the Surveyor is to examine the information on board ship. In cases where any major event, including, but not limited to, substantial repair and conversion, or any modification of the ship structures, the Surveyor is also to verify that the updated information is kept on board the ship. If the updating of the SCF onboard is not completed at the time of survey, the Surveyor records it and requires confirmation at the next periodical survey
- for the SCF stored on shore archive, the Surveyor is to examine the list of information included on shore archive. In cases where any major event, including, but not limited to, substantial repair and conversion, or any modification of the ship structures, the Surveyor is also to verify that the updated information is stored on shore archive by examining the list of information included on shore archive or kept on board the ship. In addition, the surveyor is to confirm that the service contract with of the Archive Center is valid. If the updating of the SCF Supplement ashore is not completed at the time of survey, the Surveyor records it and requires confirmation at the next periodical survey.

**1.2.7** For oil tankers subject to SOLAS Chapter II-1 Part A-1 Regulation 3-10, on completion of the survey, the Surveyor is to verify that any addition and/or renewal of materials used for the construction of the hull structure is/are documented within the SCF inventory list.

### **1.3 Reporting and evaluation of surveys**

**1.3.1** The data and information on the structural condition of the ship collected during survey are evaluated for acceptability and structural integrity of the ship's cargo area.

**1.3.2** In case of oil tankers of 130 m in length and upwards (as defined in the International Convention on Load Lines in force), the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the class renewal survey carried out after the ship reached 10 years of age in accordance with the criteria for longitudinal strength of the ship's hull girder for oil tankers specified in Ch 4, App 1.

The final result of evaluation of the ship's longitudinal strength, after renewal or reinforcement work of structural members, if carried out as a result of initial evaluation, is to be reported as a part of the hull condition evaluation report.

**1.3.3** When a survey is split between different survey stations, a report is to be made for each portion of the survey. A list of items examined and/or tested (pressure testing, thickness measurements etc.) and an indication of whether the item has been credited, are to be made available to the next attending Surveyor(s), prior to continuing or completing the survey.

**1.3.4** A hull condition evaluation report (summarizing the results of class renewal surveys) is issued by the Society to the Owner, who is to place it on board the ship for reference at future surveys. The hull condition evaluation report is endorsed by the Society.

### **1.4 Conditions for survey**

**1.4.1** In order to enable the attending surveyor(s) to carry out the survey, provisions for proper and safe access are to be agreed between the Owner and the Society.

Details of the means of access are to be provided in the survey planning questionnaire.

In cases where the provisions of safety and required access are judged by the attending surveyor(s) not to be adequate, the survey of the spaces involved is not to proceed.

### **1.5 Access to structures**

**1.5.1** For overall survey, means are to be provided to enable the surveyor(s) to examine the hull structure in a safe and practical way.

**1.5.2** For close-up survey, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

- permanent staging and passages through structures
- temporary staging and passages through structures
- hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
- boats or rafts
- portable ladders
- other equivalent means.

## **2 Annual survey - Hull items**

### **2.1 General**

**2.1.1** The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file.

### **2.2 Weather decks**

**2.2.1** The survey is to include:

- examination of cargo tank openings, including gaskets, covers, coamings and screens
- examination of cargo tank pressure/vacuum valves and flame screens
- examination of flame screens on vents to all bunker, oily-ballast and oily slop tanks and void spaces
- examination of cargo, crude oil washing, bunker, ballast and vent piping systems, including remote control valves, safety valves and various safety devices, as well as vent masts and headers
- confirmation that wheelhouse doors and windows, sidescuttles and windows in superstructure and deckhouse ends facing the cargo area are in satisfactory condition
- confirmation that the requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained
- examination of the cargo tank venting, purging and gas freeing systems and other ventilation systems
- examination, for oil tankers of 150 m in length and above, where appropriate, of the ship's structure in accordance with the Ship Construction File, taking into account identified areas that need special attention.
- examination of watertight penetrations as far as practicable.

### **2.3 Cargo pump rooms and pipe tunnels**

**2.3.1** The survey is to include:

- examination of all pump room bulkheads and pipe tunnels (if any) for signs of oil leakage or fractures and, in particular, the sealing arrangements of penetrations in these bulkheads
- examination of the condition of all piping systems, in cargo pump rooms and pipe tunnels (if any)
- examination of the bilge and ballast arrangements.

### **2.4 Ballast tanks**

**2.4.1** Ballast tanks are to be internally examined when required as a consequence of the results of the class renewal survey or the intermediate survey.

**2.4.2** When considered necessary by the Surveyor, or when extensive corrosion exists, thickness measurements are to be carried out and if the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Tab 4 or Tab 5. These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

**2.4.3** For ships built under the Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out.

**2.4.4** For ships with dedicated ballast water tanks, confirmation, through documentary evidence, that the corrosion prevention system fitted to these dedicated ballast water tanks has been maintained.

## **2.5 Emergency towing arrangement**

**2.5.1** The Owner or his representative is to declare to the attending Surveyor that no significant alterations have been made, without prior approval from the Society, to the equipment and arrangements fitted on board in accordance with the provisions given in Pt B, Ch 12, Sec 4, [3].

**2.5.2** The survey is to include:

- an examination, as far as practicable, of the emergency towing arrangement
- confirmation that the aft towing arrangement is pre-rigged and forward chafing gear is secured to the strong-point
- confirmation of the proper functioning of the light, where it is provided, on the pick-up gear marker buoy.

## **2.6 Safe access to tanker bows**

**2.6.1** The access to bow arrangement is to be examined, as applicable.

## **2.7 Means of access**

**2.7.1** When appropriate and as far as practicable when examining internal spaces, the condition of the means of access to cargo and other spaces is to be ascertained.

## **2.8 Coating systems**

**2.8.1** When appropriate, confirmation that the coating system in cargo oil tanks of crude oil tankers, is maintained and that in-service maintenance and repair activities are recorded in the coating technical file.

# **3 Annual survey - Cargo machinery items**

## **3.1 Cargo area and cargo pump rooms**

**3.1.1** The Owner or his representative is to declare to the attending Surveyor that no modifications or alterations which might impair safety have been made to the various installations in dangerous zones without prior approval from the Society.

The survey is to include:

- check of the protection of cargo pump room, as applicable, and in particular, check of:
  - temperature sensing devices for bulkheads glands and alarms
  - interlock between lighting and ventilation
  - gas detection system
  - bilge level monitoring devices and alarms
- examination of the emergency lighting in cargo pump rooms of ships constructed after 1<sup>st</sup> July 2002
- confirmation that potential sources of ignition in or near the cargo pump rooms, such as loose gear, excessive product in bilge, excessive vapours, combustible materials, etc., are eliminated and that access ladders are in satisfactory condition
- examination, as far as practicable, of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of the pump room bilge system, and checking that pump foundations are intact
- confirmation that the ventilation system, including portable equipment, if any, of all spaces in the cargo area (including cargo pump rooms) is operational, ducting is intact, dampers are operational and screens are clean
- confirmation that electrical equipment in dangerous zones, cargo pump rooms and other spaces is in satisfactory condition and has been properly maintained
- confirmation that the remote operation of the cargo pump room bilge system is satisfactory
- examination of the cargo heating system, as appropriate
- examination of the cargo-transfer arrangement and confirmation that the ship's cargo hoses are suitable for their intended purpose and in satisfactory condition
- confirmation that any special arrangement made for bow or stern loading/unloading is in satisfactory condition and test of the means of communication and remote shutdown of the cargo pumps.

## **3.2 Instrumentation and safety devices**

**3.2.1** The survey is to include:

- examination of cargo tank gauging devices, high level alarms and valves associated with overflow control
- verification that installed pressure gauges on cargo discharge lines are properly operational
- confirmation that the required gas detection instruments are on board and satisfactory arrangements have been made for the supply of any required vapour detection tubes

- confirmation that at least one (1) portable instrument for measuring oxygen and one (1) for measuring flammable vapour concentrations, together with a sufficient set of spares, and suitable means of calibration of these instruments are available on board
- examination of the arrangements for gas measurement in double-hull spaces and double bottom spaces, including the fitting of permanent gas sampling lines, where appropriate
- examination as far as possible, and testing of the fixed hydrocarbon gas detection system
- confirmation that devices provided for measuring the temperature of the cargo, if any, operate satisfactorily.

### **3.3 Fire-fighting systems in cargo area**

**3.3.1** The survey is to include:

- external examination of piping and cut-out valves of fixed fire-fighting systems related to cargo tanks and cargo pump rooms
- confirmation, as far as practicable and when appropriate, that the remote means for closing the various openings are operable
- examination of the appropriate portable fire-extinguishing equipment for the cargoes to be carried in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.3]
- examination of fire-fighting systems of any type fitted on board such as deck foam, water-spraying, etc., as applicable in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4].

### **3.4 Inert gas system**

**3.4.1** The survey is to include:

- external examination of the whole system, to check the condition of all piping, including vent piping above the upper deck in the cargo tank area and overboard discharges through the shell so far as practicable, and associated components to verify, in particular, the absence of signs of corrosion and leakage of gas, water or other liquid from inert gas and water piping systems or from the pressure/vacuum breaking device
- check of proper operation of both inert gas blowers
- check of proper operation of ventilation system required for scrubber room (if any)
- check of deck water seal for automatic water filling and draining
- check of absence of water carry over in the inert gas from the deck water seal and check of the condition of the non-return valve
- check of proper operation of all remotely operated or automatically controlled valves and, in particular, of the flue gas isolating valve located on the inert gas supply main after the blowers
- check of proper operation of the interlocking feature fitted to prevent soot blowers from operating when the inert gas system is working
- check that the gas pressure regulating valve automatically closes when gas blowers are stopped
- check, as far as practicable and using simulated conditions where necessary, of the following alarms and safety devices of the inert gas system:
  - high oxygen content of gas in the inert gas main
  - low gas pressure in the inert gas main
  - low pressure in the supply to the deck water seal
  - high temperature of gas in the inert gas main, including automatic shutdown devices
  - low water pressure to the scrubber, including automatic shutdown devices
  - accuracy of portable and fixed oxygen measuring equipment by means of calibration gases
  - high water level in the scrubber, including automatic shutdown devices
  - failure of the inert gas blowers
  - failure of the power supply to the automatic control system for the gas regulating valve and to the instrumentation for continuous indication and permanent recording of pressure and oxygen content in the inert gas main
  - high pressure of gas in the inert gas main
- check, when practicable, of the proper operation of the inert gas system on completion of the checks listed above.

## **4 Intermediate survey - Hull items**

### **4.1 General**

**4.1.1** The survey of weather decks is to include:

- examination, as far as applicable, of cargo, crude oil washing, bunker, ballast, steam and vent piping systems as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both. Particular attention is to be paid to repairs such as welded doublers
- confirmation, if applicable, that cargo pipes are electrically bonded to the hull
- examination of vent line drainage arrangements.

**4.1.2** For ships built under the Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out.

## **4.2 Ships between 5 and 10 years of age**

**4.2.1** For single hull oil tankers and combination carriers, all ballast tanks are to be examined.

When considered necessary by the Surveyor, thickness measurements and testing are to be carried out to ensure that the structural integrity remains effective.

**4.2.2** For double hull oil tankers, an overall survey of representative salt water ballast tanks selected by the Surveyor is to be carried out.

If such overall survey reveals no visible structural defects, the examination may be limited to a verification that the hard protective coating remains in good condition.

**4.2.3** A ballast tank is to be examined at subsequent annual surveys where:

- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than good condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurement is to be carried out as deemed necessary by the Surveyor.

**4.2.4** In addition to the requirements above, suspect areas identified at previous surveys are to be examined.

## **4.3 Ships between 10 and 15 years of age**

**4.3.1** The scope of intermediate survey of ships between 10 and 15 years of age is the scope of the preceding class renewal survey of hull, as detailed in [6] with bottom survey in dry condition or bottom in water survey as applicable. However, pressure testing of all cargo and ballast tanks and the requirements for longitudinal strength evaluation of hull girder as required in [6.5.5] are not required unless deemed necessary by the attending Surveyor.

## **4.4 Ships over 15 years of age**

**4.4.1** The scope of intermediate survey of ships over 15 years of age is the scope of the preceding class renewal survey of hull, as detailed in [6] with bottom survey in dry condition, except that pressure testing of ballast and cargo tanks and the requirements for longitudinal strength evaluation of hull girder as required in [6.5.5] is not required unless deemed necessary by the Surveyor. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and water ballast tanks are to be carried out during the bottom survey in accordance with the applicable requirements for intermediate surveys, if not already performed.

Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

The requirements of [6.8] are not applicable.

# **5 Intermediate survey - Cargo machinery items**

## **5.1 Cargo area and cargo pump rooms**

**5.1.1** A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment and fixtures, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

**5.1.2** The electrical insulation resistance of the electrical equipment and circuits terminating in or passing through the dangerous zones is to be tested; however, in cases where a proper record of testing is maintained, consideration may be given to accepting recent test readings effected by the ship's personnel.

**5.1.3** The satisfactory condition of the cargo heating system is to be verified.

## **5.2 Inert gas system**

**5.2.1** The following is to be carried out:

- main parts such as the scrubber, washing machines, blowers, deck water seal and non-return valve are to be opened out as considered necessary and examined
- gas distribution lines and shut-off valves, including soot blower interlocking devices, are to be examined as deemed necessary
- all automatic shutdown devices and alarms are to be examined and tested.

## **6 Class renewal survey - Hull items**

### **6.1 Survey programme and preparation for hull survey**

**6.1.1** The Owner in cooperation with the Society is to work out a specific Survey Programme prior to the commencement of any part of:

- the class renewal survey
- the intermediate survey for oil tankers over 10 years of age.

The survey programme is to be in a written format. The survey is not to commence until the Survey Programme has been agreed. Prior to the development of the Survey Programme, the survey planning questionnaire is to be completed by the Owner and forwarded to the Society.

The survey programme at intermediate survey may consist of the survey programme at the previous class renewal survey supplemented by the hull condition evaluation report of that class renewal survey and later relevant survey reports.

The survey programme is to be worked out taking into account any amendments to the survey requirements after the last class renewal survey carried out.

**6.1.2** In developing the survey programme, the following documentation is to be collected and consulted with a view to selecting tanks, areas and structural elements to be examined:

- a) survey status and basic ship information
- b) documentation on board, as described in [1.2.2] and [1.2.3]
- c) main structural plans of cargo and ballast tanks (scantlings drawings), including information regarding use of high-tensile steels (HTS)
- d) Hull Condition Evaluation Report
- e) relevant previous damage and repair history
- f) relevant previous survey and inspection reports from both the Society and the Owner
- g) cargo and ballast history for the last 3 years, including carriage of cargo under heated conditions
- h) details of the inert gas plant and tank cleaning procedures
- i) information and other relevant data regarding conversion or modification of the ship's cargo and ballast tanks since the time of construction
- j) description and history of the coating and corrosion protection system (including previous class notations), if any
- k) inspections by the Owner's personnel during the last 3 years with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the coating and corrosion protection system if any
- l) information regarding the relevant maintenance level during operation including port state control reports of inspection containing hull related deficiencies, Safety Management System non-conformities relating to hull maintenance, including the associated corrective action(s), and
- m) any other information that will help identify suspect areas and critical structural areas.

**6.1.3** The submitted survey programme is to account for and comply, as a minimum, with the requirements of Tab 1 or Tab 2, Tab 3 and Tab 6, for close-up survey, thickness measurements and tank testing, respectively, and is to include relevant information including at least:

- a) basic ship information and particulars
- b) main structural plans of cargo and ballast tanks (scantling drawings), including information regarding use of high tensile steels (HTS)
- c) arrangement of tanks
- d) list of tanks with information on their use, extent of coatings and corrosion protection systems
- e) conditions for survey (e.g., information regarding tank cleaning, gas freeing, ventilation, lighting, etc.)
- f) provisions and methods for access to structures
- g) equipment for surveys
- h) identification of tanks and areas for close-up survey (see [6.4])
- i) identification of areas and sections for thickness measurement (see [6.5])
- j) identification of tanks for tank testing (see [6.6])
- k) identification of the thickness measurement firm
- l) damage experience related to the ship in question, and
- m) critical structural areas and suspect areas, where relevant.

**6.1.4** The Society is to advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the ship.

## 6.2 Survey planning meeting

**6.2.1** The establishment of proper preparation and the close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board, safety meetings are to be held regularly.

**6.2.2** Prior to commencement of any part of the renewal and intermediate survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement firm operator (as applicable) and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out. See also [1.1.7].

**Table 1 : Close-up survey at class renewal survey of single hull oil tankers and combination carriers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
One web frame ring ①: - in a ballast wing tank, if any, or - in a cargo wing tank used primarily for water ballast	All web frame rings ①: - in a ballast wing tank, if any, or - in a cargo wing tank used primarily for water ballast	All web frame rings ① in all ballast tanks All web frame rings ① in a cargo wing tank A minimum of 30% (1) of all web frame rings ① in each remaining cargo wing tank	As class renewal survey for ships between 10 and 15 years of age Additional transverse areas as deemed necessary by the Society
One deck transverse ② in a cargo tank	One deck transverse ②: - in each remaining ballast tank, if any - in a cargo wing tank - in two cargo centre tanks		
	Both transverse bulkheads ③: - in a wing ballast tank, if any, or - in a cargo wing tank used primarily for water ballast	All transverse bulkheads (area ③) in all cargo and ballast tanks	
One transverse bulkhead ④ in a ballast tank One transverse bulkhead ④ in a cargo wing tank One transverse bulkhead ④ in a cargo centre tank	One transverse bulkhead ④ in each remaining ballast tank One transverse bulkhead ④ in a cargo wing tank One transverse bulkhead ④ in two cargo centre tanks		
		A minimum of 30% (1) of deck and bottom transverses ⑤ in each cargo centre tank	
		Additional web frame ring(s) ①, as considered necessary by the Surveyor	

(1) The 30% is to be rounded up to the next whole integer.

**Note 1:** See Fig 1 or Fig 2 for areas ①, ②, ③, ④ and ⑤.

- ① Complete transverse web frame ring including adjacent structural member.
- ② Deck transverse including adjacent deck structural members.
- ③ Transverse bulkhead complete, including girder system and adjacent structural members.
- ④ Transverse bulkhead lower part, including girder system and adjacent structural members.
- ⑤ Deck and bottom transverse, including adjacent structural members.

Figure 1 : Areas subject to close-up surveys and thickness measurements - Single hull oil tanker

Figure 2 : Areas subject to close-up surveys and thickness measurements - Combination carrier / OOC

6.2.3 The following is an indicative list of items that are to be addressed in the meeting:

- a) schedule of the ship (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.)
- b) provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety)
- c) extent of the thickness measurements
- d) acceptance criteria (refer to the list of minimum thicknesses)
- e) extent of close-up survey and thickness measurements considering the coating condition and suspect areas/areas of substantial corrosion
- f) execution of thickness measurements
- g) taking representative readings in general and where uneven corrosion/pitting is found
- h) mapping of areas of substantial corrosion, and
- i) communication between attending surveyor(s), the thickness measurement firm operator(s) and owner representative(s) concerning findings.

### 6.3 Scope of survey

6.3.1 In addition to the requirements of annual surveys, the class renewal survey is to include examination, tests and checks of sufficient extent to ensure that the hull and related piping are in satisfactory condition for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

**6.3.2** All cargo tanks, ballast tanks, including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in [6.5] and [6.6], to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

**6.3.3** As indicated in Ch 3, Sec 3, [2.1.1], a bottom survey in dry condition is to be a part of the class renewal survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks are to be carried out during this bottom survey in accordance with the applicable requirements for class renewal surveys, if not already performed.

Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

**6.3.4** Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined.

A ballast tank is to be examined at subsequent annual surveys where:

- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than good condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurement is to be carried out as deemed necessary by the Surveyor.

## **6.4 Overall and close-up surveys**

**6.4.1** Each class renewal survey is to include an overall survey of all tanks and spaces.

**6.4.2** The minimum requirements for close-up surveys are given in Tab 1 for single hull oil tankers and combination carriers or Tab 2 for double hull oil tankers.

**6.4.3** The Surveyor may extend the close-up survey as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

- where tanks have structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information
- where tanks have structures approved with reduced scantlings.

**6.4.4** For areas in tanks where hard protective coatings are found to be in good condition, as defined in Ch 2, Sec 2, [2.2.14], the extent of close-up surveys required according to Tab 1 or Tab 2 may be specially considered.

## **6.5 Thickness measurements**

**6.5.1** The minimum requirements for thickness measurements at class renewal survey are given in Tab 3.

**6.5.2** Provisions for extended measurements for areas with substantial corrosion are given in Tab 4 for single hull oil tankers and combination carriers or Tab 5 for double hull oil tankers and as may be additionally specified in the survey program as required in [6.1]. These extended thickness measurements are to be carried out before the survey is credited as completed.

Suspect areas identified at previous surveys are to be examined.

Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

The Surveyor may further extend the thickness measurements as deemed necessary.

Note 1: For ships built under the Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out at annual and intermediate surveys.

**6.5.3** When pitting is found on bottom plating and its intensity is 20% or more, thickness measurements are to be extended in order to determine the actual plate thickness out of the pits and the depth of the pits. Where the wastage is in the substantial corrosion range or the average depth of pitting is 1/3 or more of the actual plate thickness, the pitted plate is to be considered as a substantially corroded area.

**6.5.4** For areas in tanks where hard protective coatings are found to be in good condition as defined in Ch 2, Sec 2, [2.2.14], the extent of thickness measurements according to Tab 3 may be specially considered.

**6.5.5** On oil tankers of 130 m in length and upwards (as defined in the International Convention on Load Lines in force) and more than 10 years of age, the longitudinal strength of the ship's hull girder is to be evaluated in compliance with the requirements of Ch 4, App 1 on the basis of the thickness of the structures measured, renewed or reinforced, as appropriate, during the class renewal survey.

**Table 2 : Close-up survey at class renewal survey of double hull oil tankers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15

	Selected wind and water strakes outside the cargo area	Selected wind and water strakes outside the cargo area	All wind and water strakes, full length
(1) For combination carriers only the deck plating outside line of cargo hold hatch openings is to be measured. (2) Transverse sections are to be chosen where the largest reductions are likely to occur or as revealed by deck plating measurements. (3) At least one section is to be within 0,5 L amidships and, where applicable, in way of a ballast tank. (4) Not applicable to double hull oil tankers.			

**Table 4 : Extended thickness measurements at those areas of substantial corrosion  
Single hull oil tankers and combination carriers**

<b>BOTTOM STRUCTURE</b>		
Structural member	Extent of measurement	Pattern of measurement
Bottom plating	Minimum of 3 bays across tank, including aft bay Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and webs
Bottom longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertical web
Bottom girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across face flat. 5-point pattern on girder/bulkhead brackets.
Bottom transverse webs	3 webs in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over 2 square metre area. Single measurements on face flat.
Panel stiffening	Where provided	Single measurements
<b>DECK STRUCTURE</b>		
Structural member	Extent of measurement	Pattern of measurement
Deck plating	2 bands across tank	Minimum of 3 measurements per plate per band
Deck longitudinals	Minimum of 3 longitudinals in each of 2 bays	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across face flat. 5-point pattern on girder/bulkhead brackets.
Deck transverse webs	Minimum of 2 webs, with measurements at both ends and middle of span	5-point pattern over 2 square metre area. Single measurements on face flat.
Panel stiffening	Where provided	Single measurements
<b>SIDE SHELL AND LONGITUDINAL BULKHEADS</b>		
Structural member	Extent of measurement	Pattern of measurement
Deckhead and bottom strakes and strakes in way of stringer platforms	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
All other strakes	Plating between every third pair of longitudinals in same 3 bays	Single measurement
Longitudinals on deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
All other longitudinals	Every third longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
Longitudinal brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5-point pattern over area of bracket
Web frames and cross ties	3 webs with minimum of 3 locations on each web, including in way of cross tie connections	5-point pattern over approximately 2 square metre area, plus single measurements on web frame and cross tie face flats

<b>TRANSVERSE BULKHEADS AND SWASH BULKHEADS</b>		
Structural member	Extent of measurement	Pattern of measurement
Deckhead and bottom strakes, and strakes in way of stringer platforms	Plating between pair of stiffeners at 3 locations: approximately 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over 1 metre length
All other strakes	Plating between pair of stiffeners at middle location	Single measurement
Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5-point pattern over about 1 square metre of plating
Stiffeners	Minimum of 3 typical stiffeners	For web, 5-point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
Brackets	Minimum of 3 at top, middle and bottom of tank	5-point pattern over area of bracket
Deep webs and girders	Measurements at toe of bracket and at centre of span	For web, 5-point pattern over about 1 square metre 3 measurements across face flat
Stringer platforms	All stringers with measurements at both ends and middle	5-point pattern over 1 square metre of area plus single measurements near bracket toes and on face flats

**Table 5 : Extended thickness measurements at those areas of substantial corrosion  
Double hull oil tankers**

<b>BOTTOM, INNER BOTTOM AND HOPPER STRUCTURE</b>		
Structural member	Extent of measurement	Pattern of measurement
Bottom, inner bottom and hopper structure plating	Minimum of 3 bays across double bottom tank, including aft bay Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
Bottom, inner bottom and hopper structure longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of 3 measurements
Bottom floors, including the watertight ones	3 floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over 2 square metre area
Hopper structure web frame ring	3 floors in bays where bottom plating measured	5-point pattern over about 1 square metre of plating. Single measurements on flange.
Hopper structure transverse watertight bulkhead or swash bulkhead	• lower 1/3 of bulkhead	5-point pattern over about 1 square metre of plating
	• upper 2/3 of bulkhead	5-point pattern over 2 square metre of plating
	• stiffeners (minimum of 3)	For web, 5-point pattern over span (2 measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span.
Panel stiffening	Where provided	Single measurements
<b>DECK STRUCTURE</b>		
Structural member	Extent of measurement	Pattern of measurement
Deck plating	2 transverse bands across tank	Minimum of 3 measurements per plate per band
Deck longitudinals	Every third longitudinal in each of 2 bands with a minimum of one longitudinal	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)

Deck girders and brackets (usually in cargo tanks only)	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across flange. 5-point pattern on girder/bulkhead brackets.
Deck transverse webs	Minimum of 2 webs, with measurements at both ends and middle of span	5-point pattern over 1 square metre area. Single measurements on flange.
Vertical web and transverse bulkhead in wing ballast tank (2 metres from deck)	Minimum of 2 webs, and both transverse bulkheads	5-point pattern over 1 square metre area
Panel stiffening	Where provided	Single measurements
<b>STRUCTURE IN WING BALLAST TANKS</b>		
Structural member	Extent of measurement	Pattern of measurement
Side shell and longitudinal bulkhead plating:		
<ul style="list-style-type: none"> <li>upper strake and strakes in way of horizontal girders</li> <li>all other strakes</li> </ul>	Plating between each pair of longitudinals in a minimum of 3 bays (along the tank)	Single measurement
	Plating between every third pair of longitudinals in same 3 bays	Single measurement
Side shell and longitudinal bulkhead longitudinals on:		
<ul style="list-style-type: none"> <li>upper strake</li> <li>all other strakes</li> </ul>	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
	Every third longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
Longitudinal brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5-point pattern over area of bracket
Vertical web and transverse bulkheads (excluding deckhead area):		
<ul style="list-style-type: none"> <li>strakes in way of horizontal girders</li> <li>other strakes</li> </ul>	Minimum of 2 webs and both transverse bulkheads	5-point pattern over 2 square metre area
	Minimum of 2 webs and both transverse bulkheads	2 measurements between each pair of vertical stiffeners
Horizontal girders	Plating on each girder in a minimum of 3 bays	2 measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where provided	Single measurements
<b>LONGITUDINAL BULKHEADS IN CARGO TANKS</b>		
Structural member	Extent of measurement	Pattern of measurement
Deckhead and bottom strakes and strakes in way of the horizontal stringers of transverse bulkheads	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
All other strakes	Plating between every third pair of longitudinals in same 3 bays	Single measurement
Longitudinals on deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
All other longitudinals	Every third longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
Longitudinal brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5-point pattern over area of bracket
Web frames and cross ties	3 webs with minimum of 3 locations on each web, including in way of cross tie connections	5-point pattern over approximately 2 square metre area of webs, plus single measurements on flanges of web frame and cross ties
Lower end brackets (opposite side of web frame)	Minimum of 3 brackets	5-point pattern over approximately 2 square metre area of brackets, plus single measurements on bracket flanges

TRANSVERSE WATERTIGHT AND SWASH BULKHEADS IN CARGO TANKS		
Structural member	Extent of measurement	Pattern of measurement
Upper and lower stool, where fitted	<ul style="list-style-type: none"> <li>Transverse band within 25mm of welded connection to inner bottom/deck plating</li> <li>Transverse band within 25mm of welded connection to shelf plate</li> </ul>	5-point pattern between stiffeners over 1 metre length
Deckhead and bottom strakes, and strakes in way of horizontal stringers	Plating between pair of stiffeners at 3 locations: approximately 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over 1 metre length
All other strakes	Plating between pair of stiffeners at middle location	Single measurement
Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5-point pattern over about 1 square metre of plating
Stiffeners	Minimum of 3 typical stiffeners	For web, 5-point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
Brackets	Minimum of 3 at top, middle and bottom of tank	5-point pattern over area of bracket
Horizontal stringers	All stringers with measurements at both ends and middle	5-point pattern over 1 square metre of area plus single measurements near bracket toes and on flange

**Table 6 : Tank testing at class renewal survey of oil tankers and combination carriers**

Age of ship (in years at time of class renewal survey)	
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 and subsequent age > 5
All ballast tank boundaries	All ballast tank boundaries
Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	All cargo tank bulkheads

## 6.6 Tank testing

**6.6.1** The requirements for tank testing at class renewal survey are given in Tab 6.

**6.6.2** Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor, provided the following conditions are complied with:

- a tank testing procedure, specifying fill heights, tanks being filled and bulkheads being tested, has been submitted by the Owner and reviewed by the Society prior to the testing being carried out
- there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank
- the tank testing has been satisfactorily carried out, within the class renewal survey window, not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed
- the satisfactory results of the testing is recorded in the ship's logbook
- the internal and external conditions of the tanks and associated structures are found satisfactory by the Surveyor at the time of the overall and close-up surveys.

**6.6.3** The Surveyor may extend the tank testing as deemed necessary.

**6.6.4** Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.

Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions

For double hull oil tankers, the testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tanktop is carried out.

## 6.7 Cargo piping, area and pump rooms

**6.7.1** Cargo and crude oil washing piping on deck and cargo and ballast piping systems within the cargo area are to be examined and operationally tested to working pressure to the attending Surveyor's satisfaction to ensure that their tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void

spaces. Surveyors are to be advised on all occasions when this piping, including valves and fittings, is opened during repair periods and can be examined internally.

The surveyor may require dismantling and/or thickness measurements of piping. A hydraulic test is to be carried out in the event of repair or dismantling of cargo, crude oil washing, or ballast piping, or where doubts arise.

**6.7.2** All safety valves on cargo piping and of cargo tanks are to be dismantled for examination, adjusted and, as applicable, resealed.

**6.7.3** All cargo pump room boundaries are to be generally examined. All gas-tight shaft sealing devices are to be examined. The bottom of cargo pump rooms is to be presented clean for the examination of stripping devices and gutters.

## **6.8 Emergency towing arrangement**

**6.8.1** The survey is to include:

- an examination of the emergency towing arrangement
- confirmation that the arrangement is readily available with aft towing arrangement pre-rigged and forward chafing gear secured to the strong-point
- an examination of the pick-up gear, towing pennant and chafing gear over the full length for possible deterioration. Where the pennant line is stored in a watertight condition and can be confirmed as being maintained, consideration may be given to waiving the requirement to examine the pennant line over the full length
- an examination of the strong-points, fairleads and pedestal roller together with their attachments to the hull structure.

## **7 Class renewal survey - Cargo machinery items**

### **7.1 Cargo area and cargo pump rooms**

**7.1.1** Ballast and stripping pumps are to be internally examined and prime movers checked. A working test is to be carried out, as far as practicable.

Maintenance records of cargo pumps are to be made available to the Surveyor.

**7.1.2** Where a crude oil washing system is fitted, piping, pumps, valves and deck-mounted washing machines are to be examined and tested for signs of leakage, and anchoring devices of deck-mounted washing machines are to be checked to the Surveyor's satisfaction.

**7.1.3** The satisfactory condition of the cargo heating system is to be verified and, if deemed necessary by the Surveyor, the system is to be pressure tested.

**7.1.4** An operating test of the remote control of pumps and valves and of automatic closing valves is to be carried out.

**7.1.5** A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment and fixtures, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

The electrical insulation resistance of the electrical equipment and circuits terminating in or passing through the dangerous zones is to be tested; however, in cases where a proper record of testing is maintained, consideration may be given to accepting recent test readings effected by the ship's personnel.

### **7.2 Fire-fighting systems in cargo area**

**7.2.1** The survey is to include the examination of fire-fighting systems of any type fitted on board for the protection of the cargo area, cargo pump room and other dangerous spaces, such as deck foam, water-spraying systems, etc., as applicable in accordance with the relevant requirements given in Ch 3, Sec 3, [3.8].

### **7.3 Inert gas system**

**7.3.1** In addition to the inspections required at the intermediate survey, the following is to be carried out:

- a) an internal examination of:
  - the inert gas generator, where fitted
  - the scrubber
  - the deck water seal including the non-return valve
  - the pressure/vacuum breaking device
  - the cooling water systems including overboard discharge from the scrubber
  - all valves
- b) a test to verify the proper operation of the system upon completion of all survey checks.

# Section 4 Chemical Tankers

## 1 General

### 1.1 Application

**1.1.1** The requirements of this Section apply to all self-propelled ships which have been assigned the service notation **chemical tanker ESP**. If such a ship is constructed with both integral and independent tanks, these requirements are applicable only to that portion of the cargo length containing integral tanks. Combined gas carriers/chemical tankers with independent tanks within the hull are to be surveyed as gas carriers.

**1.1.2** The requirements apply to the surveys of the hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels and void spaces within the cargo area and all ballast tanks. These requirements, however, do not apply to independent tanks on deck. They are additional to the requirements applicable to the remainder of the ship, given in Part A, Chapter 3 according to the relevant surveys.

**1.1.3** The requirements contain the minimum extent of examination, thickness measurements and tank testing. When substantial corrosion and/or structural defects are found, the survey is to be extended and is to include additional close-up surveys when necessary.

**1.1.4** In any kind of survey, i.e. class renewal, intermediate, annual or other surveys having the same scope, thickness measurements, when required by Tab 3, of structures in areas where close-up surveys are required are to be carried out simultaneously with close-up surveys.

**1.1.5** Consideration may be given by the attending Surveyor to allow use of Remote Inspection Techniques (RIT) as an alternative to close-up survey, as defined in Ch 2, Sec 2. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor.

**1.1.6** In all cases the extent of the thickness measurements are to be sufficient as to represent the actual average condition.

**1.1.7** When, in any survey, thickness measurements are required:

- the procedure detailed in Ch 2, Sec 2, [2.3] is to be applied
- the thickness measurement firm is to be part of the survey planning meeting to be held prior to commencing the survey.

**1.1.8** The requirements for machinery surveys apply to surveys of the machinery and equipment in the cargo area or dedicated to cargo service systems and are additional to those given in Part A, Chapter 3 for all ships.

### 1.2 Documentation on board

**1.2.1** The Owner is to obtain, supply and maintain documentation on board as specified in [1.2.2] and [1.2.3], which is to be readily available for examination by the Surveyor. The documentation is to be kept on board for the lifetime of the ship.

**1.2.2** A survey report file is to be a part of the documentation on board consisting of:

- reports of structural surveys
- hull condition evaluation report (summarising the results of class renewal surveys)
- thickness measurement reports.

The survey report file is also to be available in the Owner's management office.

**1.2.3** The following additional supporting documentation is to be available on board:

- survey program, as required in [6.1], until such time as the class renewal survey or intermediate survey, as applicable, has been completed
- main structural plans of cargo and ballast tanks
- previous repair history
- cargo and ballast history
- extent of use of inert gas system and tank cleaning procedures
- ship's personnel reports on:
  - structural deterioration/defects in general
  - leakage in bulkheads and piping systems
  - condition of coatings or corrosion prevention systems, if any
- any other information that may help identify critical structural areas and/or suspect areas requiring inspection.

**1.2.4** Prior to survey, the Surveyor examines the documentation on board and its contents, which are used as a basis for the survey.

### **1.3 Reporting and evaluation of surveys**

**1.3.1** The data and information on the structural condition of the ship collected during survey are evaluated for acceptability and structural integrity of the ship's cargo area.

**1.3.2** A hull condition evaluation report (summarising the results of class renewal surveys) is issued by the Society to the Owner, who is to place it on board the ship for reference at future surveys. The hull condition evaluation report is endorsed by the Society.

**1.3.3** When a survey is split between different survey stations, a report is to be made for each portion of the survey. A list of items examined and/or tested (pressure testing, thickness measurements, etc.) and an indication of whether the item has been credited, are to be made available to the next attending Surveyor(s), prior to continuing or completing the survey.

### **1.4 Conditions for survey**

**1.4.1** In order to enable the attending surveyors to carry out the survey, provisions for proper and safe access are to be agreed between the Owner and the Society.

Details of the means of access are to be provided in the survey planning questionnaire.

In cases where the provisions of safety and required access are judged by the attending surveyors not to be adequate, the survey of the spaces involved is to not proceed.

### **1.5 Access to structures**

**1.5.1** For overall survey, means are to be provided to enable the surveyor to examine the hull structure in a safe and practical way.

**1.5.2** For close-up survey, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

- permanent staging and passages through structures
- temporary staging and passages through structures
- hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
- boats or rafts
- portable ladders
- other equivalent means.

**1.5.3** For surveys conducted by use of remote inspection technique, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

- unmanned robot arm
- remote operated vehicle (ROV)
- unmanned aerial vehicles/drones
- other means acceptable to the Society.

## **2 Annual survey - Hull items**

### **2.1 General**

**2.1.1** The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file.

### **2.2 Weather decks**

**2.2.1** The survey is to include:

- examination of cargo tank openings, including gaskets, covers, coamings and flame screens
- examination of cargo tank vent system, including the pressure/vacuum valves and secondary means to prevent over- or under-pressure and devices to prevent the passage of flames
- examination of flame screens on vents to all bunker tanks
- examination of cargo, bunker, ballast and vent piping systems, including remote control valves, safety valves and various safety devices, as well as vent masts and headers
- confirmation that wheelhouse doors and windows, sidescuttles and windows in superstructure and deckhouse ends facing the cargo area are in satisfactory condition
- confirmation that pumps, valves and pipelines are identified and distinctively marked.

- examination of watertight penetrations as far as practicable.

### **2.3 Cargo pump rooms and pipe tunnels**

**2.3.1** The survey is to include:

- examination of all pump room bulkheads and pipe tunnels (if any) for signs of chemical cargo leakage or fractures and, in particular, the sealing arrangements of penetrations in pump room bulkheads
- examination of the condition of all piping systems, in cargo pump rooms and pipe tunnels (if any)
- examination of the bilge and ballast arrangements and confirmation that pumps and pipelines are identified.

### **2.4 Ballast tanks**

**2.4.1** Ballast tanks are to be internally examined when required as a consequence of the results of the class renewal survey or the intermediate survey; see [6.3.4] and [4.2.2], respectively.

**2.4.2** When considered necessary by the Surveyor or when extensive corrosion exists, thickness measurements are to be carried out and if the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with Tab 4. These extended thickness measurements are to be carried out before the survey is credited as completed.

Suspect areas identified at previous surveys are to be examined.

Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

### **2.5 Emergency towing arrangement**

**2.5.1** The Owner or his representative is to declare to the attending Surveyor that no significant alterations have been made, without prior approval from the Society, to the equipment and arrangements fitted on board in accordance with the provisions given in Pt B, Ch 12, Sec 4, [3].

**2.5.2** The survey is to include:

- an examination, as far as practicable, of the emergency towing arrangement
- confirmation that the aft towing arrangement is prerigged and forward chafing gear is secured to the strong-point
- confirmation of the proper functioning of the light, where it is provided, on the pick-up gear marker buoy.

## **3 Annual survey - Cargo machinery items**

### **3.1 Cargo area and cargo pump rooms**

**3.1.1** The Owner or his representative is to declare to the attending Surveyor that no modifications or alterations which might impair safety have been made to the various installations in dangerous zones without prior approval from the Society.

The survey is to include:

- confirmation that potential sources of ignition in or near the cargo pump rooms, such as loose gear, excessive product in bilge, excessive vapours, combustible materials, etc., are eliminated and that access ladders are in satisfactory condition
- examination, as far as practicable, of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of the pump room bilge system, and checking that pump foundations are intact
- confirmation that the ventilation system, including portable equipment, if any, of all spaces in the cargo area (including cargo pump rooms) is operational, ducting is intact, dampers are operational and screens are clean
- confirmation that electrical equipment in dangerous zones, cargo pump rooms and other spaces is in satisfactory condition and has been properly maintained
- confirmation that the remote operation of the cargo pump room bilge system is satisfactory
- confirmation that cargo pump room rescue arrangements are in order
- confirmation that removable pipe lengths or other approved equipment necessary for cargo separation are available and in satisfactory condition
- examination of the cargo heating/cooling system and sampling arrangements where required
- examination of the cargo-transfer arrangement and confirmation that the ship's cargo hoses are suitable for their intended purpose and in satisfactory condition and, where appropriate, type approved or marked with date of testing
- confirmation that any special arrangement made for bow or stern loading/unloading is in satisfactory condition and test of the means of communications and the remote shutdown for the cargo pumps
- confirmation that, if applicable, the provisions made for chemical products which have special requirements as per Pt D, Ch 8, Sec 15 are satisfactory.

### **3.2 Instrumentation and safety devices**

**3.2.1** The survey is to include the following items, as far as required or fitted:

- confirmation that installed pressure gauges on cargo discharge lines are properly operational
- examination of gauging devices, high level alarms and valves associated with overflow control
- confirmation that devices provided for measuring the temperature of the cargo and associated alarms operate satisfactorily
- confirmation that the required gas detection instruments are on board and satisfactory arrangements have been made for the supply of any required vapour detection tubes.

### **3.3 Fire-fighting systems in cargo area**

**3.3.1** The survey is to include:

- external examination of piping and cut-out valves of fixed fire-fighting systems related to cargo tanks and cargo pump rooms
- confirmation, as far as practicable and when appropriate, that the remote means for closing the various openings are operable
- examination of the appropriate portable fire-extinguishing equipment for the chemical cargoes to be carried in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.3]
- examination of fire-fighting systems of any type fitted on board such as deck foam, water-spraying, etc. as applicable in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.2].

### **3.4 Inert gas system and inert/padding/ drying gas**

**3.4.1** If an inert gas system such as that installed on board oil tankers is fitted, the requirements given in Ch 4, Sec 3, [3.4] are to be complied with.

**3.4.2** If an inert gas system consisting of a gas container package is fitted, arrangements are to be made for sufficient inert or padding gas to be carried to compensate for normal losses and means are to be provided for monitoring of ullage spaces.

**3.4.3** If drying gas is necessary to supply the cargo spaces, arrangements are to be made for sufficient drying gas to be carried to compensate for normal losses and means are to be provided for monitoring of ullage spaces.

**3.4.4** When drying agents are used on air inlets to cargo tanks, it is to be verified that arrangements are made for sufficient medium to be carried.

## **4 Intermediate survey - Hull items**

### **4.1 General**

**4.1.1** For weather decks, an examination as far as applicable of cargo, bunker, ballast, steam and vent piping systems as well as vent masts and headers is to be carried out. If upon examination, there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both.

The survey is also to include:

- confirmation that the pipelines and independent cargo tanks where applicable, are electrically bonded to the hull
- examination of vent line drainage arrangements.

### **4.2 Ships between 5 and 10 years of age**

**4.2.1** For ballast tanks, an overall survey of representative tanks selected by the Surveyor is to be carried out. If such inspection reveals no visible structural defects, the examination may be limited to a verification that the hard protective coating remains in good condition.

**4.2.2** A ballast tank is to be examined at subsequent annual surveys where:

- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than good condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

**4.2.3** In addition to the requirements above, suspect areas identified at previous surveys are to be examined.

### **4.3 Ships between 10 and 15 years of age**

**4.3.1** The scope of intermediate survey of ships between 10 and 15 years of age is the scope of the preceding class renewal survey of hull, as detailed in Article [6] with bottom survey in dry condition or bottom in water survey as applicable. However, pressure testing of all cargo and ballast tanks are not required unless deemed necessary by the attending Surveyor.

## **4.4 Ships over 15 years of age**

**4.4.1** The scope of intermediate survey of ships over 15 years of age is the scope of the preceding class renewal survey of hull, as detailed in [6] with bottom survey in dry condition, except that pressure testing of ballast and cargo tanks as detailed in [6.6] is not required unless deemed necessary by the Surveyor.

The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and water ballast tanks are to be carried out during the bottom survey in accordance with the applicable requirements for intermediate surveys, if not already performed.

Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

The requirements of [6.8] are not applicable.

## **5 Intermediate survey - Cargo machinery items**

### **5.1 Cargo area and cargo pump rooms**

**5.1.1** A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

**5.1.2** The electrical insulation resistance of the electrical equipment and circuits terminating in or passing through the dangerous zones is to be tested; however, in cases where a proper record of testing is maintained, consideration may be given to accepting recent test readings effected by the ship's personnel.

**5.1.3** The satisfactory condition of the cargo heating/cooling system is to be verified.

**5.1.4** The spares for cargo area mechanical ventilation fans are to be available on board.

### **5.2 Inert gas system**

**5.2.1** If an inert gas system such as that installed on board oil tankers is fitted, the requirements given in Ch 4, Sec 3, [5.2] for intermediate survey of oil tankers are to be complied with.

**5.2.2** For ships fitted with another type of inert gas producing system, the main parts such as the inert gas generator, deck water seal or equivalent back flow arrangement, segregation devices, as fitted are to be overhauled for examination and alarms are to be tested.

Inert gas producer isolating valves, when fitted, are to be dismantled for examination.

### **5.3 Personnel protection**

**5.3.1** The survey is to include:

- confirmation that the protective clothing for crew engaged in loading and discharging operations and its stowage is in satisfactory condition
- confirmation that the required safety equipment and associated breathing apparatus and associated air supplies and, when appropriate, emergency escape respiratory and eye protection are in a satisfactory condition and properly stowed
- confirmation that the medical first-aid equipment, including stretchers and oxygen resuscitation equipment are in a satisfactory condition
- confirmation that arrangements have been made for the antidotes for the cargoes actually carried to be on board
- confirmation that decontamination arrangements and eyewashes are operational
- confirmation that the required gas detection instruments are on board and that arrangements have been made for the supply of the appropriate vapour detection tubes
- confirmation that the arrangements for the stowage of cargo samples are satisfactory.

## **6 Class renewal survey - Hull items**

### **6.1 Survey program and preparation for survey**

**6.1.1** The Owner in cooperation with Society is to work out a specific Survey Programme prior to the commencement of any part of:

- the class renewal survey
- the intermediate survey for chemical tankers over 10 years of age.

The survey programme is to be in a written format.

Prior to the development of the survey programme, the survey planning questionnaire is to be completed by the Owner, and forwarded to the Society.

The survey programme at intermediate survey may consist of the survey programme at the previous class renewal survey supplemented by the hull condition evaluation report of that class renewal survey and later relevant survey reports. The survey program is to be worked out taking into account any amendments to the survey requirements after the last class renewal survey carried out.

**6.1.2** In developing the Survey Programme, the following documentation is to be collected and consulted with a view to selecting tanks, areas, and structural elements to be examined:

- a) survey status and basic ship information
- b) documentation on board, as described in [1.2.2] and [1.2.3]
- c) main structural plans of cargo and ballast tanks (scantling drawings), including information on use of high tensile steels (HTS), clad steel and stainless steel
- d) hull condition evaluation report
- e) relevant previous damage and repair history
- f) relevant previous survey and inspection reports from both the Society and the Owner
- g) information regarding the use of the ship's tanks, typical cargoes and other relevant data
- h) details of the inert gas plant and tank cleaning procedures
- i) information and other relevant data regarding conversion or modification of the ship's cargo and ballast tanks since the time of construction
- j) description and history of the coating and the corrosion prevention system (previous class notations), if any
- k) inspections by the Owner's personnel during the last three years with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the coating and corrosion prevention system, if any
- l) information regarding the relevant maintenance level during operation including port state control reports of inspection containing hull related deficiencies, Safety Management System non-conformities relating to hull maintenance, including the associated corrective action(s); and
- m) any other information that will help identify suspect areas and critical structural areas.

**6.1.3** The submitted Survey Programme is to account for and comply, as a minimum, with the requirements for close-up surveys, thickness measurements, tank testing and pipe testing given in Tab 1, Tab 2, Tab 3, [6.6] and [6.7.3], respectively and is to include relevant information including at least:

- a) basic ship information and particulars
- b) main structural plans (scantling drawings), including information on the use of high tensile steels (HTS), clad steel and stainless steel
- c) plan of tanks
- d) list of tanks with information on their use, corrosion prevention and condition of coating
- e) conditions for survey (e.g., information regarding tank cleaning, gas freeing, ventilation, lighting, etc.)
- f) provisions and methods for access to structures
- g) equipment for surveys
- h) nomination of tanks and areas for close-up surveys according to [6.4]
- i) nomination of sections and areas for thickness measurements according to [6.5]
- j) nomination of tanks for tank testing according to [6.6], and the pipes that are to undergo pipe testing according to [6.7.3]
- k) identification of the thickness measurement firm
- l) damage experience related to the ship in question
- m) critical structural areas and suspect areas, where relevant.

**6.1.4** The survey program is also to include the maximum acceptable structural corrosion diminution levels applicable to the ship. The Society will advise the Owner of this information.

## **6.2 Survey planning meeting**

**6.2.1** Proper preparation and close co-operation between the attending surveyor(s) and the Owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

**6.2.2** Prior to commencement of any part of the renewal and intermediate survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement firm representative, where involved, and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out. See also Ch 2, Sec 2, [2.3.2].

**Table 1 : Requirements for close-up survey at class renewal survey of single skin chemical tankers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
One web frame ring ①: - in a ballast wing tank	All web frame rings ①: - in a ballast wing tank, or - in a double bottom ballast tank (1)	All web frame rings ①: - in all ballast tanks - in a cargo wing tank One web frame ring ①: - in each remaining cargo tank	As class renewal survey for ships between 10 and 15 years of age  Additional transverse areas as deemed necessary by the Society
One deck transverse ②: - in a cargo tank or on deck	One deck transverse ②: - in each remaining ballast tank or on deck - in a cargo wing tank or on deck - in two cargo centre tanks or on deck		
	Both transverse bulkheads ③: - in a ballast wing tank	All transverse bulkheads ③: - in all cargo tanks - in all ballast tanks	
Lower part of one transverse bulkhead ④: - in a ballast tank - in a cargo wing tank - in a cargo centre tank (2)	Lower part of one transverse bulkhead ④: - in each remaining ballast tank - in two cargo centre tanks (2) - in a cargo wing tank		
<p>(1) Ballast double hull tank means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.</p> <p>(2) Where no centre cargo tanks are fitted (as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.</p> <p><b>Note 1:</b> ①, ②, ③ and ④ are areas to be subjected to close-up surveys and thickness measurements (see Fig 1 and Fig 2):</p> <p>① Complete transverse web frame ring, including adjacent structural members.</p> <p>② Deck transverse, including adjacent deck structural members.</p> <p>③ Transverse bulkhead complete, including girder system and adjacent structural members.</p> <p>④ Transverse bulkhead lower part, including girder system and adjacent structural members.</p>

 Midship section of chemical tanker (about 10 000DWT)

**Table 2 : Requirements for close-up survey at class renewal survey of double skin chemical tankers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
One web frame ring ①: - in a ballast double hull tank (1)	All web frame rings ①: - in a ballast wing tank, or - in a ballast double hull tank (1) The knuckle area and the upper part (3 metres approximately) of one web frame in each remaining ballast tank ⑥	All web frame rings: - in all ballast tanks ① - in a cargo wing tank ⑦ One web frame ring: - in each remaining cargo tank ⑦	As class renewal survey for ships between 10 and 15 years of age  Additional transverse areas as deemed necessary by the Society
One deck transverse ②: - in a cargo tank or on deck	One deck transverse ②: - in two cargo tanks		
One transverse bulkhead ④: - in a ballast tank (1)	One transverse bulkhead ④: - in each ballast tank (1)	All transverse bulkheads: - in all cargo tanks ③ - in all ballast tanks ④	
One transverse bulkhead ⑤: - in a cargo wing tank - in a cargo centre tank (2)	One transverse bulkhead ⑤: - in a cargo wing tank - in two cargo centre tanks (2)		
<p>(1) Ballast double hull tank means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.</p> <p>(2) Where no centre cargo tanks are fitted (as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.</p> <p><b>Note 1:</b> ①, ②, ③, ④, ⑤, ⑥ and ⑦ are areas to be subjected to close-up surveys and thickness measurements (see Fig 1, Fig 2 and Fig 3).</p> <p>① Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak tanks web frame means a complete transverse web frame ring including adjacent structural members.</p> <p>② Deck transverse including adjacent deck structural members (or external structure on deck in way of the tank, where applicable).</p> <p>③ Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.</p> <p>④ Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.</p> <p>⑤ Transverse bulkhead lower part in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted.</p> <p>⑥ The knuckle area and the upper part (3 metres approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, up to 2 metres from the corners both on the bulkhead and the double bottom.</p> <p>⑦ Web frame in a cargo tank means deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, including adjacent structural members.</p>			

**6.2.3** The following is an indicative list of items that are to be addressed in the meeting:

- schedule of the ship (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations etc.)
- provisions and arrangements for thickness measurements (i.e. access, cleaning/descaling, illumination, ventilation, personal safety)
- extent of the thickness measurements
- acceptance criteria (refer to the list of minimum thicknesses)
- extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion
- execution of thickness measurements
- taking representative readings in general and where uneven corrosion/pitting is found
- mapping of areas of substantial corrosion; and
- communication between attending surveyor(s), the thickness measurement firm operator(s) and owner representative(s) concerning findings.

### **6.3 Scope of survey**

**6.3.1** In addition to the requirements of annual surveys, the class renewal survey is to include examination, tests and checks of sufficient extent to ensure that the hull and related piping are in satisfactory condition for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

**6.3.2** All cargo tanks, ballast tanks, including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in [6.5] and [6.6] to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration that may be present.

**6.3.3** As indicated in Ch 3, Sec 3, [2.1.1], a bottom survey in dry condition is to be a part of the class renewal survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks are to be carried out during this bottom survey in accordance with the applicable requirements for class renewal surveys, if not already performed.

Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.

**6.3.4** Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined. A ballast tank is to be examined at subsequent annual surveys where:

- a hard protective coating has not been applied from the time of construction, or
- a soft or semi-hard coating has been applied, or
- substantial corrosion is found within the tank, or
- the hard protective coating is found to be in less than good condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurements are to be carried out as considered necessary by the Surveyor.

**6.3.5** In the case of independent cargo tanks, the survey consists of:

- an external examination of cargo tanks
- an examination of cargo tank supports, chocks, keys and the adjacent hull structure with non-destructive testing if deemed necessary.

**6.3.6** The Owner or his representative is to declare to the attending Surveyor that the arrangements in cargo tanks (including coating) related to the transported products are suitable for the purpose.

### **6.4 Overall and close-up surveys**

**6.4.1** Each class renewal survey is to include an overall survey of all tanks and all spaces.

**6.4.2** The minimum requirements for close-up surveys are given in Tab 1 and Tab 2.

**6.4.3** The survey of stainless steel tanks may be carried out as an overall survey supplemented by close-up survey as deemed necessary by the Surveyor.

**6.4.4** The Surveyor may extend the close-up survey as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

- where tanks have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information
- where tanks have structures approved with reduced scantlings.

**6.4.5** For areas in tanks where hard protective coatings are found to be in good condition, as defined in Ch 2, Sec 2, [2.2.14], the extent of close-up surveys required according to Tab 1 and Tab 2 may be specially considered.

### **6.5 Thickness measurements**

**6.5.1** The minimum requirements for thickness measurements at class renewal survey are given in Tab 3. Thickness measurement of stainless steel hull structure and piping may be waived, except for clad steel plating.

**6.5.2** Provisions for extended measurements for areas with substantial corrosion are given in Tab 4 and as may be additionally specified in the survey program as required in [6.1]. These extended thickness measurements are to be carried out before the survey is credited as completed.

Suspect areas identified at previous class renewal surveys are to be examined.

Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

The Surveyor may further extend the thickness measurements as deemed necessary.

**Table 3 : Requirements for thickness measurements at class renewal survey of chemical tankers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
Suspect areas	Suspect areas	Suspect areas	Suspect areas
	Within the cargo area: <ul style="list-style-type: none"> <li>each deck plate</li> <li>one transverse section (1)</li> </ul>	Within the cargo area: <ul style="list-style-type: none"> <li>each deck plate</li> <li>two transverse sections (1) (2)</li> <li>selected bottom plates</li> <li>all wind and water strakes</li> </ul>	Within the cargo area: <ul style="list-style-type: none"> <li>each deck plate</li> <li>three transverse sections (1) (2)</li> <li>each bottom plate</li> </ul>
	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 1 or Tab 2, as applicable	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 1 or Tab 2, as applicable	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 1 or Tab 2, as applicable
	Selected wind and water strakes outside the cargo area	Selected wind and water strakes outside the cargo area	All wind and water strakes full length
<p>(1) Transverse sections are to be chosen where the largest reductions are likely to occur or as revealed by deck plating measurements.</p> <p>(2) At least one section is to be within 0,5 L amidships and, where applicable, in way of a ballast tank.</p>			

**Table 4 : Extended thickness measurements at those areas of substantial corrosion  
Class renewal survey of chemical tankers within the cargo area length**

BOTTOM, INNER BOTTOM AND HOPPER STRUCTURE		
Structural member	Extent of measurement	Pattern of measurement
Bottom, inner bottom and hopper structure plating	Minimum of 3 bays across tank, including aft bay Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
Bottom, inner bottom and hopper structure longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across the flange and 3 measurements on vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of 3 measurements 2 measurements across face flat where fitted
Bottom floors, including the watertight ones	3 floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over 2 m <sup>2</sup> area
Hopper structure web frame ring	3 floors in bays where bottom plating measured	5-point pattern over 1 m <sup>2</sup> of plating Single measurements on flange
Hopper structure transverse watertight bulkhead or swash bulkhead	• lower 1/3 of bulkhead	• 5-point pattern over 1 m <sup>2</sup> of plating
	• upper 2/3 of bulkhead	• 5-point pattern over 2 m <sup>2</sup> of plating
	• stiffeners (minimum of 3)	• For web, 5-point pattern over span (2 measurements across web at each end and 1 at centre of span). For flange, single measurements at each end and centre of span
Panel stiffening	Where applicable	Single measurements

<b>DECK STRUCTURE</b>		
Structural member	Extent of measurement	Pattern of measurement
Deck plating	2 transverse bands across tank	Minimum of 3 measurements per plate per band
Deck longitudinals	Every third longitudinal in each of 2 bands with a minimum of one longitudinal	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of 3 measurements 2 measurements across flange 5-point pattern on girder/bulkhead brackets
Deck transverse webs	Minimum of 2 webs, with measurements at both ends and middle of span	5-point pattern over 1 m <sup>2</sup> area Single measurements on flange
Vertical web and transverse bulkhead in wing ballast tank for double hull design (2 metres from deck)	Minimum of 2 webs, and both transverse bulkheads	5-point pattern over 1 m <sup>2</sup> area
Panel stiffening	Where applicable	Single measurements

<b>SIDE SHELL AND LONGITUDINAL BULKHEADS</b>		
Structural member	Extent of measurement	Pattern of measurement
Side shell and longitudinal bulkhead plating: <ul style="list-style-type: none"> <li>deckhead and bottom strakes and strakes in way of the horizontal girders</li> <li>all other strakes</li> </ul>	<ul style="list-style-type: none"> <li>Plating between each pair of longitudinals in a minimum of 3 bays (along the tank)</li> <li>Plating between every third pair of longitudinals in same 3 bays</li> </ul>	Single measurement
Side shell and longitudinal bulkhead longitudinals on: <ul style="list-style-type: none"> <li>deckhead and bottom strakes</li> <li>all other strakes</li> </ul>	<ul style="list-style-type: none"> <li>Each longitudinal in same 3 bays</li> <li>Every third longitudinal in same 3 bays</li> </ul>	3 measurements across web and 1 measurement on flange
Longitudinals - brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5-point pattern over area of bracket
Vertical web and transverse bulkheads of double side tanks (excluding deck area): <ul style="list-style-type: none"> <li>strakes in way of horizontal girders</li> <li>other strakes</li> </ul>	<ul style="list-style-type: none"> <li>Minimum of 2 webs and both transverse bulkheads</li> <li>Minimum of 2 webs and both transverse bulkheads</li> </ul>	<ul style="list-style-type: none"> <li>5-point pattern over approximately 2 m<sup>2</sup> area</li> <li>2 measurements between each pair of vertical stiffeners</li> </ul>
Web frames and cross ties for other tanks than double side tanks	3 webs with minimum of 3 locations on each web, including in way of cross tie connections and lower end bracket	5-point pattern over approximately 2 m <sup>2</sup> area of webs, plus single measurements on flanges of web frame and cross ties
Horizontal girders	Plating on each girder in a minimum of 3 bays	2 measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements

TRANSVERSE WATERTIGHT AND SWASH BULKHEADS		
Structural member	Extent of measurement	Pattern of measurement
Upper and lower stool, where fitted	<ul style="list-style-type: none"> <li>Transverse band within 25 mm of welded connection to inner bottom/deck plating</li> <li>Transverse band within 25 mm of welded connection to shelf plate</li> </ul>	5-point pattern between stiffeners over 1 m length
Deckhead and bottom strakes, and strakes in way of horizontal stringers	Plating between pair of stiffeners at 3 locations: approximately 1/4, 1/2 and 3/4 width of tank	5-point pattern between stiffeners over 1 m length
All other strakes	Plating between pair of stiffeners at middle location	Single measurement
Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5-point pattern over about 1 m <sup>2</sup> of plating
Stiffeners	Minimum of 3 typical stiffeners	For web, 5-point pattern over span between bracket connections (2 measurements across web at each bracket connection and 1 at centre of span). For flange, single measurements at each bracket toe and at centre of span
Brackets	Minimum of 3 at top, middle and bottom of tank	5-point pattern over area of bracket
Horizontal stringers	All stringers with measurements at both ends and middle	5-point pattern over 1 m <sup>2</sup> area, plus single measurements near bracket toes and on flanges
Deep webs and girders	Measurements at toe of bracket and at centre of span	For web, 5 point pattern over about 1 m <sup>2</sup> . 3 measurements across face flat

**6.5.3** When pitting is found on bottom plating and its intensity is 20% or more, thickness measurements are to be extended in order to determine the actual plate thickness out of the pits and the depth of the pits. Where the wastage is in the substantial corrosion range or the average depth of pitting is 1/3 or more of the actual plate thickness, the pitted plate is to be considered as a substantially corroded area.

**6.5.4** For areas in tanks where hard protective coatings are found to be in good condition, the extent of thickness measurements according to Tab 3 may be specially considered by the Society.

## 6.6 Tank testing

**6.6.1** The requirements for tank testing at class renewal survey are given in Tab 5.

**Table 5 : Requirements for tank testing at class renewal survey of chemical tankers**

Age of ship (in years at time of class renewal survey)	
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 and subsequent age >5
All ballast tank boundaries	All ballast tank boundaries
Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	All cargo tank bulkheads

**6.6.2** Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor, provided the following conditions are complied with:

- a tank testing procedure, specifying fill heights, tanks being filled and bulkheads being tested, has been submitted by the Owner and reviewed by the Society prior to the testing being carried out
- there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank
- the tank testing has been satisfactorily carried out within the class renewal survey window, not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed
- the satisfactory results of the testing is recorded in the ship's logbook
- the internal and external conditions of the tanks and associated structures are found satisfactory by the Surveyor at the time of the overall and close-up surveys.

**6.6.3** The Surveyor may extend the tank testing as deemed necessary.

**6.6.4** Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.

Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

## **6.7 Cargo piping, cargo pump rooms and cargo tanks**

**6.7.1** Cargo piping on deck and cargo and ballast piping within the tanks specified in [6.3.2] are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces. Surveyors are to be advised on all occasions when this piping, including valves and fittings, is opened during repair periods and can be examined internally.

The Surveyor may require dismantling and/or thickness measurements of piping. A hydraulic test is to be carried out in the event of repair or dismantling of cargo or ballast piping, or where doubts arise.

Vent line drainage arrangements are to be examined.

**6.7.2** It is to be verified that cargo piping and independent cargo tanks, where applicable, are electrically bonded to the hull.

**6.7.3** For ships over 10 years of age, selected steel cargo pipes outside cargo tanks, cargo/slop discharge pipes passing through ballast tanks and void spaces and ballast pipes passing through cargo tanks are to be:

- subjected to thickness measurement at random, or selected pipe lengths are to be opened for internal inspection
- pressure tested to the maximum working pressure.

**6.7.4** All safety valves on cargo piping and of cargo tanks are to be dismantled for examination, adjusted and, as applicable, resealed.

**6.7.5** All cargo pump room boundaries are to be generally examined. All gas-tight shaft sealing devices are to be examined. The bottom of cargo pump rooms is to be presented clean for the examination of stripping devices and gutters.

## **6.8 Emergency towing arrangement**

**6.8.1** The survey is to include:

- an examination of the emergency towing arrangement
- confirmation that the arrangement is readily available with aft towing arrangement pre-rigged and forward chafing gear secured to the strong-point
- an examination of the pick-up gear, towing pennant and chafing gear over the full length for possible deterioration. Where the pennant line is stored in a watertight condition and can be confirmed as being maintained, consideration may be given to waiving the requirement to examine the pennant line over the full length
- an examination of the strong-points, fairleads and pedestal roller together with their attachments to the hull structure.

## **7 Class renewal survey - Cargo machinery items**

### **7.1 Cargo area and cargo pump rooms**

**7.1.1** Ballast and stripping pumps are to be internally examined and prime movers checked. A working test is to be carried out. Maintenance records of cargo pumps are to be made available to the Surveyor.

**7.1.2** Where a washing system is fitted, piping, pumps, valves and deck-mounted washing machines are to be examined and tested for signs of leakage, and anchoring devices of deck-mounted washing machines are to be checked to the Surveyor's satisfaction.

**7.1.3** The satisfactory condition of the cargo heating/cooling system is to be verified and, if deemed necessary by the Surveyor, the system is to be pressure tested.

**7.1.4** Spares for cargo area mechanical ventilation fans are to be available on board.

**7.1.5** Heat exchangers and anti-sparking fans are to be examined.

**7.1.6** An operating test of the remote control of pumps and valves and of automatic closing valves is to be carried out.

**7.1.7** A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

The electrical insulation resistance of the electrical equipment and circuits terminating in or passing through the dangerous zones is to be tested; however, in cases where a proper record of testing is maintained, consideration may be given to accepting recent test readings effected by the ship's personnel.

## **7.2 Fire-fighting systems in cargo area**

**7.2.1** The survey is to include the examination of fire-fighting systems of any type fitted on board for the protection of the cargo area, cargo pump room and other dangerous spaces, such as deck foam, water-spraying and dry powder systems, as applicable in accordance with the relevant requirements given in Ch 3, Sec 3, [3.8].

## **7.3 Inert gas system**

**7.3.1** The requirements given in [5.2] for intermediate survey are to be complied with.

**7.3.2** If an inert gas system such as that installed on board oil tankers is fitted, the requirements given in Ch 4, Sec 3, [7.3] for class renewal survey of oil tankers are to be complied with.

## **7.4 Personnel protection**

**7.4.1** The requirements given in [5.3] are to be complied with.

# **8 Methanol Bunkering**

## **8.1 Application**

**8.1.1** The requirements of this Article apply to **chemical tankers** which have been assigned the additional service feature **Methanol bunkering**.

## **8.2 General**

**8.2.1** The bunkering installation including piping, inerting systems, electric installations, fire fighting systems and safety and control systems are to be examined during annual and class renewal surveys as required for cargo related systems.

## **8.3 Annual survey**

**8.3.1** In addition to [8.2.1], the annual survey is to include the following items:

- visual examination of the bunkering station
- checking the proper functioning of the mechanical ventilation of the bunkering station
- checking the availability of the required documents for bunkering hoses
- checking the maintenance and inspection records of the transfer system
- inspection of the bunkering hoses
- inspection of the Quick Connect Disconnect couplers (QCDC)
- inspection of the break-away and Emergency Release Couplings (ERC)
- checking the proper functioning of the transfer arm, if applicable
- checking the proper functioning of the communication system.

## **8.4 Class renewal surveys**

**8.4.1** The requirements given in [8.3.1] for annual survey are to be complied with.

# Section 5 Liquefied Gas Carriers

## 1 General

### 1.1 Application

**1.1.1** The requirements of this Section apply after construction to all self-propelled ships which have been assigned one of the following service notations:

- **liquefied gas carrier**
- **liquefied gas carrier - FSRU**
- **liquefied gas carrier - FSU**

**1.1.2** The requirements apply to:

- the surveys of installations and equipment related to the carriage and handling of liquefied and revaporized gas when applicable, and
- the surveys of hull structure and related piping systems in way of cargo tanks, pump rooms, compressor rooms, cofferdams, pipe tunnels, void spaces and fuel oil tanks within the cargo area, and
- the surveys of all ballast tanks, and
- when fitted: revaporization area and area of equipment for non permanent mooring, and for unloading to single buoy.

They are additional to the requirements applicable to the remainder of the ship, given in Part A, Chapter 3, according to the relevant surveys.

**1.1.3** The requirements contain the minimum extent of examination, thickness measurements and tank testing. When substantial corrosion, as defined in Ch 2, Sec 2, [2.2.7], and/or structural defects are found, the survey is to be extended and is to include additional close-up surveys when necessary.

**1.1.4** In any kind of survey, i.e. class renewal, intermediate, annual or other surveys having the same scope, thickness measurements, when required by Tab 3, of structures in areas where close-up surveys are required are to be carried out simultaneously with close-up surveys.

**1.1.5** Consideration may be given by the attending Surveyor to allow use of remote inspection techniques (RIT) as an alternative to close-up survey, as defined in Ch 2, Sec 2. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor.

When RIT is used for a close-up survey, temporary means of access for the corresponding thickness measurements as specified in this section is to be provided unless such RIT is also able to carry out the required thickness measurements.

For surveys conducted by use of a remote inspection technique, one or more of the following means of access, acceptable to the Surveyor, is to be provided:

- unmanned robot arm
- remote operated vehicle (ROV)
- unmanned aerial vehicles/drones
- other means acceptable to the Society.

**1.1.6** When, in any survey, thickness measurements are required:

- the procedure detailed in Ch 2, Sec 2, [2.3] is to be applied
- the thickness measurement operator is to attend the survey planning meeting held prior to commencing the survey.

## 2 Annual survey - Hull items

### 2.1 General

**2.1.1** The annual survey of cargo containment and cargo handling systems is preferably carried out during loading or unloading operations. Access to cargo tanks and/or inerted hold spaces is normally not required.

**2.1.2** Gas plant operational record (log) entries since the last survey are to be examined in order to check the past performance of the system and to establish whether certain parts have shown any irregularities in operation. The boil-off rate, the hours per day of the reliquefaction plants and the inert gas consumption are also to be considered.

**2.1.3** The relevant instruction and information material such as cargo handling plans, filling limit information, cooling down procedures, are to be verified as being onboard.

**2.1.4** Examination of the condition of all piping systems, except those covered by [2.3].

Note 1: For survey of air pipes, flame screens on vents and ventilators, refer to Ch 3, Sec 1, [2.1.1].

## **2.2 Weather decks and suspect areas**

**2.2.1** Examination of flame screens on vents to all bunker tanks.

**2.2.2** Examination the cargo, bunker, ballast and vent piping systems, including PRVs, vacuum relief valves, vent masts and protective screens.

**2.2.3** Suspect areas identified at previous surveys are to be examined. Thickness measurements are to be taken of the areas of substantial corrosion and the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion, as per the requirements of Tab 4.

These extended thickness measurements are to be carried out before the annual survey is credited as completed.

## **2.3 Cargo handling rooms and piping**

**2.3.1** The survey is to include:

- examination of cargo pump rooms, compressor rooms and cargo control rooms and, as far as practicable, pipe tunnels if fitted
- examination of the cargo machinery spaces and turret compartments, including their escape routes
- examination of all pump room and compressor room bulkheads for signs of leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room and compressor room bulkheads
- examination of all accessible gas-tight bulkhead penetrations including gas-tight shaft sealings
- examination of the sealing arrangements for tanks or tank domes penetrating decks or tank covers
- examination of the means for accomplishing gas tightness of the wheelhouse doors and windows. All windows and sidescuttles within the area required to be of the fixed type (non-opening) are to be examined for gas tightness. The closing devices for all air intakes and openings into accommodation spaces, service spaces, machinery spaces, control stations and approved openings in superstructures and deckhouses facing the cargo area or bow and stern loading/unloading arrangements, are to be examined
- examination of cargo and process piping, including the expansion arrangements, insulation from the hull structure, pressure relief and drainage arrangements and water curtain protection as appropriate
- examination of venting systems, including vent masts and protective screens, for cargo tanks, interbarrier spaces, hold spaces, fuel tanks and ballast tanks
- examination of cargo tank and interbarrier space relief valves and associated safety systems and alarms
- confirmation that the certificate for the relief valve opening/closing pressures is on board and that the cargo tank relief valves are sealed
- examination of drip trays or insulation for deck protection against cargo leakage
- confirmation of proper maintenance of arrangements for the airlocks
- confirmation that all accessible cargo piping systems are electrically bonded to the hull
- visual examination of arrangements for burning methane boil-off as far as practicable.

## **2.4 Other arrangements or devices**

**2.4.1** The survey is to include:

- confirmation that any liquid and vapour hoses are suitable for their intended purpose and in satisfactory condition and, where appropriate, type-approved or marked with date of testing
- confirmation that any special arrangement made for bow or stern loading/unloading is satisfactory
- confirmation that, if applicable, the provisions made for products which have special arrangements as per Pt D, Ch 9, Sec 17 are satisfactory
- confirmation that any special arrangements to survive conditions of damage are satisfactory
- examination, where applicable, of the alternative design and arrangements for the segregation of the cargo area, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation

## **2.5 Ballast tanks**

**2.5.1** Ballast tanks are to be internally examined when required as a consequence of the results of the class renewal survey or the intermediate survey; see [6.3.7] and footnote (3) of Tab 1, respectively.

**2.5.2** When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements are to be increased to determine the extent of areas of substantial corrosion in accordance with the requirements given in Tab 4. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

## **2.6 Emergency towing arrangement**

**2.6.1** The Owner or his representative is to declare to the attending Surveyor that no significant alterations have been made, without prior approval from the Society, to the equipment and arrangements fitted on board in accordance with the provisions given in Pt B, Ch 12, Sec 4, [3].

**2.6.2** The survey is to include:

- an examination, as far as practicable, of the emergency towing arrangement
- confirmation that the aft towing arrangement is pre-rigged and forward chafing gear is secured to the strong-point
- confirmation of the proper functioning of the light, where it is provided, on the pick-up gear marker buoy.

## **3 Annual survey - Cargo machinery items**

### **3.1 Cargo area and cargo pump rooms**

**3.1.1** The survey is to include:

- examination of mechanical ventilation fans in gas-dangerous spaces and zones
- examination, as far as practicable, and confirmation of the satisfactory operation of the arrangements for the artificial ventilation of spaces in the cargo area normally entered during operation
- examination and confirmation of the arrangements for the artificial ventilation of spaces normally entered other than above
- examination, as far as possible during operation, of the cargo handling piping and machinery, e.g. cargo and process piping, cargo heat exchangers, vaporizers, pumps, compressors and hoses.
- confirmation that fixed and/or portable ventilation arrangements provided for spaces not normally entered are satisfactory
- confirmation that the manually operated ESD (emergency shutdown) system together with the automatic shutdown of the cargo pumps and compressors are satisfactory
- examination of the gas detection safety arrangements for cargo control rooms and of the measures taken to exclude ignition sources when such spaces are classified as hazardous areas
- examination of cargo (if accessible), bilge, ballast and stripping pumps for excessive gland seal leakage
- confirmation that electrical equipment in hazardous areas is in satisfactory condition and has been properly maintained
- examination, as far as possible, of arrangements for the use of cargo as fuel, and associated instrumentation and safety devices.
- confirmation that, if fitted, cargo reliquefaction or refrigeration equipment is in satisfactory condition
- confirmation that relevant instruction and information material such as cargo handling plans, filling limit information, cooling down procedures, etc., is available on board.

### **3.2 Instrumentation and safety devices**

**3.2.1** The survey is to include:

- confirmation that installed pressure gauges on cargo discharge lines are operational (see Note 1)
- confirmation that cargo tank liquid level gauges are operational and that high level alarms as well as automatic shut-off systems are satisfactory (see Note 1)
- confirmation that the temperature indicating equipment of the cargo containment system and associated alarms are satisfactory (see Note 1)
- examination of the logbooks for confirmation that the emergency shutdown system has been tested
- confirmation that cargo tank, hold and insulation space pressure gauging systems and associated alarms are satisfactory (see Note 1)
- examination, and testing as appropriate, of fixed gas detection equipment
- examination of the arrangements for the cargo pressure / temperature control including, when fitted, the thermal oxidation systems and any refrigeration system and confirming that any associated safety measures and alarms are satisfactory
- confirmation of the availability and suitability of the portable gas detection equipment and instruments for measuring oxygen levels

Note 1: Verification of these devices is to be done by one or more of the following methods:

- visual external examination
- comparing of read outs from different indicators
- consideration of read outs with regard to the actual cargo and/ or actual conditions
- examination of maintenance records with reference to cargo plant instrumentation maintenance manual
- verification of calibration status of the measuring instruments.

### 3.3 Fire-fighting systems in cargo area

3.3.1 The survey is to include:

- examination of fire-fighting systems of any type fitted on board for the protection of the cargo area, cargo pump room, cargo compressor room and other dangerous spaces, such as deck foam, water-spraying and dry powder systems, as applicable in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4], including testing of the remote means of starting one main fire pump
- examination of the fixed fire-fighting system for the enclosed cargo machinery spaces, and the enclosed cargo motor room within the cargo area, and confirmation that its means of operation is clearly marked
- examination of the appropriate fire-extinguishing system for the enclosed cargo machinery spaces for ships that are dedicated to the carriage of a restricted number of cargoes and the internal water spray system for the turret compartments and confirmation that their means of operation is clearly marked.

### 3.4 Environmental control for cargo containment systems

3.4.1 The survey is to include:

- the examinations and tests as provided for the annual survey of inert gas systems of oil tankers, given in Ch 4, Sec 3, [3.4]
- confirmation that the use of inert gas has not increased beyond that needed to compensate for normal losses by examining records of inert gas usage
- confirmation that arrangements are made for sufficient inert gas to be carried to compensate for normal losses and that means are provided for monitoring the spaces
- confirmation that the means for prevention of backflow of cargo vapour to gas-safe spaces are in satisfactory operating condition
- confirmation that any air drying system and any interbarrier and hold space purging inert gas system are satisfactory
- for membrane containment systems normal operation of the nitrogen control system for insulation and interbarrier spaces shall be confirmed to the Surveyor by the Master.

## 4 Intermediate survey - Hull items

### 4.1 General

4.1.1 A survey planning meeting is to be held prior to the commencement of the survey.

### 4.2 Weather decks, cargo handling rooms and piping

4.2.1 The survey is to include:

- examination, as far as applicable, of cargo and process, liquid nitrogen (if any), ballast, stripping and vent piping systems as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, pressure testing, thickness measurement or both may be required
- examination of vent line drainage arrangements
- confirmation that cargo pipes and independent cargo tanks, where applicable, are electrically bonded to the hull.

### 4.3 Ballast tanks

4.3.1 The requirements for survey of ballast tanks given in Tab 1 are to be complied with.

4.3.2 For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered by the Society.

Table 1 : Intermediate survey of ballast tanks for liquefied gas carriers

Age of ship (in years at time of intermediate survey)		
5 < age ≤ 10	10 < age ≤ 15	age > 15
Overall survey of representative ballast tanks, selected by the attending Surveyor See (1), (2) and (3)	Overall survey of all ballast tanks  See (1) and (3)	Overall survey of all ballast tanks  See (1) and (3)
	Close-up survey of: - all web frames and both transverse bulkheads in a representative ballast tank (4) and (5) - the upper part of one web frame in another representative ballast tank - one transverse bulkhead in another representative ballast tank (5)  See (6), (7) and (8)	Close-up survey of all web frames and both transverse bulkheads in two representative ballast tanks (4) and (5)  See (6), (7) and (8)
<p>(1) If such surveys reveal no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient.</p> <p>(2) If there is no hard protective coating, soft or semi-hard coating or poor coating condition, the examination is to be extended to other ballast tanks of the same type.</p> <p>(3) For ballast tanks, excluding double bottom tanks, if there is no hard protective coating, soft or semi-hard coating, or poor coating condition and it is not renewed, the tanks in question are to be internally examined at annual intervals. When such conditions are found in double bottom ballast tanks, the tanks in question may be internally examined at annual intervals.</p> <p>(4) Complete transverse web frame including adjacent structural members.</p> <p>(5) Transverse bulkhead complete, including girder system and adjacent members, and adjacent longitudinal bulkhead structure.</p> <p>(6) The extent of close-up surveys may be extended in accordance with the requirements of [6.4.3].</p> <p>(7) For areas in ballast tanks where protective coating is found to be in good condition, as defined in Ch 2, Sec 2, [2.2.14], the extent of close-up survey may be specially considered.</p> <p>(8) Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.</p>		

## 5 Intermediate survey - Cargo machinery items

### 5.1 General

**5.1.1** The aim of the intermediate survey is to supplement the annual survey by testing cargo handling installations with related automatic control, alarm and safety systems for correct functioning.

**5.1.2** The intermediate survey is preferably to be carried out with the ship in a gas-free condition. In fact, the extent of the testing required for the intermediate survey will normally be such that the survey cannot be carried out during a loading or discharging operation.

### 5.2 Cargo area and cargo pump rooms

**5.2.1** Electrical equipment and cables in hazardous areas and zones such as cargo machinery spaces and areas adjacent to and above cargo tanks are to be examined for defective equipment, fixtures and cables as far as practicable and tested with particular regard to:

- protective earthing (spot check)
- integrity of enclosures
- damage of outer sheath of cables
- function test of pressurised equipment and associated alarms
- test of systems for de-energising non-certified safe electrical equipment located in spaces protected by air-locks, such as electric motor rooms, cargo control rooms, etc.

**5.2.2** The electrical insulation resistance of the electrical equipment and circuits in dangerous zones is to be measured. These measurements are only to be effected when the ship is in a gas-free or inerted condition. Where a proper record of testing is maintained, consideration may be given to accepting recent readings by the ship's personnel.

**5.2.3** In addition to the requirements of [5.2.1] and [5.2.2], the survey also consists of:

- confirmation that the cargo heating/cooling system is in satisfactory condition
- confirmation that spares are provided for cargo area mechanical ventilation fans
- confirmation that the heating system of the hull structure is in satisfactory working condition
- general examination and test of leakage detection systems in interbarrier and hold spaces.

### **5.3 Instrumentation and safety devices**

**5.3.1** The survey is to include:

- examination of the installed pressure gauging systems on cargo discharge lines, cargo tanks, holds and insulation spaces and associated alarms
- examination of the cargo tank liquid level gauges and high level alarms as well as automatic shut-off systems
- examination of the temperature indicating equipment of the cargo containment system and associated alarms
- test of the above-mentioned instrumentation by changing pressure, level and temperature as applicable and comparing with test instruments. Simulated tests may be accepted for sensors which are not accessible or located within cargo tanks or inerted hold spaces. The test is to include alarm and safety functions
- examination, as far as practicable, of the piping of the gas detection system for corrosion and damage. The integrity of the suction lines between suction points and analysing units is to be verified as far as possible
- calibration of gas detectors or verification thereof with sample gases
- confirmation that two sets of portable gas detection equipment suitable for the cargoes to be carried and a suitable instrument for measuring oxygen levels are provided
- test of the manually operated emergency shutdown system (without flow in the pipelines) to verify that the system will cause the cargo pumps and compressors to stop.

**5.3.2** The arrangements for the use of cargo as fuel are to be examined, when applicable. It is to be tested, as far as practicable, that the gas supply to the machinery space is cut-off should the exhaust ventilation not be functioning correctly and that master gas fuel valve may be remotely closed from within the machinery space.

The instrumentation and safety systems for burning cargo as fuel are to be examined in accordance with [5.3.1].

### **5.4 Inert gas system**

**5.4.1** If an inert gas system such as that installed on board oil tankers is fitted, the requirements given in Ch 4, Sec 3, [5.2] for intermediate survey of oil tankers are to be complied with.

**5.4.2** In the case of low temperature liquid nitrogen storage, the plant and its associated arrangements for protecting the hull structure against liquid nitrogen leakage are to be examined.

### **5.5 Personnel protection**

**5.5.1** The survey is to include:

- confirmation that two complete sets of safety equipment each permitting personnel to enter and work in a gas-filled space are provided and properly stowed
- confirmation that the requisite supply of compressed air is provided and examination, when applicable, of the arrangements for any special air compressor and low-pressure air line system
- confirmation that the medical first-aid equipment, including stretchers and oxygen resuscitation equipment and antidotes, when available, for the products to be carried are provided
- confirmation that respiratory and eye protection suitable for emergency escape purposes are provided
- confirmation that decontamination arrangements and eyewashes are operational
- examination, when applicable, of the arrangements to protect personnel against the effects of a major cargo release by a special suitably designed and equipped space within the accommodation spaces.

## **6 Class renewal survey - Hull items**

### **6.1 Preparation for survey**

**6.1.1** The Owner is to provide the necessary facilities for a safe and practical execution of the surveys, including the means of providing access to structures for close-up survey, thickness measurements and tank testing. All other provisions described in Ch 2, Sec 2, [2.3], Ch 2, Sec 2, [2.5], Ch 2, Sec 2, [2.6], Ch 2, Sec 2, [2.7] and Ch 2, Sec 2, [2.9] regarding procedures for thickness measurements, conditions for survey, access to structures, equipment for survey and survey at sea or at anchorage, respectively, are also to be complied with.

**6.2 Survey programme**

**6.2.1** A specific survey programme is recommended to be worked out in advance of the class renewal survey by the Owner in cooperation with the Society.

**6.2.2** The survey programme is recommended to include conditions for survey, access to structures and equipment for surveys, taking into account the minimum requirements of Tab 2 and Tab 3 for close-up survey and thickness measurements, and [6.6] for tank testing.

**6.3 Scope of survey**

**6.3.1** A survey planning meeting is to be held prior to the commencement of the survey.

**6.3.2** In addition to the requirements of annual surveys, the class renewal survey is to include examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in [6.3.4], are in satisfactory condition and fit for the intended purpose for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

**6.3.3** Ballast tanks, including double bottom tanks, pump rooms, compressor rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in [6.5] and [6.6], to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration that may be present.

**6.3.4** All piping systems within the above spaces, are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

**6.3.5** The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.

Note 1: For survey of automatic air pipe heads, refer to Ch 3, Sec 3, Tab 1.

**6.3.6** As indicated in Ch 3, Sec 3, [2.1.1], a bottom survey in dry condition is to be a part of the class renewal survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and water ballast tanks are to be carried out in accordance with the applicable requirements for class renewal surveys, if not already performed.

Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

**6.3.7** Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined.

For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in poor condition and it is not renewed, where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor.

When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

**6.3.8** Where the hard protective coating in ballast tanks is found to be in a good condition, the extent of close-up surveys and thickness measurements may be specially considered.

**Table 2 : Requirements for close-up survey of ballast tanks at class renewal survey of liquefied gas carriers**

Age of ship (in years at time of class renewal survey)		
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 and subsequent age > 10
One web frame in a representative ballast tank of the topside, hopper side and double hull side type <b>(1)</b>	All web frames in a ballast tank, which is to be a double hull side tank or a topside tank. If such tanks are not fitted, another ballast tank is to be selected <b>(1)</b>	All web frames in all ballast tanks <b>(1)</b>
	One web frame in each remaining ballast tank <b>(1)</b>	
One transverse bulkhead <b>(3)</b> , in a ballast tank	One transverse bulkhead in each ballast tank <b>(2)</b>	All transverse bulkheads in all ballast tanks <b>(2)</b>
<p><b>(1)</b> Complete transverse web frame including adjacent structural members.  <b>(2)</b> Transverse bulkhead complete, including girder system and adjacent members, and adjacent longitudinal bulkhead structure.  <b>(3)</b> Transverse bulkhead lower part, including girder system and adjacent structural members.  <b>Note 1:</b> Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.</p>		

**6.4 Overall and close-up surveys**

**6.4.1** An overall survey of all tanks and spaces, excluding fuel oil, lube oil and fresh water tanks, is to be carried out at each class renewal survey. However, for fuel oil, lube oil and fresh water tanks, the requirements given in Ch 3, Sec 3, Tab 2 are to be complied with.

**6.4.2** Each class renewal survey is to include a close-up examination of sufficient extent to establish the condition of cargo tanks and ballast tanks. The minimum requirements for close-up surveys are given in Tab 2 for ballast tanks and in [6.7.3] for cargo tanks.

**6.4.3** The Surveyor may extend the close-up survey as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

- in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information
- in tanks having structures approved with reduced scantlings.

**6.4.4** For areas in tanks where hard protective coatings are found to be in good condition, as defined in Ch 2, Sec 2, [2.2.14], the extent of close-up surveys required according to Tab 2 may be specially considered by the Society.

For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of close-up surveys of ballast tanks may be specially considered by the Society.

Note 1: For survey of automatic air pipe heads, reference is to be made to Ch 3, Sec 3, Tab 1.

**6.5 Thickness measurements**

**6.5.1** The minimum requirements for thickness measurements at class renewal survey are given in Tab 3.

**6.5.2** The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion in accordance with the requirements given in Tab 4.

**6.5.3** For areas in tanks where hard protective coatings are found to be in good condition as defined in Ch 2, Sec 2, [2.2.14], the extent of thickness measurements according to Tab 3 may be specially considered by the Society.

**6.5.4** For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of thickness measurements may be increased to the tank top plating to the satisfaction of the Surveyor.

**6.5.5** Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

**Table 3 : Requirements for thickness measurements at class renewal survey of liquefied gas carriers**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
Suspect areas	Suspect areas	Suspect areas	Suspect areas
One section of deck plating for the full beam of the ship within 0,5 L amidships in way of a ballast tank, if any	Within the cargo area: <ul style="list-style-type: none"> <li>• each deck plate</li> <li>• one transverse section within 0,5 L amidships in way of a ballast tank, if any</li> </ul>	Within the cargo area: <ul style="list-style-type: none"> <li>• each deck plate</li> <li>• two transverse sections (1)</li> <li>• all wind and water strakes</li> </ul>	Within the cargo area: <ul style="list-style-type: none"> <li>• each deck plate</li> <li>• three transverse sections (1)</li> <li>• each bottom plate</li> <li>• duct keel plating and internals</li> </ul>
Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 2	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 2	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 2	Measurements, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 2
	Selected wind and water strakes outside the cargo area	Selected wind and water strakes outside the cargo area	All wind and water strakes full length
(1) at least one section is to include a ballast tank within 0,5 L amidships, if any.			

**Table 4 : Requirements for extent of thickness measurements at those areas of substantial corrosion**

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect area and adjacent plates	5-point pattern over 1 m <sup>2</sup> of plating
Stiffeners	Suspect area	3 measurements each in line across web and flange

## 6.6 Tank testing

**6.6.1** All boundaries of ballast tanks and deep tanks used for water ballast within the cargo area are to be pressure tested. For fuel oil tanks, the representative tanks are to be pressure tested.

**6.6.2** The Surveyor may extend the tank testing as deemed necessary.

**6.6.3** Tank testing of fuel oil tanks is to be carried out with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.

## 6.7 Cargo tank structure

**6.7.1** All cargo tanks are to be cleaned and examined internally.

**6.7.2** When accessible, the outer surface of uninsulated cargo tanks or the outer surface of cargo tank insulation together with any vapour or protective barrier is to be examined. Special attention is to be given to the tank and insulation in way of chocks, supports and keys. Removal of insulation, in part or entirely, may be required in order to verify the condition of the tank or the insulation itself if deemed necessary by the Surveyor.

Where the arrangement is such that the insulation cannot be examined entirely, the surrounding structures of wing tanks, double bottom tanks and cofferdams are to be examined for cold spots when the cargo tanks are in the cold condition, unless voyage records together with the instrumentation give sufficient evidence of the integrity of the insulation system.

**6.7.3** Thickness measurements may be required if deemed necessary by the Surveyor.

Close-up surveys are to be carried out in independent cargo tanks of type B and C at those areas where corrosion may develop.

**6.7.4** Non-destructive testing is to supplement cargo tank inspection with special attention to be given to the integrity of the main structural members, tank shell and highly stressed parts, including welded connections as deemed necessary by the Surveyor.

However, for type C tanks, this does not mean that non-destructive testing can be dispensed with totally.

The following items are, inter alia, considered highly stressed areas:

- cargo tank supports and anti-rolling or anti-pitching devices
- web frames or stiffening rings
- Y-connection of shell plates and longitudinal bulkhead of bilobe tanks
- swash bulkhead boundaries
- dome and stump connections to the shell plating
- foundations for pumps, towers, ladders, etc.
- pipe connections.

**6.7.5** For independent tanks of type B, the extent of non-destructive testing is to be as given in a program specially prepared for the cargo tank design.

**6.7.6** The tightness of all cargo tanks is to be verified by an appropriate procedure. Provided that the effectiveness of the ship's gas detection equipment has been confirmed, it will be acceptable to utilise this equipment for the tightness test of independent tanks below deck.

**6.7.7** Where the results of the examinations dealt with in [6.7.1] to [6.7.6] or the examination of the voyage records raise doubts as to the structural integrity of a cargo tank, a hydraulic or hydropneumatic test is to be carried out.

For integral tanks and for independent tanks of type A and B, the test pressure is not to be less than the MARVS.

For independent tanks of type C, the test pressure is not to be less than 1,25 times the MARVS.

**6.7.8** When the ship is 10 years old, at every alternate class renewal survey, independent cargo tanks of type C are to be either:

- hydraulically or hydro-pneumatically tested to 1,25 times the MARVS, and thereafter non-destructively tested in accordance with [6.7.4], or
- subjected to thorough non-destructive testing in accordance with a program specially prepared for the tank design submitted by the Owner to the Society for acceptance. If a special program of non-destructive testing does not exist, special attention is to be given to the detection of surface cracks in welded connections in highly stressed areas as listed in [6.7.4]. At least 10% of the length of the welded connections in each of the above-mentioned areas is to be tested. This testing is to be carried out internally and externally, as applicable. Insulation is to be removed as necessary for the required non-destructive testing.

Where hold space atmosphere control is permanently maintained, the scope of external examination of the tanks and their supports may be reduced at the Surveyor's discretion.

**6.7.9** As far as accessible, hold spaces and hull insulation (if provided), secondary barriers and tank supporting structures are to be visually examined. The secondary barrier of tanks is to be checked for its effectiveness by means of a pressure/vacuum test, a visual examination or any other acceptable method.

**6.7.10** For membrane, semi-membrane and internal insulation tank systems, inspection and testing are to be carried out in accordance with programmes specially prepared in accordance with an approved method for the actual tank system.

For membrane containment systems, a tightness test of the primary and secondary barriers shall be carried out in accordance with the system designers' procedures and acceptance criteria as approved by the Society. Low differential pressure tests may be used for monitoring the cargo containment system performance, but they are not considered as an acceptable test for the tightness of the secondary barrier.

For membrane containment systems with glued secondary barriers, if the designer's threshold values are exceeded, an investigation is to be carried out and additional testing such as thermographic or acoustic emission testing should be carried out.

**6.7.11** All gas-tight bulkheads are to be examined and the effectiveness of gas-tight shaft sealing is to be verified.

**6.7.12** It is to be verified that independent cargo tanks are electrically bonded to the hull.

**6.7.13** The pressure relief valves for the cargo tanks are to be opened for examination, adjusted, function tested and sealed. If the cargo tanks are equipped with relief valves with non-metallic membranes in the main or pilot valves, these non-metallic membranes are to be replaced. Where a proper record of continuous overhaul and re-testing of individually identifiable relief valves is maintained, consideration may be given to acceptance on the basis of opening, internal examination and testing of a representative sample of valves, including each size and type of liquefied gas or vapour relief valves in use, provided there is evidence in the log-book that the remaining valves have been overhauled and tested since crediting of the previous class renewal survey.

## **6.8 Weather decks, cargo handling rooms and piping**

**6.8.1** Piping for cargo and process, liquid nitrogen (if any), ballast, stripping and venting systems is to be examined to the Surveyor's satisfaction and opened as deemed necessary. Insulation is to be removed as deemed necessary to ascertain the condition of the pipes. If the visual examination raises doubts as to the integrity of the pipelines, a pressure test at 1,25 times the MARVS for the pipeline is to be carried out. After reassembly the complete piping systems are to be tested for leaks.

It is to be verified that cargo piping systems are electrically bonded to the hull.

**6.8.2** The pressure relief valves on cargo piping are to be function tested. A random selection of valves is to be opened for examination and adjusted.

**6.8.3** All cargo pump room, compressor room and control room boundaries are to be generally examined. Gas-tight shaft sealing devices are to be examined. The bottom of cargo pump rooms and cargo compressor rooms is to be presented clean for the examination of stripping devices and gutters.

**6.8.4** Pressure/vacuum relief valves, rupture discs and other pressure relief devices for interbarrier spaces and/or hold spaces are to be examined and, if necessary, opened and tested in accordance with their design.

Vent line drainage arrangements are to be examined.

## **6.9 Emergency towing arrangement**

**6.9.1** The survey is to include:

- an examination of the emergency towing arrangement
- confirmation that the arrangement is readily available with aft towing arrangement pre-rigged and forward chafing gear secured to the strong-point
- an examination of the pick-up gear, towing pennant and chafing gear over the full length for possible deterioration. Where the pennant line is stored in a watertight condition and can be confirmed as being maintained, consideration may be given to waiving the requirement to examine the pennant line over the full length
- an examination of the strong-points, fairleads and pedestal roller together with their attachments to the hull structure.

## 7 Class renewal survey - Cargo machinery items

### 7.1 Cargo area, cargo pump rooms, cargo compressor rooms

**7.1.1** Ballast and stripping pumps are to be internally examined and prime movers checked. A working test is to be carried out. Maintenance records of cargo pumps are to be made available to the Surveyor.

**7.1.2** Electrical equipment and cables in dangerous zones such as cargo pump rooms, cargo compressor rooms and spaces adjacent to and areas above cargo tanks are to be examined as far as practicable and tested with particular regard to:

- protecting earthing (spot check)
- integrity of enclosures
- damage of outer sheath of cables
- function testing of pressurised equipment and associated alarms
- testing of systems for de-energising non-certified safe electrical equipment located in spaces protected by air-locks, such as electric motor rooms, cargo control rooms, etc.

**7.1.3** The electrical insulation resistance of the electrical equipment and circuits in dangerous zones is to be measured. These measurements are only to be effected when the ship is in a gas-free or inerted condition. Where a proper record of testing is maintained, consideration may be given to accepting recent readings by the ship's personnel.

**7.1.4** When there is a reliquefaction or refrigeration plant, and/or arrangements for the use of cargo as fuel, the corresponding machinery and equipment, such as cargo pumps, compressors, heat exchangers, condensers and process pressure vessels, are to be surveyed to the same extent as required for similar equipment on board oil tankers at the class renewal survey (refer to Ch 4, Sec 3).

**7.1.5** In addition to the requirements of [7.1.1] to [7.1.4], the survey also consists of:

- confirmation that spares are provided for cargo area mechanical ventilation fans
- confirmation that the installation for heating the hull structure is in satisfactory working condition
- general examination and testing of leakage detection systems in interbarrier spaces and hold spaces
- examination of gas detection piping system for corrosion or damage; checking, as far as possible, of the integrity of suction lines between suction points and analysing units
- examination and tests of systems for the removal of water from interbarrier spaces and hold spaces
- examination of portable equipment, such as hoses and spool pieces used for segregation of piping systems for cargo, inert gas and bilge pumping.

**7.1.6** Cargo pumps, compressors, process pressure vessels, liquid nitrogen tanks, heat exchangers and other components, including prime movers, used in connection with cargo handling and methane boil-off burning are to be surveyed according to the requirements of Part A, Chapter 3.

### 7.2 Fire-fighting systems in cargo area

**7.2.1** The survey is to include the examination of fire-fighting systems of any type fitted on board for the protection of the cargo area, cargo pump room, cargo compressor room and other dangerous spaces, such as deck foam, water-spraying, dry powder systems etc., as applicable in accordance with the relevant requirements given in Ch 3, Sec 3, [3.8].

### 7.3 Inert gas system

**7.3.1** If an inert gas system such as that installed on board oil tankers is fitted, the requirements given in Ch 4, Sec 3, [7.3] are to be complied with.

**7.3.2** In the case of low temperature liquid nitrogen storage, the plant and its associated arrangements for protecting the hull structure against liquid nitrogen leakage are to be examined.

### 7.4 Personnel protection

**7.4.1** The requirements given in [5.5] are to be complied with.

## 8 First loaded voyage of ships carrying liquefied natural gases (LNG) in bulk

### 8.1

**8.1.1** The survey requirements for the examination before and after the first loaded voyage for ships assigned with the service notation **liquefied gas carrier**, carrying liquefied natural gases (LNG) in bulk are to be carried out in accordance with Pt D, Ch 9, Sec 1, [6.2.4].

## 9 Revaporization installation

### 9.1 Application

9.1.1 The requirements of this Article are applicable to self-propelled ships which have been assigned the notations:

- liquefied gas carrier REGAS, or
- liquefied gas carrier REGAS STL-SPM

These requirements apply to the revaporization installation and to the area in way of this installation.

Reference is also made to other Articles of this Section for items dedicated to the revaporization installation such as cargo tanks or control stations.

### 9.2 Annual survey

#### 9.2.1 General

The annual survey of the revaporization installation is preferably carried out during unloading operations with this installation in operation.

Revaporization installation operational record entries (Bridge and Cargo logbooks) since the last survey are to be examined in order to check the past performance of the system and to establish whether certain parts have shown any irregularities in operation.

#### 9.2.2 Equipment in contact with gas or in gas dangerous areas

The survey is to include:

- a) examination of the cargo suction drum(s) and their sealing arrangements if applicable
- b) examination of the areas dedicated to revaporization equipment
- c) examination of closing devices of air intakes and openings into dedicated spaces for revaporization if applicable
- d) examination of cargo and process piping, including the expansion arrangements, insulation from the hull structure, pressure control valves, inlet/outlet valves, drainage arrangements and high pressure manifolds
- e) examination of the relief valves, their sealing and associated safety systems and alarms
- f) confirmation that the certificate for the relief valves opening/closing pressures is on board
- g) examination of high pressure pumps as far as practicable (including gland leakage and vibration indications)
- h) external examination of vaporizers and their fittings
- i) external examination of heat exchangers
- j) examination of drip trays or insulation for deck protection and recesses against cargo leakage in revaporization area
- k) confirmation that all accessible cargo piping systems and components (cargo suction drum(s), vaporizers, high pressure pumps) are electrically bonded to the hull.

#### 9.2.3 Instrumentation and safety devices

The survey is to include examination of pressure gauges, control valves, metering unit, temperature and vibration indicating equipment. Particular attention is to be given to high pressure pumps instrumentation and safety devices.

Confirmation that the instrumentation fitted on revaporization equipment and in contact with gas and associated alarms are satisfactory.

Examination and testing, as appropriate, of fixed gas detection equipment.

Examination of the logbooks for confirmation that the automatic emergency shut-down system has been tested. Confirmation that the automatic shut-down system is satisfactory.

#### 9.2.4 Other arrangements or devices

The survey is to include confirmation that:

- relevant shipboard instructions and procedures of the revaporization installation are available
- the revaporization control station is in satisfactory working condition.

Water spraying system against gas leakage is to be surveyed in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4].

Water deluge system is to be examined, including piping nozzles if fitted, and distribution valves. The starting of the pump is to be tested.

### 9.3 Intermediate survey

#### 9.3.1 General

The aim of the intermediate survey is to supplement the annual survey by testing the revaporization installation with related automatic control, alarm and safety systems for correct functioning.

### **9.3.2 Equipment in contact with gas or in gas dangerous areas**

The maintenance records of vaporizers are to be reviewed. If deemed necessary by the Surveyor, thickness measurements, pressure test and/or opening-up and internal examination as far as practicable may be required. Particular attention is to be given to rupture device if fitted.

The survey is also to include:

- a) examination, as far as applicable, of stripping and vent piping systems and high pressure manifolds of cargo and process. If upon examination there is any doubt as to the condition of the piping, pressure testing, thickness measurement or both may be required
- b) examination of vent line drainage arrangements
- c) confirmation that cargo pipes and revaporization components are electrically bonded to the hull
- d) random test of high pressure pumps lifting device
- e) thickness measurements of cargo suction drum(s) if deemed necessary by the Surveyor
- f) examination of electrical equipment according to [5.2].

### **9.3.3 Instrumentation and safety devices**

The survey is to include examination of pressure gauges, control valves, metering unit, liquid level gauges, temperature and vibration indicating equipment, and associated alarms. Particular attention is to be given to high pressure pumps instrumentation and safety devices.

The above mentioned instrumentation is to be tested by changing pressure, level and temperature as far as practicable and comparing with test instruments. Simulated tests may be accepted for sensors which are not accessible. The test is to include alarms and safety functions.

The manually operated emergency shut-down system is to be operationally tested to verify that the system will cause the revaporization installation to stop.

### **9.3.4 Other arrangements or devices**

Water deluge system is to be tested as deemed necessary by the Surveyor.

## **9.4 Class renewal survey**

### **9.4.1 General**

In addition to the requirements of annual surveys, the class renewal survey is to include examination, tests and checks of sufficient extent to ensure that the revaporization installation is in satisfactory condition for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

### **9.4.2 Cargo suction drum**

The following requirements apply:

- a) Cargo suction drum(s) is (are) to be presented clean and examined internally.
- b) When accessible, the outer surface of uninsulated cargo suction drum(s) or the outer surface of unit insulation together with any vapour or protective barrier is to be examined. Particular attention is to be given to the stocking unit and insulation in way of supports. Removal of insulation, in part or entirely, may be required in order to verify the condition of the unit or the insulation itself if deemed necessary by the Surveyor.
- c) Thickness measurements or non-destructive testing may be required if deemed necessary by the Surveyor.
- d) The tightness of cargo suction drums is to be verified by an appropriate procedure.
- e) Where the results of the examinations in items a) to e) or the examination of the operational records raise doubts as to the structural integrity of the unit, a hydraulic or hydro pneumatic test is to be carried out. The test pressure is not to be less than 1,25 times the MARVS.
- f) When the ship is 10 years old, at every alternate class renewal survey, cargo suction drum(s) is (are) to be either: hydraulically tested and thereafter non-destructively tested or subjected to thorough non-destructive testing as per [6.7.8].
- g) As far as accessible, the cargo suction drum(s) supporting structures are to be visually examined.
- h) Their fittings, valves and safety devices are to be opened up, as deemed necessary by the Surveyor, for visual examination and pressure tested as appropriate.

### **9.4.3 Equipment in contact with gas or in gas dangerous areas**

Piping for cargo and process, stripping, venting systems high pressure manifolds are to be examined to the Surveyor's satisfaction. Insulation is to be removed as deemed necessary to ascertain the condition of the pipes. If the visual examination raises doubts as to the integrity of the pipelines, a pressure test at 1,25 times the MARVS for the pipeline is to be carried out. After reassembly the complete piping systems are to be tested for leaks.

Maintenance records and log books of high pressure pumps including starting pumps are to be made available to the Surveyor. As deemed necessary by the Surveyor, the high pressure pumps are to be opened up for visual examination and their parts and components pressure tested. The lifting device is to be tested.

The bottom of the high pressure pump recess and vaporizer spaces are to be presented clean for the examination of gutters and stripping devices.

The pressure relief valves are to be opened for examination, adjusted, function tested and sealed. The valves including inlet/outlet valves, pressure control valves and discharge valves are to be tested for proper operation.

The maintenance records of vaporizers are to be reviewed. The Surveyor may require as considered necessary:

- external and internal examination of vaporizers which are to be presented clean
- opening up of their fittings, valves and safety devices for visual examination and pressure tests
- thickness measurements and/or pressure test
- confirmation that cargo pipes and revaporization components are electrically bonded to the hull.

Particular attention is to be taken in way of the vaporizer rupture device if fitted.

As deemed necessary by the Surveyor, the vaporizers heat exchangers are to be opened up for visual examination and their parts and components are to be pressure tested, as appropriate. A working test is also to be carried out, including testing of alarms and safety devices.

The electrical equipment are to be surveyed according to [7.1.2] and [7.1.3].

#### **9.4.4 Instrumentation and safety devices**

The survey is to include examination of pressure gauges, control valves, metering unit, liquid level gauges, temperature and vibration indicating equipment, and associated alarms. Particular attention is to be given to high pressure pumps instrumentation and safety devices.

The above mentioned instrumentation is to be tested by changing pressure, level and temperature as applicable and comparing with test instruments. Simulated tests may be accepted for sensors which are not accessible. The test is to include alarms and safety functions.

The emergency shut-down system is to be tested.

#### **9.4.5 Other arrangements or devices**

Water spraying system against gas leakage, when fitted, are to be surveyed in accordance with the relevant requirements given in Ch 3, Sec 3, [3.8].

For water deluge system:

- the associated pumps are to be opened up and examined at the Surveyor's discretion
- a working test is to be carried out.

## **10 STL-SPM**

### **10.1 Application**

**10.1.1** The requirements of this Article apply to self-propelled ships which have been assigned the notations **liquefied gas carrier REGAS STL-SPM**. These requirements apply to the installation for non permanent mooring or for connection to single buoy and for cargo unloading and to the area in way of this installation.

Reference is also made to above Articles of this Section for items dedicated to the STL-SPM installation such as ventilation or fire fighting.

### **10.2 Annual survey**

#### **10.2.1 General**

The Owner or his representative is to declare to the attending Surveyor that no significant alterations have been made without the prior approval of the Society.

Operational record (log) entries since the last survey are to be examined in order to check the past performance of the installation and to establish whether certain parts have shown any irregularities in operation.

#### **10.2.2 Piping and flexible riser**

The survey is to include:

- external examination of readily accessible parts including the outer sheath and the end fittings
- examination of pipes and their connections, of accessories including gas vent systems, bending restrictors, clamps and supports. Confirmation that there is no loose holding or connection
- examination of gas vent valves.

### **10.2.3 STL-SPM compartment, handling and connecting systems**

The annual survey is to include:

- a general examination of components of the installation including winches, heave compensator and sheaves, rope guides, capstans, rope, hatch system, locking mechanism, quick release unit, sealing devices, chain stoppers, fairleads, pedestal roller and covers to verify their satisfactory condition.
- an examination of the hull structures supporting and adjacent to the installation, to verify that no deformations or fractures have developed. Particular attention is to be given to the lower part of the trunk, intermittently in contact with sea water.
- confirmation that emergency escape route is practicable and not blocked
- a visual examination of the lower hatch covers, the sealing arrangements as far as practicable, the supporting and locking devices.

### **10.2.4 Swivel system**

The survey is to include:

- a) external examination of gas, electrical or/and hydraulic swivels with instrumentation and safety devices
- b) examination of piping systems including leak drainage system
- c) examination of connectors
- d) examination of handling arm when fitted
- e) tests of protective devices
- f) examination of support structure.

### **10.2.5 Others**

The survey is to include:

- a) examination of pressure gauges, control valves, temperature and vibration indicating equipment
- b) confirmation that the instrumentation dedicated to STL-SPM and associated alarms are satisfactory
- c) examination and testing, as appropriate, of fixed gas detection equipment
- d) examination of the vent line drainage arrangements and the trunk structure
- e) examination of blast relief panels and verification that they are kept clear
- f) examination of the logbooks for confirmation that the emergency and automatic shutdown systems have been tested and confirmation that they are satisfactory

## **10.3 Intermediate survey**

### **10.3.1 Cargo tanks requirements originated from STL-SPM**

The review of logbooks is to be carried out with particular attention to control and surveillance data such as temperature, pressure, gas leakage detection.

Cargo tank(s) may be internally examined if deemed necessary by the Surveyor.

### **10.3.2 Instrumentation, safety device and others**

The survey is to include examination of pressure gauges, control valves, liquid level gauges, temperature and vibration indicating equipment, and associated alarms.

The above mentioned instrumentation is to be tested by changing pressure, level and temperature as far as practicable and comparing with test instruments. Simulated tests may be accepted for sensors which are not accessible. The test is to include alarms and safety functions.

The emergency shutdown system is to be tested according to standard procedures (dry test).

If applicable, a test of quick disconnection (without flow in the pipelines) is to be carried out as far as practicable.

The drain pumps, including emergency pump are to be operationally tested.

## **10.4 Class renewal survey**

### **10.4.1 General**

In addition to the requirements of annual surveys, the class renewal survey is to include examination, tests and checks of sufficient extent to ensure that the STL-SPM installation is in satisfactory condition for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

Remote and/or automatic controls, alarms and safety devices are to be tested to demonstrate that they are in satisfactory condition.

### **10.4.2 Cargo tanks requirements originated from STL-SPM**

The surveys detailed in [6.7] are to be carried out taking into account possible sloshing at intermediate filling levels (i.e. for independent cargo tank, with particular attention to upper and lower parts of the pump tower and its supports).

### **10.4.3 Piping and flexible riser**

The survey is to include:

- a vacuum testing at vent holes in flexible pipe end fitting
- a pressure test if deemed necessary by the Surveyor
- an examination of the outer sheath. Removal of equipment hiding part of the pipe, may be required if deemed necessary by the Surveyor
- an internal examination, as far as practicable
- gas vent valves are to be examined and tested and, if deemed necessary by the Surveyor, opened up for internal examination.

### **10.4.4 STL-SPM compartment, handling and connecting systems**

An examination of components is to be carried out with opening as deemed necessary by the Surveyor to verify their condition. Control and safety devices are to be tested. Guides and sheaves are to be examined for wear.

Satisfactory operation of the hatch covers is to be checked.

Thickness measurements or other non-destructive tests may be required by the Surveyor, where deemed necessary.

### **10.4.5 Swivel systems**

The survey is to include:

- an internal examination of swivels
- a pressure test if deemed necessary by the Surveyor
- rotation tests, if deemed necessary, measurement of starting and running moments is to be carried out.

### **10.4.6 Instrumentation and safety devices**

The survey is to include examination of pressure gauges, control valves, metering unit, liquid level gauges, temperature and vibration indicating equipment, and associated alarms.

The above mentioned instrumentation is to be tested by changing pressure, level and temperature as far as practicable and comparing with test instruments. Simulated tests may be accepted for sensors which are not accessible. The test is to include alarms and safety functions.

The emergency shut-down system is to be tested according to standard procedures.

A test of quick disconnection (without flow in the pipelines) is to be carried out.

The drain pumps, including emergency pump are to be operationally tested.

## **10.5 Bottom survey**

**10.5.1** The bottom survey is to include, as far as practicable:

- a visual examination of the shell plating in the submerged buoy recess
- a visual examination and an operational test of the lower hatch, including opening, closing and securing.

## **11 Bunkering installations**

### **11.1 Application**

**11.1.1** The requirements of this Article apply to **liquefied gas carriers** which have been assigned the additional service feature **LNG bunkering** or **Ammonia bunkering**.

### **11.2 General**

**11.2.1** The bunkering installation including piping, inerting systems, electric installations, fire fighting systems and safety and control systems are to be examined during annual and class renewal surveys as required for cargo related systems.

### **11.3 Annual surveys**

**11.3.1** In addition to [11.2.1], the annual survey is to include the following items:

- visual examination of the bunkering station
- checking the proper functioning of the mechanical ventilation of the bunkering station
- checking the availability of the required documents for bunkering hoses
- checking the maintenance and inspection records of the transfer system
- inspection of the bunkering hoses
- inspection of the Quick Connect Disconnect couplers (QCDC)
- inspection of the break-away and Emergency Release Couplings (ERC)
- checking the proper functioning of the transfer arm, if applicable
- checking the proper functioning of the communication system.

## **11.4 Class renewal surveys**

**11.4.1** The requirements given in [11.3] for annual survey are to be complied with.

# Section 6 Ro-Ro Cargo Ships and Pure Car and/or Truck Carriers, Passenger Ships and Ro-Ro Passenger Ships

## 1 General

### 1.1

1.1.1 The requirements of this Section are applicable after construction to all self-propelled ships which have been assigned one of the following service notations:

- **ro-ro cargo ship**
- **PCTC**
- **PCC**
- **passenger ship**
- **ro-ro passenger ship.**

1.1.2 These requirements are additional to those laid down in Part A, Chapter 3, according to the relevant surveys.

## 2 Ro-ro cargo ships and pure car and/or truck carriers - Annual survey

### 2.1 Shell and inner doors

2.1.1 The requirements of this item apply to all shell and inner doors fitted on these ships.

2.1.2 For the scope of survey of shell and inner doors, the following definitions are applicable:

- **Securing device:** a device used to keep the door closed by preventing it from rotating about its hinges
- **Supporting device:** a device used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure
- **Locking device:** a device that locks a securing device in the closed position.

2.1.3 It is to be checked that the operating procedures for closing the shell and inner doors are kept on board and posted at appropriate places.

When required, the Operating and Maintenance Manual is also to be checked for the verification of its approval and of any modification, reported repairs and proper endorsement by operating personnel.

Confirmation is to be obtained that no unapproved changes have been made to the bow, inner, side shell and stern doors since the last survey.

2.1.4 The structural arrangements as well as welding are to be examined, including:

- plating, primary structure and secondary stiffeners
- hinging arms, hinges and bearings, thrust bearings
- hull and door side supports of securing, supporting and locking devices
- shell plating surrounding the openings and the securing, supporting and locking devices.

Clearances of hinges, bearings and thrust bearings are to be taken, where no dismantling is required. Where the function test is not satisfactory, dismantling may be required to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings together with NDT of the hinge pin is to be carried out. Clearances of securing, supporting and locking devices are to be measured, where indicated in the OMM.

2.1.5 A close-up survey of securing, supporting and locking devices as listed below, including welding, is to be carried out:

- cylinder securing pins, supporting brackets, back-up brackets (where fitted) and their welded connections
- hinge pins, supporting brackets, back-up brackets (where fitted) and their welded connections
- locking hooks, securing pins, supporting brackets, back-up brackets (where fitted) and their welded connections
- locking pins, supporting brackets, back-up brackets (where fitted) and their welded connections
- locating and stopper devices and their welded connections.

**2.1.6** A close visual inspection of sealing arrangements (packing material, rubber gaskets, packing retaining bars or channels) is to be carried out. For the tightness hose test, refer to [2.1.8].

**2.1.7** The drainage arrangements including bilge wells, drain pipes and non-return valves are to be visually examined; confirmation that the provision of means to prevent blockage of drainage arrangements, for closed vehicle and ro-ro spaces and special category spaces where fixed pressure water-spraying systems are used, are satisfactory. A test of the bilge system between the inner and outer doors and that of the vehicle deck is to be carried out.

**2.1.8** Function tests are to be carried out as follows, according to the required and/or existing equipment on board:

- a) doors are to be examined during a complete opening and closing operation; during this operation, the proper working of hinging arms and hinges, proper engagement of the thrust bearings and proper working of devices for locking the door in open position are to be checked
- b) securing, supporting and locking devices are to be examined during a complete opening and closing operation; the following items are to be checked:
  - opening/closing system and securing/locking devices are interlocked in such a way that they can only operate in proper sequence
  - mechanical lock of the securing devices
  - the securing devices remain locked in the event of loss of hydraulic fluid, if they are of hydraulic type
- c) indicators of open/closed position of doors and of securing/locking devices at navigation bridge and other remote control stations are to be checked; other safety devices such as isolation of securing/locking hydraulic system from other hydraulic systems, access to operating panels, notice plates and warning indicator lights are to be checked
- d) a tightness hose test or equivalent of sealing arrangements is to be carried out
- e) a working test of the indicator system is to be carried out, including checking of:
  - visual indicators and audible alarms on the navigation bridge and operating panel
  - lamp test function, fail safe performance, power supply for indicator system
  - proper condition of sensors and their protection from water, ice formation and mechanical damage
  - confirmation that power supply for indicator system is supplied by the emergency source or other secure power supply and is independent of the power supply for operating the doors
- f) a working test of the water leakage detection system for inner doors and for the area between the bow door and the inner door (as applicable) is to be carried out and the proper function of audible alarms on the navigation bridge and the engine control room panel (as applicable) is to be ascertained
- g) the television surveillance system is to be verified with proper indication on the navigation bridge and engine control room monitors
- h) electrical equipment for opening, closing and securing the doors is to be examined.

**2.1.9** Non-destructive tests and/or thickness measurements may be required by the Surveyor after visual examination and function test or in cases where cracks or deformations have been found.

## **2.2 Internal platforms and ramps**

**2.2.1** The annual survey of internal movable platforms and ramps (excluding those considered as inner doors and covered in [2.1]) and related equipment consists of:

- a general examination of the installation, particular attention being paid to the condition of steel cables
- confirmation of the proper operation of platforms/ramps and of mechanical stops and locks
- checking, as far as practicable, of the alarms and safety devices.

## **2.3 Fire protection, detection and extinction**

**2.3.1** Within the scope of survey of fire protection, detection and extinction arrangements as required for the annual survey of all ships in Ch 3, Sec 1, [3.4], attention is to be given to the particular arrangements related to ro-ro cargo spaces, such as:

- fire detection systems and alarms
- fixed fire-extinguishing arrangements (gas, water-spraying or foam systems)
- means of control provided for closing various openings
- portable fire extinguishers in spaces and at entrances
- ventilation and related safety devices (including remote control on the bridge)
- electrical equipment of a safe type
- examination of the fire protection arrangements in cargo, vehicle and ro-ro spaces, including the fire safety arrangements for vehicle carriers carrying motor vehicles with compressed hydrogen or natural gas in their tanks for their own propulsion as cargo, as applicable, and
- examination and test of the portable gas detectors suitable for the detection of the gas fuel, for vehicle carriers carrying motor vehicles with compressed hydrogen or natural gas in their tanks for their own propulsion as cargo.

### **3 Ro-ro cargo ships and pure car and/or truck carriers - Class renewal survey**

#### **3.1 Shell and inner doors**

**3.1.1** The class renewal survey is to include, in addition to the requirements of the annual survey as required in [2], examination, tests and checks of sufficient extent to verify that the bow, inner, side shell and stern doors are in satisfactory condition and considered able to remain in compliance with the applicable requirements, subject to proper maintenance and operation in accordance with the Operation and Maintenance Manual (OMM) or the manufacturer's recommendations and the periodical surveys being carried out at the due dates for the five-year period until the next class renewal survey.

**3.1.2** The examinations of the doors are to be supplemented by thickness measurements and testing to verify compliance with the applicable requirements so that the structural and weathertight integrity remains effective. The aim of the examination is to identify corrosion, significant deformation, fractures, damages or other structural deterioration that may be present.

**3.1.3** A close visual inspection of structural arrangements is to be carried out, supplemented by non-destructive tests and/or thickness measurements, as deemed necessary by the Surveyor.

**3.1.4** A survey of the items listed in [2.1.4] and [2.1.5], including close-up survey of securing, supporting and locking devices, together with welding, is to be carried out.

Non-destructive testing and thickness measurements are to be carried out on securing, supporting and locking devices, including welding, to the extent considered necessary by the Surveyor. Whenever a crack is found, an examination with NDT is to be carried out in the surrounding area and for similar items, as considered necessary by the Surveyor.

**3.1.5** Clearances of hinges, bearings and thrust bearings are to be taken. Unless otherwise specified in the OMM or by the manufacturer's recommendation, the measurement of clearances on ro-ro cargo ships may be limited to representative bearings where dismantling is needed in order to measure the clearances.

If dismantling is carried out, a visual examination of hinge pins and bearings together with NDT of the hinge pins are to be carried out.

**3.1.6** Non-return valves of drainage arrangements are to be checked after dismantling.

**3.1.7** The maximum thickness diminution of hinging arms, securing, supporting and locking devices is to be treated according to the normal procedure for primary structures, but is not to be more than 15% of the as-built thickness or the maximum corrosion allowance of the Society, whichever is less. Certain designs may be subject to the Society's special consideration.

**3.1.8** Checking the effectiveness of sealing arrangements by hose testing or equivalent is to be carried out.

#### **3.2 Internal platforms and ramps**

**3.2.1** The condition of pulleys, axles, cables and structure of the platforms and ramps is to be checked.

Electric motors and/or hydraulically operated equipment are to be surveyed according to the scope detailed in Ch 3, Sec 3, [3] for the class renewal survey of machinery installations.

#### **3.3 Fire protection, detection and extinction**

**3.3.1** Within the scope of survey of fire protection, detection and extinction arrangements as required for the class renewal survey of all ships in Ch 3, Sec 3, [3.8], attention is to be given to the particular arrangements related to ro-ro cargo spaces, such as those indicated in [2.3.1].

### **4 Passenger ships - Annual survey**

#### **4.1 Watertight bulkheads**

**4.1.1** The survey of watertight bulkheads and arrangements consists of:

- examination, as far as practicable, of collision and watertight bulkheads, and confirmation that their watertight integrity has not been impaired
- checking the diagram provided on the navigation bridge showing the location of the watertight doors and related indicators for their open/closed position
- testing operation of local and remote control (from the navigation bridge) of the watertight doors, and in particular, operation from each side of the bulkhead of audible alarms or visual signals and control handles, as required or fitted
- confirmation of operation of watertight doors in the event of failure of main and emergency sources of power
- confirmation that notices are affixed at appropriate locations.

## 4.2 Openings in shell plating

4.2.1 The survey consists of:

- examination of the arrangements for closing sidescuttles and their deadlights, as well as scuppers, sanitary discharges and similar openings and other inlets and discharges in the shell plating below the bulkhead deck
- confirmation that valves for closing the main and auxiliary sea inlets and discharges in the machinery spaces are readily accessible, and that indicators showing the status of the valves are provided, as required or fitted
- confirmation that gangway access and cargo ports fitted below the bulkhead deck may be effectively closed and that the inboard ends of any ash or rubbish chutes are fitted with an effective cover.

## 4.3 Miscellaneous

4.3.1 It is to be verified that the emergency escape routes from passenger and crew spaces, including related stairways and ladders, are kept clear.

## 5 Passenger ships - Class renewal survey

### 5.1

5.1.1 A lightweight survey is to be carried out to verify any changes in lightship displacement and in the longitudinal position of the centre of gravity. Where, in comparison with the approved stability information, a deviation exceeding 2% in the lightship displacement or a deviation of the longitudinal centre of gravity exceeding 1% of the length between perpendiculars is found or anticipated, the ship is to be submitted to a new inclining test.

5.1.2 The condition of the Low Location Lighting (LLL) system, where fitted, and its power source(s) is to be verified.

## 6 Ro-ro passenger ships - Annual and class renewal surveys

### 6.1

6.1.1 The scope of the annual survey and class renewal survey of **ro-ro passenger ship** is to include the scope of surveys required for the service notations **ro-ro cargo ship** and **passenger ship**, as detailed in [2] and [4] for annual survey and in [3] and [5] for class renewal survey.

6.1.2 In addition to [6.1.1], for both annual survey and class renewal survey, the condition of means of escape as well as of fire protection, detection and extinction in special category spaces is to be checked.

# Section 7

## General Cargo Ships

### 1 General

#### 1.1 Application

**1.1.1** The requirements of this Section apply to all self-propelled ships which have been assigned the service notation **general cargo ship** or **bulk carrier** (without the **ESP** additional service feature) of 500 GT and above carrying solid cargoes other than dedicated wood chip carriers and dedicated cement carriers.

The requirements of this Section do not apply to general dry cargo ships of double side-skin construction, with double side-skin extending for the length of the cargo area, and over the height of the cargo hold to the upper deck.

Note 1: Special consideration may also be given to ships that are of double-skin construction but with single skin in way of several frame spaces, e.g. in way of a cargo hold entrance or in way of forebody hull form at the forward end of the foremost cargo hold.

In case of ships with hybrid cargo hold arrangements, e.g. with some cargo holds of single-side skin and others of double-side skin, the requirements of this Section are to be applied only to the structure in way of the single-side skin cargo hold region.

**1.1.2** The requirements apply to surveys of hull structure and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces and fuel oil tanks within the cargo area and all ballast tanks. They are additional to the requirements applicable to the remainder of the ship, given in Part A, Chapter 3 according to the relevant surveys.

**1.1.3** The requirements contain the minimum extent of examination, thickness measurements and tank testing.

When substantial corrosion, as defined in Ch 2, Sec 2, [2.2.7], and/or structural defects are found, the survey is to be extended and is to include additional close-up surveys when necessary.

**1.1.4** In any kind of survey, i.e. class renewal, intermediate, annual or other surveys having the same scope, thickness measurements, when required by Tab 5, of structures in areas where close-up surveys are required are to be carried out simultaneously with close-up surveys.

**1.1.5** Consideration may be given by the attending Surveyor to allow use of Remote Inspection Techniques (RIT) as an alternative to close-up survey, as defined in Ch 2, Sec 2. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor.

When RIT is used for a close-up survey, temporary means of access for the corresponding thickness measurements as specified in this section is to be provided unless such RIT is also able to carry out the required thickness measurements.

For surveys conducted by use of a remote inspection technique, one or more of the following means of access, acceptable to the Surveyor, is to be provided:

- unmanned robot arm
- remote operated vehicle (ROV)
- unmanned aerial vehicles/drones
- other means acceptable to the Society.

**1.1.6** When, in any survey, thickness measurements are required, the procedure detailed in Ch 2, Sec 2, [2.3] is to be applied.

Note 1: Special consideration or specially considered (in connection with close-up surveys and thickness measurements) means sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.

#### 1.2 Reporting and evaluation of surveys

**1.2.1** A hull condition evaluation report (summarising the results of the class renewal surveys) is issued by the Society to the Owner, who is to place it on board the ship for reference at future surveys. The hull condition evaluation report is endorsed by the Society.

Note 1: Note 1: This report does not apply to general dry cargo ships of double side-skin construction, with double side-skin extending over the entire length of the cargo area, and over the entire height of the cargo hold to the upper deck.

### 2 Annual survey

#### 2.1 General

**2.1.1** Suspect areas identified at previous surveys are to be examined. Thickness measurements are to be taken of the areas of substantial corrosion and the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion, as per the requirements of Tab 6. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

**2.1.2** For survey of air pipes, flame screens on vents and ventilators, refer to Ch 3, Sec 1, [2.1.1].

**2.1.3** For ships granted with the additional class notation **OPEN-HATCH**:

- confirmation that the operability and condition of the hold dewatering systems and freeing ports, if they are fitted, have been checked by the crew on a monthly basis and recorded in the ship's log book for annual verification by the Society
- examination of the water-spray system for open-top cargo holds in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.2], item d).

**2.2 Hatch covers and coamings**

**2.2.1** The annual survey of hatch covers is to be carried out according to the requirements of Ch 3, Sec 1, [2.3].

In addition to these requirements, a close-up survey of hatch cover and hatch coaming plating and its stiffeners is to be carried out.

**2.3 Cargo holds**

**2.3.1** The requirements given in Tab 1 are to be complied with.

**Table 1 : Annual survey of cargo holds for general cargo ships**

Age of ship (in years at time of annual survey)	
10 < age ≤ 15	age > 15
Overall survey of one forward and one after cargo hold and their associated 'tweendeck spaces  See (2)	Overall survey of all cargo holds and 'tweendeck spaces  Close-up survey of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approximately the lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in a forward lower cargo hold and one other selected lower cargo hold  Examination of all piping and penetrations, including overboard piping, in all cargo holds  See (1), (2) and (3)
<p>(1) Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all the shell frames and adjacent shell plating of those cargo holds and associated 'tweendeck spaces (as applicable) as well as a close-up survey of sufficient extent of all remaining cargo holds and 'tweendeck spaces (as applicable).</p> <p>(2) When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion, in accordance with Tab 6. These extended thickness measurements are to be carried out before the annual survey is credited as completed.</p> <p>(3) Where protective coating in cargo holds, as applicable, is found in good condition, the extent of close-up survey may be specially considered.</p>	

**2.4 Ballast tanks**

**2.4.1** Ballast tanks are to be internally examined when required as a consequence of the results of the class renewal survey or the intermediate survey; see [4.2.7] and footnote (3) of Tab 3.

**2.4.2** When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements are to be increased to determine the extent of areas of substantial corrosion, in accordance with Tab 6. These extended thickness measurements are to be carried out before the annual survey is credited as completed.

**3 Intermediate survey**

**3.1 General**

**3.1.1** A survey planning meeting is to be held prior to the commencement of the survey.

**3.2 Ships 15 years of age or less**

**3.2.1** The requirements for survey of cargo holds given in Tab 2 are to be complied with.

**3.2.2** The requirements for survey of ballast tanks given in Tab 3 are to be complied with.

**Table 2 : Intermediate survey of cargo holds for general cargo ships**

Age of ship (in years at time of intermediate survey)	
5 < age ≤ 10	10 < age ≤ 15
Overall survey of one forward and one after cargo hold and their associated 'tweendeck spaces Areas found suspect at the previous surveys are to be surveyed in accordance with the provisions indicated in [2.1.1]	Overall survey of all cargo holds and 'tweendeck spaces Areas found suspect at the previous surveys are to be surveyed in accordance with the provisions indicated in [2.1.1] See (1)
(1) When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion, in accordance with Tab 6. These extended thickness measurement are to be carried out before the survey is credited as completed.	

**Table 3 : Intermediate survey of ballast tanks for general cargo ships**

Age of ship (in years at time of intermediate survey)	
5 < age ≤ 10	10 < age ≤ 15
Overall survey of representative ballast tanks selected by the Surveyor See (1), (2) and (3)	Overall survey of all ballast tanks See (1) and (3)
Areas found suspect at the previous surveys are to be surveyed in accordance with the provisions indicated in [2.1.1]	Areas found suspect at the previous surveys are to be surveyed in accordance with the provisions indicated in [2.1.1]
(1) If such overall survey reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient. (2) Where poor coating condition, soft or semi-hard coating, corrosion or other defects are found in ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type. (3) In ballast tanks other than double bottom tanks, where a hard protective coating is found in poor condition and it is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from time of construction, the tanks in question are to be examined and thickness measurements carried out as considered necessary at annual surveys. When such breakdown of hard protective coating is found in double bottom ballast tanks, where a soft or semi-hard coating has been applied or where a hard protective coating has not been applied, the tanks in question may be examined at annual surveys. When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurements are to be carried out.	

### 3.3 Ships over 15 years of age

**3.3.1** The scope of the intermediate survey of ships over 15 years of age is the scope of the preceding class renewal survey of hull, as detailed in [4], except for thickness measurements of each bottom plate within the cargo length area, and with bottom survey in dry condition or bottom in water-survey as applicable.

However, tank testing specified in [4.6], survey of automatic air pipe heads and internal examination of fuel oil, lube oil and fresh water tanks are not required unless deemed necessary by the attending surveyor.

This intermediate survey may be commenced at the second annual survey of the class period and be progressed during the succeeding year with a view to completion at the third annual survey.

## 4 Class renewal survey

### 4.1 Preparation for survey

**4.1.1** The Owner is to provide the necessary facilities for a safe and practical execution of the surveys, including the means of providing access to structures for close-up survey, thickness measurements and tank testing. All other provisions described in Ch 2, Sec 2, [2.3], Ch 2, Sec 2, [2.5], Ch 2, Sec 2, [2.6], Ch 2, Sec 2, [2.7] and Ch 2, Sec 2, [2.9] regarding procedures for thickness measurements, conditions for survey, access to structures, equipment for survey and survey at sea or at anchorage, respectively, are also to be complied with.

### 4.2 Scope of survey

**4.2.1** A survey planning meeting is to be held prior to the commencement of the survey.

**4.2.2** In addition to the requirements of annual surveys, the class renewal survey is to include examination, tests and checks of sufficient extent to ensure that the hull and related piping, as required in [4.2.4] are in satisfactory condition and fit for the intended purpose for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

**4.2.3** All cargo holds, ballast tanks, including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this examination is to be supplemented by thickness measurement and testing as required in [4.5] and [4.6] to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deformation, that may be present.

**4.2.4** All piping systems within the above spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

**4.2.5** The survey extent of ballast tanks converted to void spaces is to be specially considered by the Society in relation to the requirements for ballast tanks.

Note 1: For survey of automatic air pipe heads, refer to Ch 3, Sec 3, Tab 1.

**4.2.6** As indicated in Ch 3, Sec 3, [2.1.1], a bottom survey in dry condition is to be a part of the class renewal survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks are to be carried out in accordance with the applicable requirements for class renewal surveys, if not already performed.

Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line.

**4.2.7** Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined.

For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in poor condition and it is not renewed, where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as found necessary by the Surveyor.

When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

**4.2.8** Where the hard protective coating in tanks is found to be in good condition, the extent of close-up surveys and thickness measurements may be specially considered.

**4.2.9** For ships granted with the additional class notation **OPEN-HATCH**:

- examination and complete test of the hold dewatering systems to check their proper functioning
- complete inspection of the open cargo holds
- operational testing and internal examination, as required by the Surveyor, of the relevant pumps for the water-spray system for open-top cargo holds.

### **4.3 Hatch covers and coamings**

**4.3.1** The requirements listed in Ch 3, Sec 3, [2.2.2] for all ships are to be complied with.

**4.3.2** In addition to [4.3.1], the close-up survey and thickness measurements in accordance with the requirements given in Tab 4 and Tab 5, respectively, are to be carried out.

Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/ thickness measurement is to be done of the accessible parts of hatch cover structures.

### **4.4 Overall and close-up surveys**

**4.4.1** An overall survey of all cargo holds, tanks and spaces is to be carried out at each class renewal survey. However, for fuel oil, lube oil and fresh water tanks, the requirements given in Ch 3, Sec 3, Tab 2 are to be complied with.

**4.4.2** The minimum requirements for close-up surveys at class renewal survey are given in Tab 4.

The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

For areas in spaces where hard protective coatings are found to be in a good condition, the extent of close-up surveys according to Tab 4 may be specially considered.

Note 1: For survey of automatic air pipe heads, reference is to be made to Ch 3, Sec 3, Tab 1.

### **4.5 Thickness measurements**

**4.5.1** The minimum requirements for thickness measurements at class renewal survey are given in Tab 5.

**4.5.2** The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion in accordance with the requirements given in Tab 6.

**4.5.3** For areas in spaces where hard protective coatings are found to be in a good condition, the extent of thickness measurements according to Tab 5 may be specially considered.

**Table 4 : Requirements for close-up survey at class renewal survey of general cargo ships**

Age of ship (in years at time of class renewal survey)			
Class renewal survey No.1 age ≤ 5	Class renewal survey No.2 5 < age ≤ 10	Class renewal survey No.3 10 < age ≤ 15	Class renewal survey No.4 and subsequent age > 15
Selected shell frames in one forward and one aft cargo hold and associated 'tweendeck spaces ①	Selected shell frames in all cargo holds and 'tweendeck spaces ①	All shell frames in the forward lower cargo hold and 25% of shell frames in each of the remaining cargo holds and 'tweendeck spaces including upper and lower end attachments and adjacent shell plating ①	All shell frames in all cargo holds and 'tweendeck spaces including upper and lower end attachments and adjacent shell plating ①
One selected cargo hold transverse bulkhead ②	One transverse bulkhead in each cargo hold ② Forward and aft transverse bulkheads in one side ballast tank, including stiffening system ②	All cargo hold transverse bulkheads ② All transverse bulkheads in ballast tanks, including stiffening system ②	Areas ② to ⑥ as for class renewal survey for ships between 10 and 15 years of age
	One transverse web with associated plating and framing in two representative ballast tanks of each type (i.e. topside, hopper side, side tank or double bottom tank) ③	All transverse webs with associated plating and framing in each ballast tank ③	
All cargo hold hatch covers and coamings (plating and stiffeners) ④	All cargo hold hatch covers and coamings (plating and stiffeners) ④	All cargo hold hatch covers and coamings (plating and stiffeners) ④	
	Selected areas of all deck plating and underdeck structure inside line of hatch openings between cargo hold hatches ⑤	All deck plating and underdeck structure inside line of hatch openings between cargo hold hatches ⑤	
	Selected areas of inner bottom plating ⑥	All areas of inner bottom plating ⑥	

**Note 1:** See Fig 1, Fig 2, Fig 3 and Fig 4 for areas ①, ②, ③, ④, ⑤ and ⑥.

- ① Cargo hold transverse frames.
- ② Cargo hold transverse bulkhead plating, stiffeners and girders.
- ③ Transverse web frame or watertight transverse bulkhead in ballast tanks.
- ④ Cargo hold hatch covers and coamings. Subject to cargo hold hatch covers of approved design which structurally have no access to the internals, close-up survey/thickness measurement is to be done of the accessible parts of hatch cover structures.
- ⑤ Deck plating and underdeck structure inside line of hatch openings between cargo hold hatches.
- ⑥ Inner bottom plating.

**Note 2:** Close-up survey of cargo hold transverse bulkheads to be carried out at the following levels:

- immediately above the inner bottom and immediately above the 'tweendecks, as applicable
- mid-height of the bulkheads for holds without 'tweendecks
- immediately below the main deck plating and 'tweendeck plating.

Figure 1 : Areas subject to close-up surveys and thickness measurements of general cargo ships

	One transverse section of deck plating in way of a cargo space within the amidships 0,5 L <b>(1)</b>	Two transverse sections within the amidships 0,5 L in way of two different cargo spaces <b>(1)</b>  Within the cargo length area, each deck plate outside line of cargo hatch openings	Within the cargo length area: <ul style="list-style-type: none"> <li>• a minimum of three transverse sections within the amidships 0,5 L <b>(1)</b></li> <li>• each deck plate outside line of cargo hatch openings</li> <li>• each bottom plate, including lower turn of bilge</li> <li>• duct keel or pipe tunnel plating and internals</li> </ul>
	Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 4	Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 4	Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to close-up survey according to Tab 4
		All wind and water strakes within the cargo area	All wind and water strakes full length
		Selected wind and water strakes outside the cargo area	
<p><b>(1)</b> Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.</p> <p><b>Note 1:</b> Thickness measurement locations should be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.</p> <p><b>Note 2:</b> For ships less than 100 metres in length, the number of transverse sections required for ships between 10 and 15 years of age may be reduced to one and the number of transverse sections for ships over 15 years of age may be reduced to two.</p>			

**Table 6 : Requirements for extent of thickness measurements at those areas of substantial corrosion  
Class renewal survey of general cargo ships**

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect area and adjacent plates	5-point pattern over 1 m <sup>2</sup> of plating
Stiffeners	Suspect area	3 measurements each in line across web and flange

## 4.6 Tank testing

**4.6.1** All boundaries of ballast tanks and deep tanks used for water ballast within the cargo length area are to be pressure tested. For fuel oil tanks, the representative tanks are to be pressure tested.

**4.6.2** The Surveyor may extend the tank testing as deemed necessary.

**4.6.3** Tank testing of fuel oil tanks is to be carried out with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil tanks may be specially considered based on a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results.

# Section 8 Other Service Notations

## 1 General

### 1.1

1.1.1 The requirements of this Section are applicable to ships to be assigned one of the following service notations, and given in the Articles specified below:

- **container ship**, or ship **equipped for the carriage of containers**, in Article [2]
- **livestock carrier**, in Article [3]
- **FLS tanker**, in Article [4]
- dredging units, i.e. ships with the service notations **dredger**, **hopper dredger**, **hopper unit**, **split hopper unit**, **split hopper dredger**, in Article [5]
- **tug**, **salvage tug**, **escort tug**, in Article [6]
- **supply**, in Article [7]
- **fire-fighting**, in Article [8]
- **oil recovery**, in Article [9]
- **anchor handling**, in Article [10]
- **cable laying**, in Article [11]
- **lifting**, in Article [12]
- diving support, i.e. **diving support-integrated** or **diving support-portable**, in Article [13]
- **fishing vessel**, in Article [14]
- **standby rescue**, in Article [15]
- **yacht** and **charter yacht**, in Article [16].
- **semi-submersible cargo ship**, in Article [17].
- **diving systems**, in Article [18]
- **pipe laying**, in Article [19].

1.1.2 These requirements are additional to those given in Part A, Chapter 3, according to the relevant surveys.

1.1.3 The requirements for survey of diving systems assigned with one of the following notations are given in Article [18]:

- **diving system-integrated**
- **diving system-portable**
- **hyperbaric reception facility**.

## 2 Container ship or ship equipped for the carriage of containers

### 2.1 Annual survey

2.1.1 The survey is to include:

- confirmation of the availability of instructions and instruments for stowage of containers, as required or fitted
- examination of container supports welded to the ship's structure or on to the hatch covers
- examination of cell guides, if fitted.

### 2.2 Class renewal survey

2.2.1 The renewal is to include:

- examination of container supports welded to the ship's structure or on to the hatch covers, checking for possible cracks and deformations
- examination of cell guides and associated elements, checking for possible cracks, deformations or corrosion.

2.2.2 For ships assigned with the service notation **container ship**, examination of the torsion box girder or equivalent structure at the top sides is carried out. Thickness measurements additional to those related to the transverse sections may be required.

### **3 Livestock carrier**

#### **3.1 Annual survey**

**3.1.1** The survey is to include a general examination of:

- spaces for the livestock and related hatch covers (to be surveyed according to Ch 3, Sec 1, [2])
- ventilation means, including prime movers
- main, emergency and portable lighting systems in livestock spaces, passageways and access routes
- the drainage system
- fodder and fresh water systems
- fire-fighting appliances, with working test as far as necessary and practicable (according to Ch 3, Sec 1, [3.4])
- means of escape, with confirmation they are kept clear.

#### **3.2 Class renewal survey**

**3.2.1** The equipment related to ventilation, lighting and the related power supply is to be submitted to a survey to the same extent as required for similar equipment at the class renewal survey as indicated in Ch 3, Sec 3.

**3.2.2** The drainage, fodder and fresh water systems, including piping and pumps, are to be surveyed to the same extent as required for similar equipment at the class renewal survey as indicated in Ch 3, Sec 3.

The fresh water tanks are to be internally examined in accordance with the periodicity given in Ch 3, Sec 3, Tab 2.

**3.2.3** The fire-fighting systems are to be thoroughly examined and tested.

### **4 FLS tanker**

#### **4.1 Annual survey - Hull items**

##### **4.1.1 Weather decks**

The survey is to include:

- examination of cargo tank openings, including gaskets, covers, coamings and screens
- examination of cargo tank pressure/vacuum valves and flame screens
- examination of flame screens on vents to all bunker, oily ballast and oily slop tanks
- examination of cargo, bunker, ballast and vent piping systems, including remote control valves, safety valves and various safety devices, as well as vent masts and headers
- confirmation that wheelhouse doors and windows, sidescuttles and windows in superstructure and deckhouse ends facing the cargo area are in satisfactory condition
- confirmation that pumps, valves and pipelines are identified and distinctively marked.

##### **4.1.2 Cargo pump rooms and pipe tunnels**

The survey is to include:

- examination of all pump room bulkheads and pipe tunnels (if any) for signs of chemical cargo leakage or fractures and, in particular, the sealing arrangements of penetrations in pump room bulkheads
- examination of the condition of all piping systems, in cargo pump rooms and pipe tunnels (if any)
- examination of the bilge and ballast arrangements and confirmation that pumps and pipelines are identified.

#### **4.2 Annual survey - Cargo machinery items**

##### **4.2.1 Cargo area and cargo pump rooms**

The Owner or his representative is to declare to the attending Surveyor that no modifications or alterations which might impair safety have been made to the various installations in dangerous zones without prior approval from the Society.

The survey is to include:

- confirmation that potential sources of ignition in or near the cargo pump rooms, such as loose gear, excessive product in bilge, excessive vapours, combustible materials, are eliminated and that access ladders are in satisfactory condition
- examination, as far as practicable, of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of pump room bilge system, and checking that pump foundations are intact
- confirmation that the ventilation system, including portable equipment, if any, of all spaces in the cargo area (including cargo pump room) is operational, ducting is intact, dampers are operational and screens are clean
- confirmation that electrical equipment in dangerous zones, cargo pump rooms and other spaces is in satisfactory condition and has been properly maintained

- confirmation that the remote operation of the cargo pump room bilge system is satisfactory
- examination of the cargo heating system
- examination of the cargo-transfer arrangement and confirmation that the ship's cargo hoses are suitable for their intended purpose and in satisfactory condition
- confirmation that any special arrangement made for bow or stern loading/unloading is in satisfactory condition.

#### **4.2.2 Instrumentation and safety devices**

The survey is to include the following items, as far as required or fitted:

- examination of cargo tank gauging devices, high level alarms and valves associated with overflow control
- confirmation that installed pressure gauges on cargo discharge lines are properly operational
- confirmation that the required gas detection instruments are on board and satisfactory arrangements have been made for the supply of any required vapour detection tubes
- confirmation that devices provided for measuring the temperature of the cargo, if any, operate satisfactorily.

#### **4.2.3 Fire-fighting systems**

The survey is to include:

- external examination of piping and cut-out valves of fixed fire-fighting systems related to cargo tanks and cargo pump rooms
- confirmation, as far as practicable and when appropriate, that the remote means for closing the various openings are operable
- examination of the appropriate portable fire-extinguishing equipment for the chemical cargoes to be carried in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.3]
- examination of fire-fighting systems of any type fitted on board such as deck foam, water-spraying, etc. as applicable in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.2].

#### **4.2.4 Inert gas system**

If an inert gas system such as that installed on board oil tankers is fitted, the requirements given in Ch 4, Sec 3, [3.4] are to be complied with.

### **4.3 Intermediate survey - Hull items**

**4.3.1** The survey is to include:

- examination, as far as applicable, of cargo, stripping, cargo washing, bunker, ballast, steam and vent piping systems as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, pressure testing, thickness measurement or both may be required
- confirmation, if applicable, that cargo pipes are electrically bonded to the hull
- examination of vent line drainage arrangements.

### **4.4 Intermediate survey - Cargo machinery items**

#### **4.4.1 Electrical equipment in dangerous zones**

A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

The electrical insulation resistance of the electrical equipment and circuits terminating in or passing through the dangerous zones is to be tested; however, in cases where a proper record of testing is maintained, consideration may be given to accepting recent test readings effected by the ship's personnel.

#### **4.4.2 Cargo heating system**

The satisfactory condition of the cargo heating system is to be verified.

#### **4.4.3 Inert gas system**

For ships over 10 years old at the time of the intermediate survey due date, if an inert gas system such as that installed on board oil tankers is fitted, the requirements given in Ch 4, Sec 3, [5.2] for intermediate survey of oil tankers are to be complied with.

### **4.5 Class renewal survey - Hull items**

#### **4.5.1 Piping**

Piping for cargo, ballast, stripping and venting systems is to be examined to the Surveyor's satisfaction. Dismantling and/or thickness measurements of these items may be required. A hydraulic test is to be carried out in the event of repair or dismantling of cargo or ballast piping, or where doubts arise.

Vent line drainage arrangements are to be examined.

It is to be verified, when applicable, that cargo piping is electrically bonded to the hull.

#### **4.5.2 Safety valves**

All safety valves on cargo piping and of cargo tanks are to be dismantled for examination, adjusted and, as applicable, resealed.

#### **4.5.3 Cargo pump rooms**

All cargo pump room boundaries are to be generally examined. All gas-tight shaft sealing devices are to be examined. The bottom of cargo pump rooms is to be presented clean for the examination of stripping devices and gutters.

### **4.6 Class renewal survey - Cargo machinery items**

#### **4.6.1 Pumps**

Ballast and stripping pumps are to be internally examined and prime movers checked. A working test is to be carried out.

Maintenance records of cargo pumps are to be made available to the Surveyor.

#### **4.6.2 Washing system**

Where a washing system is fitted, piping, pumps, valves and deck-mounted washing machines are to be examined and tested for signs of leakage, and anchoring devices of deck-mounted washing machines are to be checked to the Surveyor's satisfaction.

#### **4.6.3 Cargo heating system**

The apparent satisfactory condition of the cargo heating system such as clamping, external condition of piping is to be verified and, if deemed necessary by the Surveyor, the system is to be pressure tested.

#### **4.6.4 Remote controls**

An operating test of the emergency remote control of pumps and valves and of automatic closing valves is to be carried out.

#### **4.6.5 Electrical equipment in dangerous zones**

A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

The electrical insulation resistance of the electrical equipment and circuits terminating in or passing through the dangerous zones is to be tested; however, in cases where a proper record of testing is maintained, consideration may be given to accepting recent test readings effected by the ship's personnel.

#### **4.6.6 Fire-fighting systems**

The survey is to include the examination of fire-fighting systems of any type fitted on board for the protection of the cargo area, cargo pump room and other dangerous spaces, such as deck foam, water-spraying, etc., as applicable in accordance with the relevant requirements given in Ch 3, Sec 3, [3.8].

#### **4.6.7 Inert gas system**

If an inert gas system such as that installed on board oil tankers is fitted, the requirements given in Ch 4, Sec 3, [5.2] for intermediate survey and in Ch 4, Sec 3, [7.3] for class renewal survey of oil tankers are to be complied with.

## **5 Dredging units**

### **5.1 Annual survey**

**5.1.1** The survey is to include the following items, as far as required or fitted, according to the service notation of the ship:

- for **split hopper unit, split hopper dredger**, visual examination, as far as practicable, of superstructure hinges and blocks, deck hinges, hydraulic jacks and associated piping systems and alarms
- for **dredger, hopper dredger, split hopper dredger**:
  - visual examination, as far as practicable, of attachments of suction piping and lifting systems to the structure and external examination of piping in dredging machinery spaces for absence of corrosion and leakage
  - checking the condition of the dredging machinery space and related equipment with regard to electrical shocks, protection from rotating machinery, fire and explosion hazards.

### **5.2 Class renewal survey**

**5.2.1** The survey is to include the following items, as far as required or fitted, according to the service notation of the ship:

- for **hopper dredger, hopper unit**, visual examination of hopper bottom doors or valves and accessories, such as hinges, actuating rods, hydraulic systems, with dismantling as deemed necessary by the Surveyor
- for **split hopper unit, split hopper dredger**, visual examination, as far as practicable, of superstructure hinges and blocks, deck hinges, hydraulic jacks and associated piping systems and alarms, with dismantling and/or further checks as deemed necessary by the Surveyor

- for **dredger, hopper dredger, split hopper dredger**:
  - visual examination, as far as practicable, of attachments of suction piping and lifting systems to the structure and external examination of piping in dredging machinery spaces for absence of corrosion and leakage
  - checking the condition of the dredging machinery space and related equipment with regard to electrical shocks, protection from rotating machinery, fire and explosion hazards.

## **6 Tug, salvage tug, escort tug**

### **6.1 Annual survey**

- 6.1.1** The survey is to include a general external examination of the towing hook or towing winch, as fitted, and unhooking device, as far as practicable.
- 6.1.2** In addition to [6.1.1], for **salvage tug**, the availability and satisfactory condition of specific equipment as required in Pt E, Ch 1, Sec 3, [4] is to be verified.
- 6.1.3** For **tug-barge combined**, an examination of the accessible parts of the connection system is to be carried out.
- 6.1.4** For tugs fitted with towing winch emergency release systems subject to Pt E, Ch 1, Sec 3, [2.7.4], the annual survey is to include:
- confirmation of the operation of the towing winch emergency release system with the reference to the documented instructions for surveys provided by the manufacturer. Operation of the winch emergency release system under no load condition is to be verified. Where practical, activation of the emergency release system may be confirmed by observation of the winch brake
  - verification of the function of the alarms associated with the emergency release system, as far as practicable and reasonable
  - visual examination of the condition of the emergency release system to confirm it remains in satisfactory condition
  - examination of the means of emergency release of the towline in the event of a blackout, and where additional sources of energy are arranged for this purpose, visual inspection and operational test of the sources of energy
  - verification that the performance capabilities and operating instructions of the emergency release system are documented and made available on board the ship on which the winch has been installed.

### **6.2 Class renewal survey**

- 6.2.1** The survey is to include:
- checking the condition of the connection of the towing hook or towing winch to the structure, including related reinforcements of the structure
  - checking the external condition of the towing hook or towing winch; when applicable, a no-load test of the unhooking device is to be carried out.
- 6.2.2** In addition to [6.2.1], for **salvage tug**, the survey is to include:
- a check and working test of specific equipment as required in Pt E, Ch 1, Sec 3, [4]
  - checking by a specialist of the satisfactory condition of the towing line(s). A report is to be presented to the Surveyor by the Owner and kept on board.
- 6.2.3** For **tug-barge combined**, a visual examination of components of the connection system is to be carried out, completed by thickness measurements and non-destructive tests as deemed necessary by the Surveyor. A connection/disconnection test is to be carried out, including a check of related remote control, safety and alarm devices.
- 6.2.4** For ships granted with the additional service feature **standardized design bollard pull =  $[T_{BP}/9,81] t$** , the survey is to include a new bollard pull test as defined in Pt E, Ch 1, App 1, [9].
- 6.2.5** For tugs fitted with towing winch emergency release systems subject to Pt E, Ch 1, Sec 3, [2.7.4], the annual survey requirements are to be carried out, with the additional instructions for the class renewal survey provided by the manufacturer, as appropriate, being followed.

The full functionality of the emergency release system is to be tested to the satisfaction of the surveyor. Testing may be conducted either during a bollard pull test or by applying the load against a strong point on the deck of the tug or the shore that is certified to the appropriate load.

The emergency release system is to be tested at a towline load that is equal to the lesser of 30% of the maximum design load or 80% of vessel bollard pull in both a normal power condition and power blackout condition to the satisfaction of the surveyor.

## 7 Supply vessel

### 7.1 General

**7.1.1** The additional survey items for annual survey, intermediate survey and class renewal survey are applicable only to ships having the service notation **supply** assigned the additional service features **HNLS** or **WELLSTIM**.

### 7.2 Annual survey - Hull items

#### 7.2.1 Weather decks

The survey is to include:

- examination of cargo tank openings, including gaskets, covers, coamings and screens
- examination of cargo tank pressure/vacuum valves and flame screens
- examination of flame screens on vents to all bunker, oily ballast and oily slop tanks
- examination of cargo, bunker, ballast and vent piping systems, including remote control valves, safety valves and various safety devices, as well as vent masts and headers
- confirmation that wheelhouse doors and windows, sidescuttles and windows in superstructure and deckhouse ends facing the cargo area are in satisfactory condition
- confirmation that pumps, valves and pipelines are identified and distinctively marked.

#### 7.2.2 Cargo pump rooms and pipe tunnels

The survey is to include:

- examination of all pump room bulkheads and pipe tunnels (if any) for signs of oil or chemical product leakage or fractures and, in particular, the sealing arrangements of penetrations in pump room bulkheads
- examination of the condition of all piping systems, in cargo pump rooms and pipe tunnels (if any)
- examination of the bilge and ballast arrangements and confirmation that pumps and pipelines are identified.

### 7.3 Annual survey - Cargo machinery items

#### 7.3.1 Cargo area and cargo pump rooms

The Owner or his representative is to declare to the attending Surveyor that no modifications or alterations which might impair safety have been made to the various installations in dangerous zones without prior approval from the Society.

The survey is to include:

- confirmation that potential sources of ignition in or near the cargo pump rooms, such as loose gear, excessive product in bilge, excessive vapours, combustible materials, etc., are eliminated and that access ladders are in satisfactory condition
- examination, as far as practicable, of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of pump room bilge system, and checking that pump foundations are intact
- confirmation that the ventilation system, including portable equipment, if any, of all spaces in the cargo area (including cargo pump rooms) is operational, ducting is intact, dampers are operational and screens are clean
- confirmation that electrical equipment in dangerous zones, cargo pump rooms and other spaces is in satisfactory condition and has been properly maintained
- confirmation that the remote operation of the cargo pump room bilge system, if fitted, is satisfactory
- examination of the cargo heating system
- examination of the cargo-transfer arrangement and confirmation that the ship's cargo hoses are suitable for their intended purpose and in satisfactory condition.

#### 7.3.2 Instrumentation and safety devices

The survey is to include the following items, as far as required or fitted:

- examination of cargo tank gauging devices, high level alarms and valves associated with overflow control
- confirmation that installed pressure gauges on cargo discharge lines are properly operational
- confirmation that the required gas detection instruments are on board and satisfactory arrangements have been made for the supply of any required vapour detection tubes
- confirmation that devices provided for measuring the temperature of the cargo, if any, operate satisfactorily.

#### 7.3.3 Fire-fighting systems

The survey is to include:

- external examination of piping and cut-out valves of fixed fire-fighting systems related to cargo tanks and cargo pump rooms
- confirmation, as far as practicable and when appropriate, that the remote means for closing the various openings are operable
- examination of the appropriate portable fire-extinguishing equipment for the cargoes to be carried in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.3]

- examination of fire-fighting systems of any type fitted on board such as deck foam, water-spraying etc. as applicable in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.2].

#### **7.4 Intermediate survey - Hull items**

**7.4.1** The survey is to include:

- examination, as far as applicable, of cargo, stripping, bunker, ballast, steam and vent piping systems as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, pressure testing, thickness measurement or both may be required
- confirmation that the pipelines are electrically bonded to the hull
- examination of vent line drainage arrangements.

#### **7.5 Intermediate survey - Cargo machinery items**

##### **7.5.1 Electrical equipment in dangerous zones**

A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

The electrical insulation resistance of the electrical equipment and circuits terminating in or passing through the dangerous zones is to be tested; however, in cases where a proper record of testing is maintained, consideration may be given to accepting recent test readings effected by the ship's personnel.

##### **7.5.2 Cargo heating system**

The satisfactory condition of the cargo heating system is to be verified.

#### **7.6 Class renewal survey - Hull items**

##### **7.6.1 Piping**

Piping for cargo, ballast, stripping and venting systems is to be examined to the Surveyor's satisfaction. Dismantling and/or thickness measurements of these items may be required. A hydraulic test is to be carried out in the event of repair or dismantling of cargo or ballast piping, or where doubts arise.

Vent line drainage arrangements are to be examined.

It is to be verified that cargo piping is electrically bonded to the hull.

##### **7.6.2 Safety valves**

All safety valves on cargo piping and of cargo tanks are to be dismantled for examination, adjusted and, as applicable, resealed.

##### **7.6.3 Cargo pump rooms**

All cargo pump room boundaries are to be generally examined. All gas-tight shaft sealing devices are to be examined. The bottom of cargo pump rooms is to be presented clean for the examination of stripping devices and gutters.

##### **7.6.4 Tank testing**

Confirmation that cargo tank boundaries adjacent to machinery spaces, propeller shaft tunnels, if fitted, dry cargo spaces, accommodation and service spaces have been pressure tested.

If deemed necessary by the Surveyor, the tank testing may be extended.

#### **7.7 Class renewal survey - Cargo machinery items**

##### **7.7.1 Pumps**

Ballast and stripping pumps are to be internally examined and prime movers checked. A working test is to be carried out.

Maintenance records of cargo pumps are to be made available to the Surveyor.

##### **7.7.2 Cargo heating system**

The apparent satisfactory condition of the cargo heating system such as clamping, external condition of piping is to be verified and, if deemed necessary by the Surveyor, the system is to be pressure tested.

##### **7.7.3 Remote controls**

An operating test of the emergency remote control of pumps and valves and of automatic closing valves is to be carried out.

##### **7.7.4 Electrical equipment in dangerous zones**

A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

The electrical insulation resistance of the electrical equipment and circuits terminating in or passing through the dangerous zones is to be tested; however, in cases where a proper record of testing is maintained, consideration may be given to accepting recent test readings effected by the ship's personnel.

#### **7.7.5 Fire-fighting systems**

The survey is to include the examination of fire-fighting systems of any type fitted on board for the protection of the cargo area, cargo pump room and other dangerous spaces, such as deck foam, water-spraying, dry powder systems etc., as applicable in accordance with the relevant requirements given in Ch 3, Sec 3, [3.8].

## **8 Fire-fighting ship**

### **8.1 Annual survey**

#### **8.1.1 Ship's fire protection**

The survey is to include:

- general examination of arrangements for structural fire protection
- ships equipped with a self-protection water-spraying system: general examination of all parts, as far as practicable and visible, of self-protection water-spraying system, and of scuppers and freeing ports for water drainage from deck surfaces
- ships not equipped with a self-protection water-spraying system: general examination of steel deadlights and shutters.

#### **8.1.2 Water monitor system**

The survey is to include:

- general examination of all parts of the water monitor system (pumps, piping system, valves and other fittings)
- checking for proper operation of the system, including local manual control
- general examination of foundations of water monitors and check of local manual control.

#### **8.1.3 Fixed and portable foam systems**

The survey is to include:

- general examination of the systems
- confirmation that the foam concentrates are periodically tested, either by the Manufacturer or by an organisation agreed by him
- general examination of foundations of foam monitors and check of local manual control
- for fixed foam systems, reference is to be made to Ch 3, Sec 1, [3.4.2], item e).

#### **8.1.4 Machinery installations, control room and other devices**

The survey is to include:

- general examination of spaces containing auxiliary machinery for fire-fighting systems, particular attention being paid to arrangements, piping systems and instruments; check of tools and of pressure vessels and their fittings, if any
- general examination of the control station and check of all communication and remote control means, of ventilation system
- general examination of sea suction of fire-fighting systems, of relevant remote and local control and of piping systems, including the relevant protection against corrosion
- general external examination of electrical installations for fire-fighting systems, with particular regard to the alarms and searchlights,
- checking of other fire-fighting arrangements
- checking of fire-fighter's outfits, confirmation that they are stored in the appropriate locations, and checking of air compressor and other equipment.

### **8.2 Class renewal survey**

**8.2.1** The survey is to include:

- complete test of water fire-extinguishing systems, including the internal examination, as required by the Surveyor, of the relevant pumps
- partial test, at the Surveyor's discretion, of fixed foam fire-extinguishing systems
- test of self-protection fixed water-spraying systems, putting into operation the spray nozzles, including the internal examination, as required by the Surveyor, of the relevant pumps
- examination and test of prime movers of machinery relevant to fire-fighting systems and of the air compressor for refilling of air bottles of breathing apparatuses
- examination and test of the electrical generating plant supplying power to fire-fighting systems and searchlights
- test of searchlights.

## 9 Oil recovery ship

### 9.1 Annual survey

9.1.1 The survey is to include:

- confirmation of the availability of the operating manual
- examination of cargo tank openings, including gaskets, covers, coamings and screens
- general examination of cargo, ballast and vent piping systems, including control, gauging, alarm and safety devices
- general examination of the cargo pump room, as regards ventilation systems, fire protection, detection and fire-fighting systems, condition of pumps and piping systems, and signs of any oil leakage
- confirmation that electrical equipment in dangerous areas, cargo pump rooms and other spaces, if fitted, is in satisfactory condition; the Owner or his representative is to declare to the attending Surveyor that this equipment has been properly maintained
- general examination of the dry powder fire extinguishers, as well as, if fitted, of the fixed or semi-fixed foam extinguishing system; the Owner is to show evidence that the foam concentrates have been periodically tested, either by the manufacturer or by an organisation agreed by him
- confirmation of the availability and satisfactory condition of the fixed cargo gas detection system, including related alarms, portable gas detection equipment, and oil flash point measurement equipment.

If any inert gas system is fitted, the requirements for the annual survey of such installations given in Ch 4, Sec 3, [3.4] are applicable.

### 9.2 Class renewal survey

#### 9.2.1 Piping

Cargo, ballast, stripping and vent piping is to be examined to the Surveyor's satisfaction. Dismantling and/or thickness measurements may be required. Tightness or working tests are to be carried out. A hydraulic or hydropneumatic test is to be carried out in the event of repair or dismantling of cargo or ballast piping, or where doubts arise.

Vent line drainage arrangements are to be examined.

It is to be verified that cargo piping is electrically bonded to the hull.

#### 9.2.2 Safety valves

Safety valves on cargo piping and of cargo tanks are to be dismantled for examination, adjusted and, as applicable, resealed.

#### 9.2.3 Pumps

Ballast and stripping pumps are to be internally examined and prime movers checked. A working test is to be carried out.

Maintenance records of cargo pumps are to be made available to the Surveyor.

#### 9.2.4 Cargo pump rooms

Cargo pump room boundaries are to be generally examined. Gas-tight shaft sealing devices are to be examined. The bottom of cargo pump rooms is to be presented clean for the examination of stripping devices and gutters.

#### 9.2.5 Tank testing

Confirmation that oil recovery tank boundaries adjacent to engine rooms, if any, have been pressure tested.

If deemed necessary by the Surveyor, the tank testing may be extended.

#### 9.2.6 Electrical equipment in dangerous zones

A general examination of the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks is to be carried out for defective and non-certified safe type electrical equipment, non-approved lighting and fixtures, and improperly installed or defective or dead-end wiring.

An insulation test of circuits is to be carried out; however, where a proper record of testing is maintained, consideration may be given to accepting recent readings effected by the ship's personnel.

#### 9.2.7 Fire-fighting system

A partial test of fixed foam fire-extinguishing systems, if fitted, is to be carried out at the Surveyor's discretion.

#### 9.2.8 Instrumentation and safety devices

The fixed cargo gas detection system, including related alarms, portable gas detection equipment, and oil flashpoint measurement equipment, is to be tested.

#### 9.2.9 Inert gas system

If any inert gas system is fitted, the requirements for the class renewal survey of such installations given in Ch 4, Sec 3, [7.3] are applicable.

## 10 Anchor handling vessel

### 10.1 Annual survey

10.1.1 The survey is to include:

- visual examination of winch, including drum, end flanges, reduction gears and brakes
- visual examination of wire stopper (i.e. shark jaw, karm fork), stern roller, guide pins
- visual examination of the wire length (wire rope or chain cable)
- visual examination of equipment foundations, including related reinforcements of the structure
- general examination of hydraulic and electric systems
- winch functional test with no load in order to detect vibration, leaks, shocks or sticking points and to check emergency stop and alarms
- braking system functional test with no load
- general examination and test, as far as practicable, of emergency quick-release system
- verification of manual or planning for anchor handling operation
- the review of the Owner's service record books is to be carried out. The purpose is to verify that:
  - periodical testing of the equipment has been carried out in accordance with relevant standards, when applicable
  - eventual repair, maintenance or replacement of equipment or components are done in accordance with applicable standards
  - on-board record showing the testing of the emergency quick-release system was checked.

### 10.2 Class renewal survey

10.2.1 In addition to the requirements of annual survey, the class renewal survey is to include, as a minimum:

- verification of the equipment condition with disassembly, as deemed necessary
- control of the safety devices with disassembly, as deemed necessary
- examination of the wire length (wire rope or chain cable) and gauging
- winch static load test, as deemed necessary
- testing of emergency quick-release system, as far as practicable
- examination of the integrity of critical components with respect to corrosion, wear, overload, fatigue and other possible modes of degradation, by visual inspection and other appropriate methods
- examination of bitter end connection to ship's structure.

## 11 Cable laying ship

### 11.1 Annual survey

11.1.1 The survey is to include:

- general examination of the connections of sheaves, drums and tensioners to the structure
- general examination of fire fighting equipment, if fitted, in way of cable storage spaces and working areas.

### 11.2 Class renewal survey

11.2.1 The equipment mentioned in [11.1.1] is to be dismantled, to the extent deemed necessary by the Surveyor, in order to check its condition. Clearances of sheaves and cable drum axles are to be ascertained.

11.2.2 Fire-fighting equipment is to be submitted to a survey to the same extent as required for similar equipment at the class renewal survey for all ships (see Ch 3, Sec 3).

## 12 Lifting

### 12.1 General

12.1.1 The requirements of this Article are additional to those laid down in NR526 Rules for the Certification of Lifting Appliances onboard Ships and Offshore Units or NR595 Classification of Offshore Handling Systems, whichever is applicable.

### 12.2 Annual survey

12.2.1 The survey is to include verification and testing of the lifting equipment, as follows:

- verification of the presence onboard of the following documents:
  - technical manual

- planned maintenance system
- general examination of the electrical cabling
- functional testing of the main and alternative two-way communication system at the lifting operating position
- verification of the structural arrangement and foundations of the lifting equipment
- testing of hydraulic installations
- load tests in accordance with the rules or requirements referred to in the lifting equipment certificate.

### 12.3 Class renewal survey

**12.3.1** The requirements given in Rule Notes NR526 and NR595 are applicable for renewal survey.

In addition, load tests in accordance with the rules or requirements referred to in the lifting equipment certificate are to be carried out.

## 13 Diving support-integrated and diving support-portable

### 13.1 Annual survey

**13.1.1** The survey of the spaces containing the diving system, is to include:

- a) For non-permanent diving systems, verification that the service notation **diving support-capable** or **diving support-portable** is specified on the Certificate of Classification, in accordance with the configuration of the system
- b) Verification of the presence on-board of the following system documentation:
  - diving equipment technical manual
  - planned maintenance system
  - type approval certificates for the oxygen-measuring equipment
- c) Verification of the structural arrangement and scantling of the foundations of pressure vessels and bell handling system
- d) Verification of the fastening arrangement of the diving equipment
- e) Functional testing of the main source of electrical power, emergency source of electrical power and switching from one to the other. Verification of the satisfactory operation of the alarms and indications
- f) General examination of the electrical cabling
- g) Functional testing of the main and alternative two-way communication system at the dive location i.e. between divers, chambers, control rooms, launch point and other important locations
- h) Testing of the breathing gas installations:
  - general examination of the storage of the gas cylinders
  - verification of cleanliness of the breathing gas piping system according to the approved procedure
  - confirmation of the proper operation of the forced ventilation of the enclosed spaces for gas storage
  - verification of the means for the protection against overpressure of the oxygen installation
  - verification of the alarms of oxygen-measuring equipment
  - verification of the signboards in the area containing the gas cylinders
- i) General examination of the automatic fire detection and alarm system
- j) Verification of the suitable fixed fire-extinguishing system intended for interior spaces containing diving equipment
- k) Confirmation that the fire fighters' outfits including their self-contained compressed air breathing apparatus, and two-way portable communication apparatus, and emergency breathing masks are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged
- l) Confirmation that doors located in bulkheads forming boundaries with adjacent spaces are in a satisfactory condition
- m) General examination of the visible parts of items forming the structural fire protection, such as bulkheads, decks, doors and trunks, due attention being given to their integrity and to integrity of the insulating material.

### 13.2 Class renewal survey

**13.2.1** In addition to the requirements of annual survey, the class renewal survey of the spaces containing the diving system is to include:

- a) testing of the breathing gas installations, i.e. testing of the gas-tightness of all sealing devices of the enclosed spaces for breathing gas storage
- b) functional testing of self closing systems of door located in bulkheads forming boundaries with adjacent spaces
- c) verification of accuracy of oxygen-measuring equipment by means of calibration gas, as far as practicable
- d) verification of the sea inlet protective structure, as relevant.

## 14 Fishing vessel

### 14.1 Annual survey

14.1.1 The survey is to include:

- general examination of areas subject to damage, corrosion or wastage, such as the stern ramp, weather deck in way of the working area of the nets, connections to hull structure of masts, gantries, winches and trawl gallows (for side trawlers)
- general examination of the measures for the protection of the crew against falling overboard, such as storm rails, means of protection near stern ramp, etc.

### 14.2 Class renewal survey

14.2.1 For fishing vessels 10 years age and over, the class renewal survey is to include thickness measurements of structural elements prone to rapid wastage, such as the stern ramp, weather deck in way of the working area of the nets, connections to hull structure of masts, gantries, winches and trawl gallows (for side trawlers).

## 15 Standby and rescue vessel

### 15.1 Annual survey - Rescue arrangement, survivors accommodation and safety equipment

15.1.1 A general examination of rescue equipment and facilities, survivors spaces, safety equipment, personal care and medical provisions, in accordance with the requirements given in Part E, Chapter 10, is to be carried out.

### 15.2 Annual survey - Towing arrangements

15.2.1 A general external examination of the towing hook or towing winch, as fitted, and unhooking device, as far as practicable, is to be carried out.

### 15.3 Class renewal survey - Rescue arrangement, survivors accommodation and safety equipment

15.3.1 A general examination of rescue equipment and facilities, survivors spaces, safety equipment, personal care and medical provisions, in accordance with the requirements given in Part E, Chapter 10, is to be carried out.

Testing of rescue and safety equipment, as applicable, is to be carried out.

### 15.4 Class renewal survey - Towing arrangements

15.4.1 The survey is to include:

- checking the condition of the connection of the towing hook or towing winch to the structure, including related reinforcements of the structure
- checking the external condition of the towing hook or towing winch; when applicable, a no-load test of the unhooking device is to be carried out.

## 16 Yacht and charter yacht

### 16.1 Intermediate survey

16.1.1 The survey requirements for intermediate survey of hull and hull equipment are given in Ch 3, Sec 2 and in Rule Note NR500, Rules for the Classification and Certification of Yachts.

The survey requirements for intermediate survey of machinery and systems for ships assigned with the service notation **yacht** and having a length less than 24 m are indicated in Ch 3, Sec 1, [3].

### 16.2 Class renewal survey

16.2.1 The requirements for class renewal survey are given in Ch 3, Sec 3 for all yachts.

16.2.2 Additional survey requirements are given in NR500 for yachts with additional service feature **C** or **W** or **A**.

## 17 Semi-submersible cargo ship

### 17.1 Annual survey

17.1.1 The survey is to include a general examination and testing, where appropriate, of the following items, as applicable:

- watertightness of immersed parts on the open deck and buoyancy towers up to the maximum submerged draft
- ballast system, including:

- tank level gauges
- remote valves and position status indicator in the central ballast station
- remote pumps and status indicator in the central ballast station
- alarms of the overflow tank
- air pipe and fittings
- means to prevent overpressure for pressurized ballast tanks
- other examination and testing as per the Planned Maintenance System
- means of communication between the central ballast control system and:
  - ballast pump room
  - bridge
  - dynamic positioning control stand, when relevant
- draft mark automatic gauging system up to a representative submerged draft
- draft marks on the ship's hull up to the maximum submerged draft
- on-board stability software including:
  - special procedure when cargo is considered buoyant
  - interface with the tank level gauging system
- submersion operating manual
- ship's records and logbooks
- navigational and communication equipment, visibility and habitability, in case a secondary look-out point has been fitted.

## **17.2 Intermediate survey**

**17.2.1** The survey is to include:

- examination and thickness measurements of the submerged area, as deemed necessary by the Surveyor
- examination of critical areas of the structure, such as internal connection of the buoyancy towers, including thickness measurements and non-destructive examination, as deemed necessary. When the connection is bolted, a representative number of bolts are to be dismantled, to the satisfaction of the attending Surveyor
- internal examination of representative ballast tanks in buoyancy towers, when applicable, and thickness measurement, as deemed necessary.

Note 1: Note: If such examinations reveal no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains effective.

## **17.3 Class renewal survey**

**17.3.1** In addition to the requirements for annual survey, the renewal survey is to include:

- examination and thickness measurements, as deemed necessary by the attending Surveyor, of submerged shell above summer waterline
- examination and thickness measurements, including non-destructive examination if required, of critical areas of the structure such as buoyancy towers connection with hull or other critical areas, as found necessary by the Surveyor
- testing of submersion operation to a representative submerged draft.

## **18 Diving systems**

### **18.1 Surveys**

**18.1.1** For survey requirements, refer to Chapter 4 of NR610, Rules for the Classification of Diving Systems.

## **19 Pipe laying ship**

### **19.1 Annual survey**

**19.1.1** The annual survey is to include:

- verification of the presence onboard of the operating manual as defined in Pt E, Ch 12, Sec 1
- inspection of the structural arrangement and scantlings of the foundations of the pipe laying equipment.

### **19.2 Class renewal survey**

**19.2.1** In addition to the requirements of annual survey, the class renewal survey is to include:  
load tests in accordance with the pipe laying equipment testing program.

# Section 9                      Ships using Low Flashpoint Liquid or Gas Fuels

## 1 General

### 1.1 Application

**1.1.1** The requirements of this Section apply to all self-propelled ships, other than those covered by Ch 4, Sec 5, which utilize gas or other low flash points fuels as a fuel for propulsion prime mover/auxiliary power generation arrangements and associated systems, or which have been assigned one of the following additional service features:

- LNGfuel,
- CNGfuel,
- LPGfuel,
- methanolfuel,
- ammoniafuel,
- hydrogenfuel, or
- LFPfuel.

Note 1: These additional service features are always completed by **singlefuel** or **dualfuel** as defined in Ch 1, Sec 2, [4.16.4].

**1.1.2** These requirements are in addition to those laid down in Ch 3, Sec 1, [3.2.1], Ch 3, Sec 3, [3.1.1], Ch 3, Sec 3, [3.2.3], and Ch 3, Sec 6 as applicable.

These survey requirements do not cover fire protection, fire-fighting installation, and personnel protection equipment.

## 2 Annual survey - Hull items

### 2.1 General

**2.1.1** The following requirements are to be verified during the survey of the fuel storage, fuel bunkering system and fuel supply system.

**2.1.2** The logbooks and operating records are to be examined with regard to correct functioning of the gas detection systems, fuel supply/gas systems, etc. The hours per day of the reliquefaction plant, gas combustion unit, as applicable, the boil-off rate, and nitrogen consumption (for membrane containment systems) are to be considered together with gas detection records.

**2.1.3** The manufacturer/builder instructions and manuals covering the operations, safety and maintenance requirements and occupational health hazards relevant to fuel storage, fuel bunkering, and fuel supply and associated systems for the used of the fuel, are to be confirmed as being aboard the vessel.

### 2.2 Gas related spaces, fuel preparation and handling rooms and piping

**2.2.1** The survey is to include:

- examination of portable and fixed drip trays and insulation for the protection of the ship's structure in the event of a leakage
- examination of electrical bonding arrangements in hazardous areas, including bonded straps where fitted.

### 2.3 Fuel storage, bunkering and supply systems

**2.3.1** The following requirements are to be examined, so far as applicable. Insulation need not to be removed, but any deterioration or evidence of dampness is to be investigated.

**2.3.2** For fuel storage, the survey is to include:

- external examination of the storage tanks including secondary barrier if fitted and accessible
- general examination of the fuel storage hold place
- internal examination of tank connection space
- external examination of tank and relief valves
- verification of satisfactory operation of tank monitoring system
- examination and testing of installed bilge alarms and means of drainage of the compartment
- testing of the remote and local closing of the installed main tank valve.

**2.3.3** For fuel bunkering system, the survey is to include:

- examination of bunkering stations and the fuel bunkering system
- verification of the satisfactory operation of the fuel bunkering control, monitoring and shutdown systems.

**2.3.4** For fuel supply system, during working condition as far as practicable, the survey is to include:

- verification of the satisfactory operation of the fuel supply system control, monitoring and shutdown systems
- testing of the remote and local closing of the master fuel valve for each engine compartment.

### **3 Annual survey - Gas fuel machinery items**

#### **3.1 Control, monitoring and safety systems**

**3.1.1** The survey is to include:

- confirmation that gas detection and other leakage detection equipment in compartments containing fuel storage, fuel bunkering, and fuel supply equipment or components or associated systems, including indicators and alarms are in satisfactory operating condition
- verification that recalibration of the gas detection systems is done in accordance with the manufacturer's recommendations.
- verification of the satisfactory operation of the control, monitoring and automatic shutdown systems as far as practicable of the fuel supply and bunkering systems
- operational test, as far as practicable, of the shutdown of ESD protected machinery spaces.

#### **3.2 Fuel handling piping, machinery and equipment**

**3.2.1** The survey is to include:

- examination, as far as practicable, of piping, hoses, emergency shutdown valves, relief valves, machinery and equipment for fuel storage, fuel bunkering, and fuel supply such as venting, compressing, refrigerating, liquefying, heating, cooling or otherwise handling the fuel
- examination of the means for inerting
- confirmation, as far as practicable, of the stopping of pumps and compressors upon emergency shutdown of the system.

#### **3.3 Ventilating systems**

**3.3.1** The survey is to include:

- examination of the ventilation system, including portable ventilating equipment where fitted, is to be made for spaces containing fuel storage, fuel bunkering, and fuel supply units or components or associated systems, including air locks, pump rooms, compressor rooms, fuel preparation rooms, fuel valve rooms, control rooms and spaces containing gas burning equipment
- operational test, as far as practicable, of alarms, such as differential pressure and loss of pressure, where fitted.

#### **3.4 Hazardous areas**

**3.4.1** The survey is to include:

- examination of electrical equipment and bulkhead/deck penetrations including access openings in hazardous areas, for continued suitability for their intended service and installation area.

### **4 Intermediate survey**

#### **4.1 General**

**4.1.1** In addition to the applicable requirements of the annual surveys, the intermediate survey is also to include:

- random test of gas detectors, temperature sensors, pressure sensors, level indicators, and other equipment providing input to the fuel safety system, to confirm their satisfactory operating condition
- verification of the proper response of the fuel safety system upon fault conditions.

### **5 Class renewal survey - Hull items**

#### **5.1 General**

**5.1.1** The class renewal survey is to include, in addition to the requirements of the annual surveys, examinations, tests and checks of sufficient extent to ensure that the fuel installations are in satisfactory condition and fit for intended purpose for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

## **5.2 Fuel handling and piping**

**5.2.1** All piping for fuel storage, fuel bunkering, and fuel supply such as venting, compressing, refrigerating, liquefying, heating, storing, burning or otherwise handling the fuel and liquid nitrogen installations are to be examined.

**5.2.2** Removal of insulation from the piping and opening for examination may be required.

**5.2.3** Where deemed suspect, a hydrostatic test to 1,25 times the maximum allowable relief valve setting (MARVS) for the pipeline is to be carried out.

**5.2.4** After reassembly, the complete piping is to be tested for leaks.

**5.2.5** Where water cannot be tolerated and the piping cannot be dried prior to putting the system into service, the surveyor may accept alternative fluids or alternative means of testing.

## **5.3 Fuel valves**

**5.3.1** All emergency shutdown valves, check valves, block and bleed valves, master gas valves, remote operating valves, isolating valves for pressure relief valves in the fuel storage, fuel bunkering, and fuel supply piping systems are to be examined and proven operable.

**5.3.2** A random selection of valves is to be opened for examination.

## **5.4 Pressure relief valves**

### **5.4.1 Fuel storage tank pressure relief valves**

The survey is to include:

- opening for examination, adjustment and function test of the pressure relief valves for the fuel storage tanks
- if the tanks are equipped with relief valves with non-metallic membranes in the main or pilot valves, replacement of such non-metallic membranes.

### **5.4.2 Fuel supply and bunkering piping pressure relief valves**

The survey is to include:

- opening for examination, adjustment and function test of pressure relief valves for the fuel supply and bunkering piping
- where a proper record of continuous overhaul and retesting of individually identifiable relief valves is maintained, consideration will be given to acceptance on the basis of opening, internal examination, and testing of a representative sampling of valves, including each size and type of liquefied gas or vapor relief valve in use, provided there is logbook evidence that the remaining valves have been overhauled and tested since crediting the previous class renewal survey.

### **5.4.3 Pressure/vacuum relief valves**

The survey is to include:

- opening, examination, test and readjustment as necessary, depending on their design, of the pressure/vacuum relief valves, rupture disc and other pressure relief devices for interbarrier spaces and hold spaces.

## **5.5 Fuel storage tanks**

**5.5.1** Fuel storage tanks are to be examined in accordance with an approved survey plan.

**5.5.2** Liquefied gas fuel storage tanks are to be examined based on a survey/inspection plan, in which requirements for the survey of liquefied gas fuel containment systems are to be in accordance with the requirements laid down in Ch 4, Sec 5, [6.7] and Ch 4, Sec 5, [6.8.4], except as noted below:

- the tank insulation and tank support arrangements shall be visually examined. Non-destructive testing may be required if conditions raise doubt to the structural integrity
- vacuum insulated independent fuel storage tanks of type C without access openings need not be examined internally. Where fitted, the vacuum monitoring system shall be examined and records should be reviewed.

## **6 Class renewal survey - Gas fuel machinery items**

### **6.1 Fuel handling equipment**

**6.1.1** Fuel pumps, compressors, process pressure vessels, inert gas generators, heat exchangers and other components used in connection with fuel handling are to be examined according to the requirement of Part A, Chapter 3 or Ch 4, Sec 3, [7.3], as applicable.

## 6.2 Electrical equipment

6.2.1 The survey is to include:

- examination of electrical equipment to include the physical condition of electrical cables and supports, intrinsically safe, explosion proof, or increased features of electrical equipment
- function testing of pressurized equipment and associated alarms
- testing of systems for de-energizing electrical equipment which is not certified for use in hazardous areas
- electrical insulation resistance test of the circuit terminating in, or passing through, the hazardous zones and spaces is to be carried out.

## 6.3 Safety systems

6.3.1 Gas detectors, temperature sensors, pressure sensors, level indicators, and other equipment providing input to the fuel safety system are to be tested to confirm satisfactory operating condition.

6.3.2 Proper response of the fuel safety system upon fault conditions is to be verified.

6.3.3 Pressure, temperature and level indicating equipment are to be calibrated in accordance with the manufacturer's requirements.

## 7 Hydrogen fuel

### 7.1 General

7.1.1 In addition to the requirements set out in [2] to [6], the requirements of this Article apply to ships assigned the additional service feature **hydrogenfuel**.

### 7.2 Annual survey

#### 7.2.1 Multiple-element gas containers (MEGCs)

MEGC are to be subject to an external examination of the structure, the elements and the service equipment.

When the MEGC shows evidence of damaged or corroded areas, leakage, or other conditions that indicate a deficiency that could affect the integrity of the MEGC, additional inspection is to be performed. The extent of the additional inspection is to depend on the amount of damage or deterioration of the MEGC. It is to include at least the examinations required under [7.3.2].

### 7.3 Class renewal survey

#### 7.3.1 Compressed hydrogen cylinders

The class renewal survey of compressed hydrogen cylinders is to include the following:

- checking of the external conditions of the cylinder and verification of the equipment and the external marks
- checking of the internal conditions of the cylinder (e.g. internal inspection verification of minimum wall thickness)
- checking of the threads if there is evidence of corrosion or if the fittings are removed
- hydraulic pressure testing, and, if necessary, verification of the characteristics of the material by suitable tests
- checking of service equipment, other accessories and pressure-relief devices, if to be reintroduced into service.

Periodic inspection and tests for composite cylinders (Type 2, 3 and 4) are to be done in accordance with ISO 11623:2015.

#### 7.3.2 MEGCs

In addition to the requirements of annual survey, the class renewal survey of MEGCs is to include:

- external inspection of elements for pitting, corrosion, abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the MEGC unsafe for transport
- inspection of piping, valves, and gaskets for corroded areas, defects, and other conditions, including leakage, that might render the MEGC unsafe for filling, discharge or transport
- verification that bolts or nuts on any flanged connection or blank flange are adequately tightened.
- inspection of emergency devices and valves for corrosion, distortion and any damage or defect that could prevent their normal operation
- checking of the remote closure devices and self-closing stop-valves to demonstrate proper operation
- confirmation that the required marks on the MEGC are legible and in accordance with the applicable requirements
- verification that the framework, the supports and the arrangements for lifting the MEGC are in satisfactory condition
- pressure testing of the elements and equipment
- leak testing of the assembly of elements and equipment.

# Section 10      Ships using Fuel Cells

## 1 General

### 1.1 Application

**1.1.1** The requirements of this Section apply to ships which have been assigned the additional service feature **fuelcell**.

**1.1.2** These requirements are in addition to the requirements applicable to the remainder of the ship, given in Part A, Chapter 3, and Ch 4, Sec 9, according to the relevant surveys.

## 2 Annual surveys

### 2.1 General

**2.1.1** The logbooks and operating records are to be examined with regards to correct functioning of the gas detection systems, fuel systems, etc. The hours per day of the gas combustion unit, as applicable, and the fuel cell operation are to be considered together with gas detection records.

#### 2.1.2

The manufacturer/builder instructions and manuals covering the operations, safety and maintenance requirements and occupational health hazards relevant to systems for the use of the fuel, are to be confirmed as being available on board the vessel.

### 2.2 Fuel cell spaces

**2.2.1** The following requirements are to be examined, so far as applicable. Insulation need not to be removed, but any deterioration or evidence of dampness is to be investigated.

**2.2.2** The survey is to include:

- confirmation of satisfactory operating condition of gas detection and other leakage detection equipment in fuel cell spaces or associated systems, including indicators and alarms as applicable
- verification of recalibration of the gas detection systems in accordance with the manufacturers' recommendations
- operational test, as far as practicable, of the emergency shutdown system
- examination of the ventilation system, including portable ventilating equipment where fitted, for fuel cell spaces and associated air locks. Where alarms, such as differential pressure and loss of pressure alarms, are fitted, these should be operationally tested as far as practicable
- examination of means for inerting
- examination of the required fire protection and fire extinguishing system contained in fuel cell spaces and operational test, as far as practicable
- examination of electrical equipment and bulkhead/deck penetrations including access openings in hazardous areas for continued suitability for their intended service and installation area
- examination of portable and fixed drip trays and insulation for the protection of the ship's structure in the event of leakage
- examination of electrical bonding arrangements in hazardous areas, including bonding straps where fitted
- examination and testing of installed bilge alarms and means of drainage of the fuel cell space
- testing of the remote and local closing of the master fuel valve for each fuel cell space.

### 2.3 Fuel cell installation system

**2.3.1** The survey is to include:

- examination of the fuel cell system installation during working condition as far as practicable
- verification of satisfactory operation of the fuel cell system installation control, monitoring and shut-down systems
- examination of piping, hoses, emergency shut-down valves, remote operating valves, relief valves, machinery and equipment for handling the fuel, as far as practicable
- examination of means for inerting
- verification of stopping of reformer, pumps and compressors upon emergency shutdown of the system, as far as practicable.

### **3 Intermediate surveys**

#### **3.1 General**

**3.1.1** In addition to the applicable requirements of the annual surveys, the intermediate survey is also to include:

- random test of gas detectors, temperature sensors, pressure sensors, level indicators, and other equipment providing input to the fuel safety system, to confirm their satisfactory operating condition
- verification of the proper response of the fuel safety system upon fault conditions.

### **4 Class renewal surveys**

#### **4.1 General**

**4.1.1** The class renewal survey is to include, in addition to the requirements of the annual surveys, examinations, tests and checks of sufficient extent to ensure that the fuel installations are in satisfactory condition and fit for intended purpose for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

**4.1.2** All fuel cell installation system piping are to be examined. Removal of insulation from the piping and opening for examination may be required. Where deemed suspect, a hydrostatic test to 1,25 times the Maximum Allowable Relief Valve Setting (MARVS) for the pipeline is to be carried out. After reassembly, the complete piping is to be tested for leaks. Where water cannot be tolerated and the piping cannot be dried prior to putting the system into service, the Surveyor may accept alternative testing fluids or alternative means of testing.

**4.1.3** All emergency shut-down valves, check valves, block and bleed valves, master gas valves, remote operating valves, isolating valves for pressure relief valves in the fuel cell installation system are to be examined and proven operable. A random selection of valves is to be opened for examination.

**4.1.4** The survey is to include:

- examination of electrical equipment to include the physical condition of electrical cables and supports, intrinsically safe, explosion proof, or increased safety features of electrical equipment
- functional testing of pressurized equipment and associated alarms
- testing of systems for de-energizing electrical equipment which is not certified for use in hazardous areas
- an electrical insulation resistance test of the circuits terminating in, or passing through, the hazardous zones and spaces.

**4.1.5** Gas detectors, temperature sensors, pressure sensors, level indicators, and other equipment providing input to the fuel safety system are to be tested to confirm satisfactory operating condition.

**4.1.6** Proper response of the fuel safety system upon fault conditions is to be verified.

**4.1.7** Pressure, temperature and level indicating equipment are to be calibrated in accordance with the manufacturer's requirements.

**4.1.8** Fuel pumps, compressors, process pressure vessels, inert gas generators, heat exchangers and other components used in connection with fuel handling and parts of the fuel cell installation systems are to be examined according to the requirement of Part A, Chapter 3 or Ch 4, Sec 3, [7.3], as applicable.

# Section 11      Ships using Onboard Carbon Capture and Storage Systems

## 1 General

### 1.1 Application

1.1.1 The requirements of this Section are applicable to ships assigned the additional service feature **OCC**.

1.1.2 These requirements are in addition to the requirements applicable to the remainder of the ship, given in Part A, Chapter 3, according to the relevant surveys.

## 2 Annual survey

### 2.1 General

2.1.1 The logbooks and operating records are to be examined with regards to correct functioning of the carbon capture and storage system.

2.1.2 The manufacturer/builder instructions and manuals covering the operations, safety and maintenance requirements and occupational health hazards relevant to the system are to be confirmed as being available on board the vessel.

### 2.2 Solvent system

2.2.1 The solvent system and related accessories including piping, pumps and heat exchangers are to be examined externally and in running condition. The tightness of the system is to be ascertained.

2.2.2 The following alarm and safety devices are to be examined for correct functioning, if fitted:

- alarm and emergency safety devices
- solvent leakage detectors
- temperature control sensors
- cut off of the electric power supply in case of excessive temperature

### 2.3 Carbon capture system

2.3.1 The annual survey of the carbon capture system is to include the following items, when fitted:

- examination of the logbooks with regard to correct functioning of the carbon capture system
- confirmation that the Instrumentation, control, monitoring, and safety equipment of each system unit are operating satisfactorily
- examination of emergency shutdown or bypass valves, remote operating valves, and machinery and equipment and, as far as practicable, testing of the emergency shutdown of the system
- examination and functional test of all tanks, piping, hoses, pumps, strainers, separators, filtration units, dosing systems, and associated equipment
- examination of drip trays, shielding or insulation installed for the protection of personnel or of the ship
- examination of electrical equipment associated with the operation or monitoring of the carbon capture system
- confirmation that Personal Protective Equipment (PPE) and facilities are available onboard and maintained in good conditions
- external examination of all components including foundations and attachments
- verification of the correct operation of all remotely operated or automatically controlled valves in the handling systems
- examination of the carbon capture system during working condition, as far as practicable.

## 2.4 CO<sub>2</sub> storage system

2.4.1 The annual survey of the CO<sub>2</sub> storage system is to include the following items, when fitted:

- The logbooks and operating records are to be examined with regard to correct functioning of the gas detection systems, reliquefaction system, compression system, etc.
- the manufacturer/builder instructions and manuals covering the operations, safety and maintenance requirements are to be confirmed as being onboard
- examination of portable and fixed drip trays and insulation for the protection of the ship's structure
- external examination of the storage tanks
- external examination of the tank and relief valves
- verification of satisfactory operation of the tank pressure control, monitoring and shutdown system
- testing of the remote and local closing of the installed main tank valve
- confirmation that gas detection and other leakage detection equipment in compartments containing CO<sub>2</sub> storage, CO<sub>2</sub> handling equipment or associated systems, including indicators and alarms are in satisfactory operating condition
- verification that recalibration of the gas detection system is done in accordance with the manufacturer's recommendations
- verification of the satisfactory operation of the control, monitoring and automatic shutdown systems as far as practicable of the CO<sub>2</sub> handling systems
- confirmation, as far as practicable, of the stopping of pumps and compressors upon emergency shutdown of the system
- examination of the ventilation system, where fitted, is to be made for spaces containing CO<sub>2</sub> storage and handling systems.

## 3 Class renewal surveys

### 3.1 General

3.1.1 The class renewal survey is to include, in addition to the requirements of the annual survey, examinations, tests and checks of sufficient extent to ensure that the carbon capture and storage systems are in satisfactorily condition and fit for the intended purpose for the new period of class to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

### 3.2 Solvent system

3.2.1 Solvent piping are to be examined and operationally tested to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

The Surveyor may require dismantling and/or thickness measurements of piping. A hydraulic test is to be carried out in the event of repair or dismantling of solvent piping, or where doubts arise.

3.2.2 The satisfactory condition of the heating/cooling system is to be verified and, if deemed necessary by the Surveyor, the system is to be pressure tested.

### 3.3 Carbon capture system

3.3.1 For the carbon capture system, the associated systems and monitoring equipment, the following is also to be carried out:

- visual inspection of all pumps
- visual inspection of all bypass, mixing, isolating, shut-down or control valves
- visual examination and test of all mechanical, hydraulic and pneumatic control actuators and their power systems, as deemed necessary by the Surveyor
- dock trials on control systems, in order to verify correct operation of the automatic functions, monitoring and alarms systems, safety systems, including override of system functions if provided, manual control and automatic changeover of designated machinery associated with the carbon capture system.

### 3.4 CO<sub>2</sub> Storage system

3.4.1 For the CO<sub>2</sub> storage system, the associated systems and monitoring equipment, the following is also to be carried out:

- all piping for CO<sub>2</sub> handling and storage, such as venting, compressing, refrigerating, liquefying, storing or otherwise handling the CO<sub>2</sub> are to be examined
- removal of insulation from the piping and opening for examination may be required
- where deemed suspect, a hydrostatic test to 1,25 time the maximum allowable relief valve setting for the pipeline is to be carried out
- after reassembly, the complete piping is to be tested for leaks

- all emergency shutdown valves, check valves, remote operating valves, isolating valves for pressure relief valves are to be examined and proven operable
- a random selection of valves is to be opened for examination
- opening for examination, adjustment and function test of the pressure relief valves for the CO<sub>2</sub> storage tanks
- CO<sub>2</sub> storage tanks are to be examined in accordance with an approved survey plan
- examination of electrical equipment to include the physical condition of electrical cables and supports
- function testing of pressurized equipment and associated alarms
- gas detectors, temperature sensors, pressure sensors, level indicators and other equipment providing input to the CO<sub>2</sub> safety system are to be tested to confirm satisfactory operating condition
- proper response of the CO<sub>2</sub> safety system upon fault conditions is to be verified
- pressure, temperature and level indicating equipment are to be calibrated in accordance with the manufacturer's requirements.

# Section 12      Ships using Wind Propulsion Systems

## 1 General

### 1.1

**1.1.1** The requirements of this Section apply to ships which have been assigned one of the following additional service features or additional class notations described respectively in Ch 1, Sec 2, [4.16.3] or Ch 1, Sec 2, [6.25.5]:

#### WIND PROPULSION-1

#### WIND PROPULSION-2

**1.1.2** In order to allow a correct examination of the wind propulsion system, it is necessary to check that all the elements of it are accessible in good safety conditions.

Depending on the type of wind propulsion system, a convenient means of access, such as a basket or an equivalent system, is to be provided to the Surveyor to allow access to all elements in a safe way and a correct examination of the wind propulsion system.

**1.1.3** If sails control and manoeuvring systems are covered by **WIND PROPULSION-1** or **WIND PROPULSION-2** (for instance: furling or reefing systems), it is necessary to check that it is possible to use them during the survey without difficulty, according for instance to wind direction and speed, power supply and any other factor which may influence the survey.

**1.1.4** The laying down of the mast(s) may be requested for the survey, if the Society considers that otherwise the examination cannot be carried out satisfactorily.

## 2 Annual survey

### 2.1 General

**2.1.1** As a rule, the scope of examination is applicable to metallic system.

In the case of the use of particular materials (aluminium alloys, plastic reinforced with fibreglass or other fibre, sandwich panels,...) an adapted programme of inspection is to be carried out, after approval by the Society.

**2.1.2** For internal controls, endoscope, x-rays or any other usable means may be accepted.

**2.1.3** The annual survey programme is detailed in:

- [2.2] for wind propulsion systems less than 18 months old, and
- [2.3] for other wind propulsion systems.

Further examination and testing may be conducted if considered necessary by the Surveyor.

### 2.2 Systems less than 18 months old

**2.2.1** The scope of the annual survey of wind propulsion systems less than 18 months old is defined in [3.1] to [3.4].

### 2.3 Systems 18 months old or more

**2.3.1** The scope of the annual survey of wind propulsion systems of 18 months old or more is defined in:

- for ships assigned a notation **WIND PROPULSION-1**: [2.3.2], [2.3.4] and [2.3.5]
- for ships assigned a notation **WIND PROPULSION-2**: [2.3.2], [2.3.3], [2.3.4] and [2.3.5].

#### 2.3.2 Safety rigging parts

As a rule, the programme of survey consists of:

- visual examination of all the concerned parts
- additional examinations to the Surveyor's satisfaction on areas highly stressed or subject to severe working conditions (corrosion, vibrations,...).

#### 2.3.3 Operating rigging parts

As a rule, the programme of survey consists of:

- visual examination of all the elements and connections of the concerned items. Moving elements are to be dismantled if considered necessary by the Surveyor
- operating tests.

### **2.3.4 Drive system**

Depending on the type of drive systems, inspections are to be carried out to check:

- the working condition of the systems
- the working condition of the safety devices
- the working condition of the automated control system if such an equipment is provided.

**2.3.5** Additional examinations depending on items within the scope of the notation **WIND PROPULSION-1** or **WIND PROPULSION-2**, may be required to the Surveyor's satisfaction.

## **3 Class renewal survey**

### **3.1 General**

**3.1.1** In addition to the annual survey, the class renewal survey is to include:

- for ships assigned a notation **WIND PROPULSION-1**: [3.2] and [3.4]
- for ships assigned a notation **WIND PROPULSION-2**: [3.2], [3.3] and [3.4].

### **3.2 Safety rigging parts**

**3.2.1** Systematic dismantling may be required by the Society, depending on a maintenance programme, to the Surveyor's satisfaction.

As a rule, a mast and its safety rigging parts are to be entirely dismantled once every five years. This duration may be modified after a probationary period determined on case by case basis by the Society.

#### **3.2.2 Mast or rotor structure**

The examination of mast or rotor structure, including spreaders if applicable, consists of close up survey of:

- the masts or rotor and of their assembling zones (welded, riveted zones)
- all the connecting elements. Additional examinations and non destructive tests may be required by the Surveyor
- the rigging connection elements
- the internal corrosion of the structure
- the structure of the lower part of the masts: additional controls and/or non-destructive tests are to be carried out to check the good behaviour of the base of the masts (connections to the decks)
- equipment fittings on the masts or rotors.

The extent of the non-destructive tests is determined by the Surveyor taking into account the general maintenance conditions and previous test results.

The Surveyor may require an examination of the uprightness of the spreaders. The sags are to be compared with the previous or initial data.

#### **3.2.3 Connection fittings and ropes**

The examination of the connection fittings and ropes consists of:

- visual examination of the connection fittings: turnbuckles, forks, chainplates, etc...
- visual examination of the wire ends (about 10% of the wire lengths) to check the absence of corrosion cracks or broken wires.

The forestay wire ropes are to be carefully examined, especially if furling systems are fitted:

- upper and lower ends
- wire areas on which furling system bearings are supported.

#### **3.2.4 Control of pretensioning**

If the safety rigging parts has been examined by the Society for precise working conditions (pretensioning, fitting of additional movable forestays or backstays) the Surveyor is to be able to check that these working conditions are complied with.

Additional tests and/or measurements may be required.

### **3.3 Operating rigging parts**

**3.3.1** Examination of operating rigging parts includes:

- general examination of related items (halyards, sheets, blocks...), in accordance with the maintenance plan
- non-destructive tests on mounting and slewing rings to detect possible cracks.

### 3.3.2 Moving elements

Moving elements are to be dismantled at the Surveyor's satisfaction.

As a rule, the following elements are to be removed:

- every hinged connection to allow checking of the state of pins and bearings
- several fixing bolts of the mounting and slewing rings of rotative systems to check their state.

The replacement of the removed bolts (screws, nuts and washers) is recommended.

### 3.3.3 Manoeuvring system

Examination of manoeuvring system, for example furling or reefing system, consists of an extensive examination to detect any abnormal wearing, clearance:

- checking of external and internal state of the furling rods (paint or cathodic protection, corrosion, residual thickness,...)
- checking of the state of the connections of the furling rods, (for riveted or glued connections, it may be required to dismantle some of the elements to check the general condition of the system)
- checking of the state of the bearings:
  - end bearings (stay) are to be dismantled at each survey. If not possible, tests are to be carried out at the Surveyor's satisfaction
  - intermediate bearings: depending on the type.

### 3.3.4 Sails

When the sails are within the scope of the notation, additional examination may be required in accordance with the maintenance plan.

## 3.4 Drive system

**3.4.1** The extent of annual survey of drive system as described in [2.3.4] is applicable.

# Appendix 1 Oil Tanker Longitudinal Strength Assessment

## 1 General

### 1.1

**1.1.1** The criteria indicated in this Appendix are to be used for the evaluation of longitudinal strength of the ship's hull girder as required by Ch 4, Sec 3, [1.3.2].

**1.1.2** In order that ship's longitudinal strength to be evaluated can be recognized as valid, fillet welding between longitudinal internal members and hull envelopes are to be in sound condition so as to keep integrity of longitudinal internal members with hull envelopes.

## 2 Evaluation of longitudinal strength

### 2.1 Application

**2.1.1** The requirements given in this Article apply to ships contracted for construction before 1st July 2022. For ships contracted for construction on or after 1st July 2022, general criteria given in Ch 2, App 3, [4.5.4] apply.

### 2.2 Transverse sectional areas

**2.2.1** The transverse sectional areas of deck flange (deck plating and deck longitudinals) and bottom flange (bottom shell plating and bottom longitudinals) of the ship's hull girder are to be calculated by using the thickness measured, renewed or reinforced, as appropriate, during the class renewal survey.

**2.2.2** If the diminution of sectional areas of either deck or bottom flange exceeds 10% of their respective as-built area (i.e. original sectional area when the ship was built), either one of the following measures is to be taken:

- to renew or reinforce the deck or bottom flanges so that the actual sectional area is not less than 90% of the as-built area; or
- to calculate the actual section moduli ( $Z_{act}$ ) of transverse section of the ship's hull girder by applying the calculation method specified in [2.4], by using the thickness measured, renewed or reinforced, as appropriate, during the class renewal survey.

### 2.3 Transverse section modulus

**2.3.1** The actual section modulus ( $Z_{act}$ ) of the transverse section of the ship's hull girder calculated in accordance with item b) of [2.2.2] is not to be less than 90% of the required section modulus for new buildings  $Z_{R, MIN}$  or  $Z_R$ , whichever is the greater, specified in Pt B, Ch 6, Sec 1 of the edition July 2021 of NR467 Rules for the Classification of Steel Ships, as amended in January 2022.

### 2.4 Calculation criteria of section modulus

**2.4.1** When calculating the transverse section modulus of the ship's hull girder, the requirements under Pt B, Ch 6, Sec 1 of the edition July 2021 of NR467 Rules for the Classification of Steel Ships, as amended in January 2022, should be applied.

## 3 Sampling method of thickness measurements

### 3.1 Extent of evaluation

**3.1.1** Longitudinal strength should be evaluated within 0,4L amidships for the extent of the hull girder length that contains tanks therein and within 0,5L amidships for adjacent tanks which may extend beyond 0,4L amidships where tanks means ballast tanks and cargo tanks.

### 3.2 Sampling method of thickness measurements

**3.2.1** Transverse sections should be chosen such that thickness measurements can be taken for as many different tanks in corrosive environment as possible, e.g. ballast tanks sharing a common plane boundary with cargo tanks fitted with heating coils, other ballast tanks, cargo tanks permitted to be filled with sea water and other cargo tanks. Ballast tanks sharing a common plane boundary with cargo tanks fitted with heating coils and cargo tanks permitted to be filled with sea water should be selected where present.

**3.2.2** The minimum number of transverse sections to be sampled should be in accordance with the requirements for the current class renewal survey. The transverse sections should be located where the largest thickness reductions are suspected to occur or are revealed from deck and bottom plating measurements required in Ch 4, Sec 3, Tab 5 and should be clear of areas which have been locally renewed or reinforced.

**3.2.3** At least two points should be measured on each deck plate and/or bottom shell plate required to be measured within the cargo area in accordance with the requirements for the current class renewal survey.

**3.2.4** Within 0,1 D (where D is the ship's moulded depth) of the deck and the bottom at each transverse section to be measured, every longitudinal and girder should be measured on the web and face plate, and every plate should be measured at one point between longitudinals.

**3.2.5** For longitudinal members other than those specified in [3.2.4] to be measured at each transverse section, every longitudinal and girder should be measured on the web and face plate, and every plate should be measured at least in one point per strake.

**3.2.6** The thickness of each component should be determined by averaging all of the measurements in way of the transverse section on each component.

### **3.3 Additional measurements**

**3.3.1** Where one or more of the transverse sections are found to be deficient in respect of the longitudinal strength requirements given in this Appendix, the number of transverse sections for thickness measurements should be increased such that each tank within the 0,5L amidships region has been sampled. Tank spaces that are partially within, but extend beyond, the 0,5 L region should be sampled.

**3.3.2** Additional thickness measurements should also be performed on one transverse section forward and one aft of each repaired area to the extent necessary to ensure that the areas bordering the repaired section also comply with the requirements of this Appendix.

### **3.4 Repair methods**

**3.4.1** The extent of renewal or reinforcement carried out to comply with this Appendix should be in accordance with [3.4.2].

**3.4.2** The minimum continuous length of a renewed or reinforced structural member should be not less than twice the spacing of the primary members in way. In addition, the thickness diminution in way of the butt joint of each joining member forward and aft of the replaced member (plates, stiffeners, girder webs and flanges, etc.) should not be within the substantial corrosion range (75% of the allowable diminution associated with each particular member). Where differences in thickness at the butt joint exceed 15% of the lower thickness, a transition taper should be provided.

**3.4.3** Alternative repair methods involving the fitting of straps or structural member modification should be subject to special consideration. In considering the fitting of straps, it should be limited to the following conditions:

- to restore and/or increase longitudinal strength;
- the thickness diminution of the deck or bottom plating to be reinforced should not be within the substantial corrosion range (75% of the allowable diminution associated with the deck plating)
- the alignment and arrangement, including the termination of the straps, is in accordance with a standard recognized by the Society
- the straps are continuous over the entire 0,5 L amidships length; and
- continuous fillet welding and full penetration welds are used at butt welding and, depending on the width of the strap, slot welds. The welding procedures applied must be acceptable to the Society.

**3.4.4** The existing structure adjacent to replacement areas and in conjunction with the fitted straps should be capable of withstanding the applied loads, taking into account the buckling resistance and the condition of welds between the longitudinal members and hull envelope plating.

Section 18	Additional Notations for Corrosion Protection
Section 19	Other Notations

# Section 1 General

## 1 General

### 1.1

**1.1.1** The purpose of this Chapter is to give details on the scope of surveys of specific equipment and systems fitted on board the ship, which are covered by an additional class notation. Unless otherwise specified in Ch 1, Sec 2, [6], the scope of these surveys provides the requirements to be complied with for the maintenance of the relevant additional class notation.

**1.1.2** These specific requirements are additional to those laid down in Part A, Chapter 3 and Part A, Chapter 4. These surveys are to be carried out at intervals as described in Ch 2, Sec 2, as far as possible concurrently with the surveys of the same type, i.e. annual, intermediate or class renewal survey.

**1.1.3** The equipment and systems are also to be submitted to occasional survey whenever one of the cases indicated in Ch 2, Sec 2, [6] occurs.

**1.1.4** Where specific requirements are given for the class renewal survey, they are additional to the requirements for the annual survey, which, in accordance with Ch 3, Sec 3, [1.1.7], is to be carried out at the completion of the class renewal survey.

**1.1.5** For the assignment of the additional class notations, ships are to be submitted to an admission to class survey as described in Ch 2, Sec 1, [2] and Ch 2, Sec 1, [3] for new and existing installations, respectively, as applicable.

## 2 Additional class notations subject to additional surveys

### 2.1

**2.1.1** The specific requirements detailed in this Chapter are linked to the additional class notation(s) assigned to the ship. Where a ship has more than one additional class notation, the specific requirements linked to each additional class notation are applicable as long as they are not contradictory.

**2.1.2** Tab 1 indicates which additional class notations are subject to specific requirements, and in which Section and/or Article they are specified.

**Table 1 : Additional class notations for which specific survey requirements are applicable**

Additional class notation	Section or Article applicable in this Chapter	Type of surveys affected by these specific requirements

Other notations: <b>ACCESS</b> <b>HEL</b> <b>OAS</b> <b>OHS</b>	Ch 5, Sec 19	as applicable in accordance with the related Articles in Ch 5, Sec 19

## Section 2 VeriSTAR and STAR Notations

### 1 General

#### 1.1 Application

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to the VeriSTAR system, as described in Ch 1, Sec 2, [6.2]:

STAR-HULL

VeriSTAR-HULL SIS

STAR-MACH SIS

### 2 VeriSTAR-HULL SIS

#### 2.1 General

2.1.1 The additional class notation **VeriSTAR-HULL SIS** was assigned at the design stage or after construction, and is maintained during the service life, to ships complying with the requirements of Ch 1, Sec 2, [6.2.2] and Ch 1, Sec 2, [6.2.3].

2.1.2 The additional class notation **VeriSTAR-HULL SIS** was assigned to a ship in order to reflect the following:

- a structural tridimensional analysis has been performed for the hull structures, as defined in Pt B, Ch 7, App 1 or Pt B, Ch 7, App 2 or Pt B, Ch 7, App 3, as applicable, of NR 467 Rules for the classification of steel ships, edition July 2021.
- the hull structure condition is periodically assessed, usually at the class renewal survey, using the results of the inspections and thickness measurements performed during the survey. The results of this assessment are made available to the Owner.

2.1.3 **The following is to be available on board:**

- the class renewal survey report
- the results of the periodical structural reassessments done after each class renewal survey
- the Society's requirements for structural repairs and renewals
- the hot spot map of the structure.

#### 2.2 Class renewal survey

2.2.1 The survey for the renewal of the **VeriSTAR-HULL SIS** notation is to be carried out concurrently with the class renewal survey.

The documentation to be prepared, the surveys to be carried out and the structural reassessment to be done in connection with the class renewal survey are summarized in the flowchart shown in Fig 1.

**Figure 1 : Actions to be taken in connection with the class renewal survey (VeriSTAR-HULL SIS)**

**2.2.2** In addition to the scope of the class renewal survey as required for the ship concerned, additional thickness measurements and surveys may be required by the Society taking into account the surveys, thickness measurements and a specific survey for fatigue fracture detection carried out as a result of the previous hot spot map.

**2.2.3** The acceptance criteria for measured thicknesses are given in Ch 2, App 3, or in the edition July 2021 (as amended in January 2022) of NR467 Rules for the Classification of Steel Ships, Pt F, Ch 1, App 2 for items as deemed appropriate by the Society (for example a plating panel or an ordinary stiffener).

When the acceptance criteria are not fulfilled, actions according to [2.2.4] are to be taken.

**2.2.4** For each item, thicknesses are measured at several points and the average value of these thicknesses is to satisfy the acceptance criteria for the relevant item.

If the criteria of measured thicknesses are not fulfilled for an item, then this item is to be repaired or replaced.

**2.2.5** Once the renewal survey is completed to the Society satisfaction, the “after survey” hot spot map is prepared and submitted to the Society.

## **3 STAR-HULL**

### **3.1 General**

**3.1.1** The additional class notation **STAR-HULL** was assigned to a ship in order to reflect the fact that a procedure including periodical and corrective maintenance, as well as periodical and occasional inspections of hull structures and equipment, (hereafter referred to as the Inspection and Maintenance Plan - IMP) are dealt with on board by the crew and at the Owner’s offices.

The assignment of the notation implied that a structural tridimensional analysis had been performed for the hull structures, as defined in Pt B, Ch 7, App 1 or Pt B, Ch 7, App 2 or Pt B, Ch 7, App 3, as applicable, of NR 467 Rules for the classification of steel ships, edition July 2021.

The implementation of the Inspection and Maintenance Plan is surveyed by the Society through periodical check of the hull structure, normally at the class renewal survey, against defined acceptance criteria and based on:

- the collected data from actual implementation of the Inspection and Maintenance Plan
- the results of the inspections, thickness measurements and other checks carried out during the class renewal survey.

### **3.2 Class renewal survey**

**3.2.1** In addition to the scope of the class renewal survey as required for the ship concerned (see Fig 2), the following is to be carried out:

- the assessment of the condition of coating and anodes
- additional thickness measurements and surveys may be required by the Society
- a specific survey for fatigue fracture detection as a result of the previous hot spot map.

**3.2.2** Once the renewal survey is completed to the Society satisfaction, the “after survey” hot spot map is to be prepared and submitted to the Society, as well as the Inspection and Maintenance Plan, updated as needed.

### **3.3 Suspension and withdrawal of the notation**

**3.3.1** The maintenance of the **STAR-HULL** notation is subject to the same principles as those for the maintenance of class: surveys are to be carried out by their limit dates and possible conditions of class (related to the notation) are to be dealt with by their limit dates.

The suspension of class automatically causes the suspension of the **STAR-HULL** notation.

**3.3.2** Various events may lead either to imposition of a condition of class related to the **STAR-HULL** notation or to suspension of the notation itself. Some cases are given below.

- The condition of the ship is below the minimum level required for class (e.g. scantling of a hull structure below the corrosion margin). The action to be taken is either the immediate repair or the imposition of a condition of class for the class (if acceptable) and suspension of the **STAR-HULL** notation. However, in cases where the condition of class is of a minor nature, the notation may not be suspended.
- The condition of the ship is below the minimum level for the **STAR-HULL** notation, but still above the level for the class (e.g. the scantling of a hull structure is below the corrosion margin acceptable for the notation but is still above the corrosion margin). The action to be taken is either the immediate repair or the imposition of a condition of class for the **STAR-HULL** notation (without condition of class for class).
- The Inspection and Maintenance Plan is not complied with (e.g. delays in performing the operations programmed according to the plan or the scope of inspection and/or maintenance not completely fulfilled).

The action to be taken is:

- either the immediate compliance with the requirements or the imposition of a condition of class if the non-conformity is of a minor nature or is an exceptional occurrence
- or the suspension of the **STAR-HULL** notation if the non-conformity is of a major nature or a recurrence.
- A defect or a deficiency is found in applying the IMP. The actions to be taken are the same as stated both for repair of structure/coating/equipment (first two cases above) and for the application of the IMP (third case above).
- An unexpected defect or deficiency is found or an accident occurs, i.e. not as a result of lack of maintenance or failure in the application of the IMP. The actions to be taken are the same as stated for repair of structure/coating/equipment (first two cases above).

**3.3.3** The withdrawal of the **STAR-HULL** notation may be decided in different cases, such as:

- recurrent suspension of the **STAR-HULL** notation
- suspension of the **STAR-HULL** notation for more than a given period (i.e. 3 months)
- expiry or withdrawal of class.

**Figure 2 : Actions to be taken in connection with the class renewal survey (STAR-HULL)**

## 4 STAR-MACH SIS

### 4.1 General

**4.1.1** The additional class notation **STAR-MACH SIS**, as described in Ch 1, Sec 2, [6.2.5], is assigned as per the requirements of Pt F, Ch 1, Sec 2. The present Article gives requirements for the maintenance of this notation.

**4.1.2** The Maintenance Plan based on a risk analysis shall be dynamic and subject to a continuous improvement process. The Operator is to collect, analyse, review and react to equipment historical data throughout the ship operating life in order to tune the Maintenance Plan accordingly.

### 4.2 Annual audit and confirmatory surveys

**4.2.1** The annual shipboard audit and confirmatory surveys are to be carried out in conjunction with the annual survey and in accordance with the requirements of Ch 2, App 1, [5.2].

The scope of this audit and of the confirmatory surveys is to include the ship's items which are covered by the notation in addition to the PMS machinery items.

### **4.3 Re-approval of the Maintenance Plan**

**4.3.1** Once in each five year class period, on receipt of the documents listed in [4.3.2], the Society performs a documentation technical review of the elements demonstrating a continuous improvement process of the risk analysis, including the updated maintenance plan, as described in Pt F, Ch 1, Sec 2, [2.2.2], in order to re-approve the maintenance plan.

On a case by case basis, if the risk analysis update is not documented, the Society can update the risk analysis, based on the submitted documentation, in order to re-approve the maintenance plan.

**4.3.2** The following documentation is to be submitted to the Society for review:

- Methodology for continuous improvement / tuning of the Reliability Centred Maintenance (RCM) study

Note 1: See Pt F, Ch 1, Sec 2, [1.2] for the definition of RCM.

- Any modification or update in the RCM study documents since the last Maintenance Plan approval, see Pt F, Ch 1, Sec 2, [2.1.1]
- Any modification of the systems design since the last Maintenance Plan approval, see Pt F, Ch 1, Sec 2, [2.1.2]
- Any modification of the ship operation since the last Maintenance Plan approval
- Any modification of the Maintenance Plan since its last approval, including information detailed in Pt F, Ch 1, Sec 2, [2.1.3]
- Available historical data since the last Maintenance Plan approval, see Pt F, Ch 1, Sec 2, [2.1.4].

**4.3.3** If the Maintenance Plan is not re-approved in due time in order to maintain the **STAR-MACH SIS** notation for the class certificate renewal, the **STAR-MACH SIS** notation will be converted in **STAR-MACH** notation.

## Section 3 Availability of Machinery

### 1 General

#### 1.1

**1.1.1** The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to availability of machinery, as described in Ch 1, Sec 2, [6.3]:

**AVM-APS**

**AVM-DPS**

**AVM-IPS**

**AVM-FIRE**

### 2 Annual survey

#### 2.1

**2.1.1** At each annual survey the Owner or his representative is to declare to the attending Surveyor that no modifications have been made to the systems affecting the notations without prior approval by the Society.

### 3 Class renewal survey

#### 3.1

**3.1.1** At each class renewal survey a test is to be conducted in order to ascertain that the systems affecting the notations operate satisfactorily. This test is usually to be carried out during sea trials.

## Section 4 Automated Machinery Systems

### 1 General

#### 1.1

**1.1.1** The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to automated machinery systems, as described in Ch 1, Sec 2, [6.4]:

**AUT-UMS**

**AUT-CCS**

**AUT-PORT**

**AUT-IMS**

### 2 Annual survey

#### 2.1

**2.1.1** The Owner or his representative is to declare to the attending Surveyor that no significant modifications have been made without prior approval by the Society.

**2.1.2** The annual survey is to include:

- an examination of the engineers' log-book to verify the proper operation of automation systems in the period subsequent to the last survey and measures taken to avoid repetition of any malfunctions or failures which have occurred during the same period
- a general examination of the control systems covered by the notation, including a random check of the proper operation and calibration of main measuring, monitoring, alarm, and automatic shut-off devices
- a check of the fire detectors
- a check of the bilge flooding alarms
- a running test which may be also performed by a spot check method.

### 3 Class renewal survey

#### 3.1

**3.1.1** The requirements given in Article [2] for annual survey are to be complied with.

An additional program of examinations, checks and tests is to be devised in agreement with the Owner and based on the operational data and experience of previous surveys. This program is to include verification of the calibration of instruments, testing of control and safety functions of the machinery and black-out test. The Owner is to produce evidence that all these checks and tests have been carried out and this will be verified by the Surveyor at random.

In addition, the proper operation of the control system of propulsion machinery is to be checked during sea trials.

# Section 5 Integrated and Digital Systems

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to integrated and digital systems, as described in Ch 1, Sec 2, [6.5]:

**SYS-NEQ** or **SYS-NEQ-1**

**SYS-COM**

**SYS-IBS** or **SYS-IBS-1**

**ASYNC-COM** or **ASYNC-COM-R**

**SYNC-COM** or **SYNC-COM-R**

**DATA-INFRA** or **DATA-INFRA-STAND**

## 2 Annual survey

### 2.1 All notations

2.1.1 The Owner or his representative is to declare to the attending Surveyor that no significant modifications have been made to the relevant installations without the prior approval by the Society.

An examination of the log-books is to be carried out to verify the proper operation of systems in the period subsequent to the last survey and measures taken to avoid repetition of any malfunctions or failures which have occurred during the same period.

### 2.2 Notations **SYS-NEQ** and **SYS-NEQ-1**

2.2.1 The annual survey is to include:

a) general:

- general examination of the bridge layout, with regard to the field of vision, window wipe and wash system, wheelhouse lighting and heating/cooling systems, and arrangements for the safety of navigators

b) propulsion and steering controls:

- test of the steering gear to confirm the proper operation of the various remote controls from the wheelhouse
- test, as far as practicable, of the propulsion control, including propeller pitch control, where fitted
- check of the relevant indicators such as rudder angle, ahead/astern position, propeller rpm or pitch

c) navigation aids:

- test of the satisfactory operating condition of radars
- test of the functions available at quay side of the ARPA and collision avoidance system
- test of the position fixing system
- test of the gyro compass system
- test of the echo sounding device, using appropriate scale of depth
- test of other available alarms (sounding equipment, self-checking device, etc.), as far as practicable

d) communications:

- test of the whistle control device from the relevant workstation
- check of the different communication systems (internal communication, VHF radiotelephone installation, NAVTEX)

e) bridge safety and alarm system (notation **SYS-NEQ-1**)

- test, as far as practicable, of the vigilance system and related alarm/warning transfer system.

### 2.3 Notation **SYS-COM**

2.3.1 The annual survey is to include a check of the means of transmission (hardware and software) as follows:

- a) compliance of the environmental conditions of use of the components (such as temperature, power supply) with those for which they were approved
- b) verification of the correct installation on board, including hardware (cabling, location of aerial, layout of console) and software (such as software version, software registry, compatibility of assembled software, man machine interface)

- c) verification by means of an appropriate test of the proper function of:
  - the internal communication between the different workstations, checking at random the availability of data
  - the external communication with the shore; consideration may be given to recent records of such external communication from ship to shore and from shore to ship
- d) verification of update policies description report, crisis management manual, security risk management process report.

## **2.4 Notations SYS-IBS and SYS-IBS-1**

**2.4.1** The annual survey is to include a check of the condition of the different workstations that belong to the IBS system, and a test, as far as practicable, of:

- the main functions of the IBS; in this respect, the examinations and tests given in [2.2.1] are to be carried out, where applicable
- the transitional and emergency sources required for the system and recovery of systems after restoring power
- the alarm and monitoring system in the wheelhouse, at random.

## **2.5 Notations ASYNC-COM, SYNC-COM, ASYNC-COM-R and SYNC-COM-R**

**2.5.1** The annual survey includes checking the following items:

- transmission log for the last month to confirm regular data exchanges by connected systems
- subscription validity for the external communication provider for the communication devices in use by onboard connected systems
- visual examination of antennas and cabling of the communication devices.

**2.5.2** In addition to the scope defined in [2.5.1], the annual survey for notations **ASYNC-COM-R** and **SYNC-COM-R** is to include the following:

- checking if the connected system has been operated within the geographic area of the redundant coverage by randomly checking the latest passage plans and reports for activities which involve the use of the connected system
- a test of a communication device changeover following a simulated single failure due to a loss of the power supply as per the FMEA test programme for the ship-shore communication system.

**2.5.3** In addition to the scope defined in [2.5.1], the annual survey for the notation **SYNC-COM** and **SYNC-COM-R** is to include the following:

- checking if the connected system is operated in the same degree of remote control (RC0, RC1, RC2 or RC3) as defined in the documentation submitted
- checking if the latency observed at the time of the most recent remote operations is below the latency threshold described in Pt F, Ch 4, Sec 3, [4.1.2]
- where the ship-shore communication system is used for remote control over Cat. II or Cat. III systems, a test of the control transfer between Remote Operations Centre and the ship.

## **2.6 Notations DATA-INFRA and DATA-INFRA-STAND**

**2.6.1** The Owner has to declare to the Society any major modifications to the data infrastructure.

**2.6.2** The annual survey includes checking, the following items:

- general visual examination of the network devices
- ship-shore communication subscription has not been downgraded

Note 1: In case of diminution of the ship-shore subscription, new tests may be carried out at the discretion of the Society.

- record of failures log
- calibration of sensors and equipment, when applicable
- verification that the documentation listed in Pt F, Ch 4, Sec 4, Tab 1, items 9 and 10 is available on board
- check of the Service Level Definition report as defined in Pt F, Ch 4, Sec 4, [10.4]
- personnel for network maintenance is identified and familiar with the dedicated documentation and procedures.

## **3 Class renewal survey**

### **3.1 Notations SYS-NEQ, SYS-NEQ-1, SYS-COM, SYS-IBS and SYS-IBS-1**

**3.1.1** The requirements given in [2] for annual survey are to be complied with. An additional program of examinations, checks and tests is to be devised in agreement with the Owner and based on the operational data and experience of previous surveys. This program is to include verification of the calibration of instruments and testing of control and safety functions of the installation. An additional program of random tests of the systems is to be performed during sea trials.

The Owner is to confirm that any modification to the hardware and software is fully documented and properly recorded.

### **3.2 Notations ASYNC-COM, SYNC-COM, ASYNC-COM-R and SYNC-COM-R**

**3.2.1** In addition to the scope defined in [2.1] and [2.5] the class renewal survey includes the following items:

- demonstration of a two-way transmission of the two test data packages between the ship and the shore in the scope of testing the communication management software
- checking the transmission log to confirm that the test data is transferred in an order established by the priority.

**3.2.2** In addition to the scope defined in [3.2.1], the class renewal survey for notations **ASYNC-COM-R** and **SYNC-COM-R** includes the following items:

- checking the transmission schedule in the communication management software
- complete testing of the protection, detection and alarms as per the FMEA test programme for the ship-shore communication system.

**3.2.3** In addition to the scope defined in [3.2.1], the class renewal survey for notations **SYNC-COM** and **SYNC-COM-R** includes the following items:

- it is to be demonstrated to the Surveyor that during each functional test the latency threshold described in Pt F, Ch 4, Sec 3, [4.1.2] has not been exceeded, unless the test includes degrading the latency intentionally or includes intentionally stopping the ship-shore communication.
- where the ship-shore communication system is used for remote control over Cat. II or Cat. III systems, as defined in Pt C, Ch 3, Sec 3, [2.3], the following tests are to be witnessed by the Surveyor for the data involved in the control loop between the connected system and the Remote Operations Centre:
  - test for detecting repetition, deletion, insertion and re-sequencing
  - test for detecting a message time out
  - test of the local emergency shut down panel for the ship-shore communication system.
- if directional antennas are used, testing of the automatic azimuth seeking by performing a 360° turn.
- where multiple communication devices are used, validation of the traffic balancing in separate tests by:
  - disabling the communication device with the highest outbound traffic allowance, and
  - disabling the communication devices operating on the same radio frequency band, if more than one radio frequency band is used.
- the sea trials are to be performed to validate the functional specification of ship-shore communication modes defined in Pt F, Ch 4, Sec 3, [4.1.3] with either onboard witnessing by a Surveyor, or witnessing by a Surveyor remotely from the Remote Operations Centre.

### **3.3 Notations DATA-INFRA and DATA-INFRA-STAND**

**3.3.1** In addition to the scope in [2] the class renewal survey includes the following items:

- on board testing as per Pt F, Ch 4, Sec 4, [11.2].

## Section 6 Monitoring Equipment

### 1 General

#### 1.1 Application

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to hull and tailshaft monitoring equipment, as described in Ch 1, Sec 2, [6.6]:

MON-HULL

MON-SHAFT

MON-ICE L(i)

MON-ICE G

CII-REALTIME

### 2 MON-HULL

#### 2.1 Annual and class renewal survey

2.1.1 The Owner or his representative is to declare to the attending Surveyor that the hull monitoring equipment has been recently calibrated using a reference loading case.

### 3 MON-SHAFT

#### 3.1 Tailshaft survey

##### 3.1.1 General

For ships fitted with either oil lubricated or water lubricated tailshaft bearings and assigned with the additional class notation **MON-SHAFT**, in addition to the conditions stated in Ch 2, Sec 2, [5.5.3] and the additional survey requirements stated in [3.1.2] and [3.1.3], the tailshaft need not be withdrawn at both the complete and the modified surveys, provided that all the condition monitoring data are found to be within the permissible limits and the remaining requirements for the respective surveys are complied with.

##### 3.1.2 Requirements for oil lubricated tailshaft bearings

The scope of the requirements for the modified and complete surveys is specified in Ch 2, Sec 2, [5.5.3].

When the records of the tailshaft bearing temperature readings are checked and doubts arise, the Surveyor may require the verification of the accuracy of the gauging devices.

##### 3.1.3 Requirements for water lubricated tailshaft bearings

In the scope of the applicable survey requirements specified in Ch 2, Sec 2, [5.5.3], the following additional requirements are to be fulfilled at modified survey, when applicable:

- verification of the aft bearing clearances
- examination of the endoscopic records and results
- external examination of the water pumping and filtering system and confirmation that such equipment operate satisfactorily
- examination of water analysis records (chloride content and presence of bearing material or other particles)
- verification of alarms (flow etc.) and interlock system.

### 4 MON-ICE L(i) and MON-ICE G

#### 4.1 Annual survey

4.1.1 The Owner or his representative is to declare to the attending Surveyor that:

- all the components of the ice load monitoring system are able to ensure the main functions
- the ice load monitoring equipment has been calibrated complying with the declaration of the Manufacturer for the period and procedure of calibration.

## **5 Real-time carbon intensity indicator (CII-REALTIME)**

### **5.1 Annual survey**

**5.1.1** The annual survey includes checking of the following items for CII ODS (Onboard Digital Solution):

- reports generated available on board by the CII ODS as listed in Pt F, Ch 5, Sec 3, [2.2.1] at the time of survey in compliance with the regulations indicated in the Type Approval Certificate and the applicable regulations when the annual survey is performed
- maintenance records for the entries concerning hardware repair, maintenance or replacement of equipment or components
- maintenance and calibration records for the measurement instrumentation for the fuel quantity stored and transferred.

### **5.2 Class renewal survey**

**5.2.1** In addition to the scope of the annual survey as listed in [5.1.1], the class renewal survey includes the following items:

- functional test of the CII ODS (Onboard Digital Solution) by completion of entries for one day
- when calculations can be done by the CII ODS, functional test of the CII ODS by checking the results of calculations against the endorsed test datasets
- functional test by synchronising the CII ODS with the CII SDS (Shore Digital Solution)
- functional test of the CII SDS by viewing the Continuous CII updated with the new entries created on board as a part of the test, the CII SDS is to be accessed by an external Internet connection
- when calculations can be done by the CII SDS, functional test of the CII SDS by checking the results of calculations against the endorsed test datasets.

## Section 7

# Comfort on Board and Habitability

### 1 General

#### 1.1

**1.1.1** The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.7]:

**COMF-NOISE-SIS, COMF-NOISE-Pax-SIS, COMF-NOISE-Crew-SIS**

**COMF-VIB-SIS, COMF-VIB-Pax-SIS, COMF-VIB-Crew-SIS**

**COMF+-SIS**

**HABITABILITY**

**1.1.2** The Owner is to inform the Society in order to submit the ship to a survey so as to maintain the additional class notations after modifications, alterations or repairs which could affect the noise and vibration environment have occurred.

#### 1.2 Annual survey

**1.2.1** The Owner or his representative is to declare to the attending Surveyor that no significant modifications have been made without the prior approval of the Society, in particular with respect to:

- modifications/repairs carried out in crew or passenger accommodations
- HVAC/duct routing modifications
- machinery modifications, main repairs
- list of any alterations, repairs or damages.

#### 1.3 Class renewal survey

**1.3.1** The general wear of the ship can induce vibration and noise increase. A survey, including noise and vibration measurements in harbour and sea conditions as well as insulation and impact noise measurements, is to be carried out. Measurements can be limited in comparison to initial survey measuring points depending on ship's type:

- for cargo ships, 30% of initial survey measuring points
- for passenger ships, 30% of initial survey measuring points (excluding passenger cabins) and 10% of initial survey measuring points in passenger cabins.

In case of additional class notation **HABITABILITY**, noise measurements in harbour and sea conditions, insulation and impact noise measurements are to be carried out only in case of significant modifications, as stated in [1.2.1].

# Section 8 Environmental Protection

## 1 General

### 1.1 Application

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to pollution prevention systems, as described in Ch 1, Sec 2, [6.8]:

**CLEANSHIP** or **CLEANSHIP-CEMS**

**CLEANSHIP SUPER()** or **CLEANSHIP SUPER()-CEMS**

**AWT-A** or **AWT-B** or **AWT-A/B**

**BWE**

**BWT**

**GWT**

**GWT-B**

**NDO-x days**

**OWS-x ppm**

**NOX-x%**

**SOX-x%**

**EGCS-SCRUBBER**

**SEEMP**

**ULEV**

**VCS**

## 2 Prevention of sea pollution

### 2.1 First annual survey

#### 2.1.1 Confirmation of no discharge period

During the first annual survey, the Surveyor collects the results of tests and measurements undertaken by the Shipowner according to Pt F, Ch 9, Sec 2, [4.2.2]. These results are used to confirm or modify the no discharge numeral appended to the notations **NDO-x days**.

#### 2.1.2 Audit

An onboard audit of the procedures, as required in Part F, Chapter 9, is done by the Surveyor in order to ascertain that the Master and crew are familiar with the ship's onboard procedures for preventing pollution and in order to check that the discharge records mentioned in Part F, Chapter 9 are properly completed.

### 2.2 Annual survey

#### 2.2.1 General

The survey is to include, as far as practicable:

- confirmation of the installation being in accordance with the plans. If modifications have been made, checking that these modifications are in accordance with approved documentation (for all additional class notations related to pollution prevention systems)
- confirmation that the IOPP certificate is valid (for **CLEANSHIP**, **CLEANSHIP SUPER** and **OWS-x ppm**)
- general examination of the most important components of the sewage treatment plant, the garbage treatment plant, the oil filtering equipment, the incinerators if fitted, the comminuters and grinders, the hazardous wastes recovery unit if fitted (for **CLEANSHIP** and **CLEANSHIP SUPER**)
- general examination of the holding tanks, including examination of a possible corrosion protection of the inside surfaces of the tanks which are to be in good condition (for **CLEANSHIP** and **CLEANSHIP SUPER**)
- verification of the satisfactory condition of the standard discharge connections for oil and wastewater (for **CLEANSHIP**, **CLEANSHIP SUPER**, **AWT-A**, **AWT-B**, **AWT-A/B** and **NDO-x days**)
- external examination and operating tests of the equipment and systems as required in Pt F, Ch 9, Sec 2 to Pt F, Ch 9, Sec 7 (for all additional class notations related to pollution prevention systems).

- confirmation that the hazardous wastes are properly stowed as specified in the garbage management plan (for **CLEANSHIP**, **CLEANSHIP SUPER** and **NDO-x days**).

For some pollution prevention system of [1.1.1], the survey is also to include, as far as practicable:

- ascertainment of the correct concentration of the disinfectant in the effluent (for **CLEANSHIP**, **CLEANSHIP SUPER**, **AWT-A**, **AWT-B**, **AWT-A/B**, **GWT** and **GWT-B**)
- ascertainment of possible concentration of other chemicals in the effluent (for **CLEANSHIP**, **CLEANSHIP SUPER**, **AWT-A**, **AWT-B**, **AWT-A/B**, **GWT** and **GWT-B**).

### 2.2.2 Review of records

The following records for the preceding 12 months are to be reviewed as necessary:

- oil record book (for **CLEANSHIP**, **CLEANSHIP SUPER** and **OWS-x ppm**)
- garbage record book (for **CLEANSHIP** and **CLEANSHIP SUPER**)
- records of ballast exchanges after international voyages (for **BWE** and **BWT**)
- ballast water record book (for **BWE** and **BWT**)
- sewage and grey water discharge book (for **CLEANSHIP**, **CLEANSHIP SUPER**, **GWT**, **GWT-B** and **AWT-A**, **AWT-B**, **AWT-A/B**)
- emissions record (for **CLEANSHIP SUPER**, **NOX-x%** and **SOX-x%**)
- results of the tests on effluents done by the Shipowner according to Pt F, Ch 9, Sec 2, [4.2.3] for any pollution prevention system of [1.1.1] (for **AWT-A**, **AWT-B**, **AWT-A/B**).

## 2.3 Class renewal survey

**2.3.1** The requirements given in [2.2] for annual surveys are to be complied with. In addition, for all additional class notations related to pollution prevention systems, the following is to be carried out:

- demonstration, under working conditions, of the correct functions of the most important components of the sewage treatment plant or AWT plant if fitted, the garbage treatment plant, the oil filtering equipment, the incinerators if fitted, the comminuters and grinders, the hazardous waste recovery unit if fitted
- ascertainment of the correct function of the alarms.

## 3 Prevention of air pollution

### 3.1 Annual survey

#### 3.1.1 Ozone depleting substances (CLEANSHIP, CLEANSHIP SUPER)

- a) A procedure for annual verification of the system and equipment condition by an authorised organisation is to be settled. The interval of this verification may be extended in case of predictive maintenance scheme approved by the Society.
- b) A procedure for weekly verification and maintenance is to be settled enabling to:
  - check the tightness of the circuits by satisfactory means (such as weighing or vessel pressure monitoring)
  - identify the location of possible leakage
  - carry out necessary corrective actions.

Record books tracing all the operations carried out on board the ship according to the procedures mentioned in the NOx Technical Code are to be kept on-board and updated after each intervention. They are to include in particular the following records:

- presence of leak and corrective action
- volume of substance recovered and indication of the storage location
- volume of substance recharged
- volume of substance consumed
- volume of substance disposed.

The survey is to include the following items:

- verification that the above procedures for annual and weekly checking of systems with ozone depleting substances are available on board
  - confirmation that appropriate entries are being made in the record book for ozone depleting substances
  - test of the proper operation of the leak detectors and related audible and visual alarms
- c) Review of ozone - depleting substance record book.

#### 3.1.2 NOx emission (CLEANSHIP SUPER, NOX-x%)

- The procedures for demonstrating compliance with NOx emission limits on board are given in the NOx Technical Code.
- During the annual survey, it is to be confirmed that the NOx emission control procedure is available on-board
- NOx emission records.

### **3.1.3 SO<sub>x</sub> emission (CLEANSHIP, CLEANSHIP SUPER, SOX-x%)**

Procedures are to be established to detail the maximum sulphur content in the fuel oil purchase orders, and to check the actual content of sulphur at the delivery of bunker.

In the case the actual sulphur content is checked by sampling testing and analysis, procedures are to be carried out in accordance with a recognised standard acceptable to the Society.

The fuel management procedures are to be established and followed as part of the certified ship management system of the ship.

Records on purchase orders and on type of checking carried out, including results, are to be kept on-board.

The survey is to include the following items:

- verification that the above procedures for defining, ordering and checking fuel oils for control of SO<sub>x</sub> emission are available on-board
- confirmation that fuel oil sulphur content records are available on-board
- emission record (when exhaust gas cleaning is provided (EGC)).

### **3.1.4 Shipboard incineration (CLEANSHIP, CLEANSHIP SUPER)**

The annual survey is to include the following items, when fitted:

- external examination of the incinerators and confirmation that such equipment operates satisfactorily
- test of the alarms, exhaust monitoring devices and emergency stop located outside the compartment.

### **3.1.5 Exhaust Gas Cleaning System-Scrubber (EGCS-SCRUBBER)**

The annual survey is to include the following items, when fitted:

- examination of the logbooks with regard to correct functioning of the Exhaust Gas Cleaning Systems, emissions monitoring and washwater monitoring systems
- confirmation that the approved Operating and Maintenance Instruction Manual is onboard
- confirmation that the Instrumentation, Control, Monitoring, and Safety equipment of each system unit are operating satisfactorily
- examination of emergency shutdown or bypass valves, remote operating valves, and machinery and equipment associated with processing or distribution of exhaust gases and, as far as practicable, testing of the emergency shutdown of the system
- examination and functional test of all tanks, piping, hoses, pumps, strainers, separators, filtration units, dosing systems, and equipment associated with processing of washwater, injection of reductant or collection of exhaust residues
- examination of drip trays, overflow arrangements, shielding or insulation installed for the protection of personnel or of the ship
- examination of electrical equipment associated with the operation or monitoring of Exhaust Gas Cleaning Systems
- confirmation that Personal Protective Equipment (PPE) and facilities are available onboard and maintained in good conditions
- external examination of all components including scrubber units, of insulation, etc., including foundations and attachments
- confirmation of correct operation of all rotating and reciprocating components, such as exhaust gas fans, water treatment pumps, dry handling conveyors, ventilation fans
- verification of the correct operation of all remotely operated or automatically controlled valves in the exhaust, water treatment or dry handling systems
- examination of the Exhaust Gas Cleaning System during working condition. Multi-mode SO<sub>x</sub> scrubbers are to be tested in all operational modes, as far as practicable.

## **3.2 Class renewal survey**

**3.2.1** The requirements given in [3.1] for annual surveys are to be complied with. In addition, the following is to be carried out:

- for **CLEANSHIP SUPER, NO<sub>x</sub>-x%** and **SOX-x%**, confirmation of the operation and calibration of the emissions analysers, if fitted
- for the Exhaust Gas Cleaning System (**EGCS-SCRUBBER**), the associated systems and monitoring equipment, the following is also to be carried out:
  - visual inspection of all washwater, water treatment pumps and reductant dosing pumps, including openings, for examination, as deemed necessary by the Surveyor
  - visual inspection of all bypass, mixing, isolating, shut-down or control valves in the exhaust, water treatment and dosing systems
  - visual examination and test of all mechanical, hydraulic and pneumatic control actuators and their power systems, as deemed necessary by the Surveyor
  - dock trials on control systems, in order to verify correct operation of the automatic functions, monitoring and alarms systems, safety systems, including override of system functions if provided, manual control and automatic changeover of designated machinery associated with the Exhaust Gas Cleaning Systems
- external examination and operating tests of the equipment and systems, as required in Pt F, Ch 9, Sec 2 to Pt F, Ch 9, Sec 7 (for all additional class notations related to pollution prevention systems).

### **3.3 Ultra-low emission vessel (ULEV)**

**3.3.1** At each annual and class renewal survey, the following is to be checked:

- proper operation of the NO<sub>x</sub> Control Diagnostic (NCD) and Particulate Control Diagnostic (PCD) systems, when fitted
- proper operation of the recording of the status of the engines related to the operations in the ULEV mode
- confirmation that no modification has been carried out without prior approval of the Society on the engines covered by the ULEV additional class notation. In case of replacement or modification of an engine, testing as per Pt F, Ch 9, Sec 8 may be required unless otherwise duly justified and documented by the engine's manufacturer.

### **3.4 Continuous emission monitoring system (CEMS)**

**3.4.1** At each annual and class renewal survey, the following is to be checked:

- confirmation that the waste discharge and air emission parameters required to be monitored and recorded are transmitted on a regular basis via a satellite communication system to a shipowner facility ashore
- confirmation that such information is made available to the Surveyor upon request.

## **4 Ship Energy Efficiency Management Plan (SEEMP)**

### **4.1 Intermediate and class renewal surveys**

#### **4.1.1 Onboard verification**

The onboard survey is to include the following items:

- a) verification that the implementation of the energy measures is properly recorded
- b) verification by sampling technique that the procedures to measure the data are properly implemented and that the measuring devices are properly maintained and/or calibrated
- c) verification that EEOI and other EnPIs defined in the planning phase, if any, are properly calculated from the collected data over the last 6 months of the ship's operations, and recorded
- d) verification that the SEEMP is onboard and that the record books are kept up to date.

## **5 VCS**

### **5.1 Annual survey**

**5.1.1** The Owner or his representative is to declare to the attending Surveyor that no significant modifications have been made without the prior approval of the Society.

**5.1.2** The annual survey is to include:

- an examination of the instruction manual to verify the layout of the complete system and confirm the correspondence to the actual system fitted on board
- a general examination of components of the system such as vapour piping (including manifold and hoses), cargo tank gauging equipment, cargo tank level alarms, vapour pressure alarms and vapour balancing, if any, to verify their satisfactory condition.

### **5.2 Class renewal survey**

**5.2.1** The requirements given in [5.1] for annual survey are to be complied with. Additionally, the following is to be carried out:

- a pressure test of the vapour piping, including manifold and hoses
- a check and test of the instrumentation (cargo tank gauging equipment, cargo tank level alarms, vapour pressure alarms)
- an inspection and test of the vapour balancing equipment, if any
- a running test of the system.

# Section 9 Refrigerating Installations

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to refrigerating installations, as described in Ch 1, Sec 2, [6.9]:

**REF-CARGO**

**REF-CONT**

**REF-STORE**

as well as the following specific notations:

**-PRECOOLING**

**-QUICKFREEZE**

**-AIRCONT**

## 2 Annual survey

### 2.1 General

2.1.1 The annual survey of refrigerating installations (plants and spaces) is to be carried out with the installation in running condition and, whenever possible, during unloading operations or without cargo in refrigerated spaces.

2.1.2 The refrigeration installation log-book (or other similar record) is to be made available to the Surveyor for examination of the records since the last survey, and checking any unusual consumption of refrigerant, breakdown or defective items.

2.1.3 Decks, bulkheads or ship sides adjacent to refrigerated spaces are to be checked as far as practicable in order to verify the absence of cold spots.

2.1.4 The Owner or his representative is to declare to the attending Surveyor that no significant modifications have been made to the installations that could affect the class notations without the prior approval by the Society.

### 2.2 Refrigerating plant

2.2.1 Refrigerating machines and related accessories, including compressors, condensers, pumps and piping are to be examined externally and in running condition. Insulation of insulated parts is to be checked for possible signs of humidity or wear. The tightness of the system is to be ascertained.

2.2.2 The electrical installation is to be generally examined, and the insulation resistance of the installation is to be checked as deemed necessary by the Surveyor.

2.2.3 If independent from the electrical installation of the ship, the generators supplying electrical power to the refrigerating installation are to be examined to the same extent as described in Ch 3, Sec 1, [3.3].

### 2.3 Refrigerated spaces

2.3.1 Refrigerated spaces are to be generally examined to ascertain the condition of:

- insulation lining; removable panels or covers may be dismantled for examination of insulation, as deemed necessary by the Surveyor
- hatch covers, doors, access panels (including gaskets and securing devices) and dampers of ventilation ducts
- air coils, coolers, fans, air ducts, brine piping systems and associated equipment; cleanliness of grids
- bilge wells
- protection of fans and other rotating machinery, battens for air circulation within the space.

### 2.4 Instrumentation and safety devices

2.4.1 Thermometers used for measurement of temperature in refrigerated spaces, air ducts and other elements of the installation are to be examined and checked for their accuracy. The Surveyor may require the calibration of one or more thermometers and one or more automation devices to be checked in his presence or, failing this, a certificate of calibration is to be presented to him.

**2.4.2** The following alarm and safety devices are also to be checked, as required or fitted:

- alarm and emergency shutdown devices
- CO<sub>2</sub> detectors, if any
- refrigerant leakage detectors
- access to spaces, with regard to possibilities of escape and prevention of personnel being trapped within spaces.

## **2.5 Notation -AIRCONT**

**2.5.1** The requirements of this item apply to installations assigned the notation **-AIRCONT**. They are additional to the requirements given in [2.1] to [2.4].

**2.5.2** The installation is to be visually examined and tested to verify that the controlled atmosphere system remains satisfactory. The survey is to include the following items:

- examination of voyage logs, records of controlled atmosphere zone air-tightness and calibration of instruments
- confirmation that an operating and safety manual is available on board, complete and duly endorsed by the officers responsible
- examination of controlled atmosphere zone sealing arrangements including cleats and hinges, pressure/vacuum valves, door locks, ventilation of adjacent spaces, warning notices
- test to design pressure of controlled atmosphere zones for air-tightness. Tests by ship's staff within one month prior to the survey may be accepted, based on a written report by the Master subject to visual inspection confirming the air-tightness.
- operation and performance test of the gas supply equipment, including controls, alarms, interlocks and safety devices
- examination and test of ventilation arrangements including fans as deemed necessary
- examination of electrical supply arrangements
- check of gas analysers, analysing equipment and calibration
- check of relative humidity sensors and calibration
- check of permanent and portable gas monitoring, including calibration, and of personnel safety equipment.

## **3 Class renewal survey**

### **3.1 General**

**3.1.1** The installation is to be surveyed out of operation in order to enable examinations in opened condition of certain items.

**3.1.2** After completion of these examinations, the installation is to be checked while cooling down from the ambient temperature to the lowest design temperature for the refrigerated spaces. The plant is to be examined for ability to maintain stable air temperatures and defrosting operation is to be checked.

### **3.2 Refrigerating plant**

**3.2.1** The equipment is to be dismantled to a sufficient extent to enable the following examinations:

- reciprocating compressors: examination of cylinders, valves, crankshaft, connecting rods, pistons, bearings and safety devices
- screw compressors, turbo compressors and pumps: parts subject to wear and tear; the equipment may not need to be opened up if log-book records and a running test show proper functioning.

**3.2.2** Prime movers of pumps, compressors and fans are to be examined to the same extent as required in Ch 3, Sec 3, [3] for similar equipment for the class renewal survey of machinery.

**3.2.3** Condensers and coolers are to be opened up for examination of tube plates, tubes and end covers. Condensers are to be pressure tested to 1,2 times the rated working pressure.

**3.2.4** Insulation of insulated parts (such as piping and pressure vessels) may need to be removed at random, to ascertain the condition of such parts and of the insulation itself.

**3.2.5** The electrical installation of the plant is to be examined and insulation tests checked.

**3.2.6** If independent from the electrical installation of the ship, the generators supplying electrical power to the refrigerating installation are to be examined to the same extent as described in Ch 3, Sec 3, [3.6].

**3.2.7** Sea connections to condenser circulating pumps are to be opened up and piping examined.

**3.2.8** Other equipment, such as oil separators on refrigerant systems, filters and dehydrators, are to be examined to the satisfaction of the Surveyor.

### **3.3 Refrigerated spaces**

**3.3.1** The lining and insulation in the refrigerated spaces may need to be partly removed for examination of its condition. The condition of the hull part under the insulation is then ascertained, as well as that of girders, meat rails, hooks and coil/cooler supports.

**3.3.2** Air coolers and coils are to be examined and pressure tested at the rated working pressure and at 1,2 times such pressure in the case of hydraulic test after repairs.

**3.3.3** Air cooler fans are to be examined and their prime movers are to be checked to the same extent as stated in [3.2.2].

**3.3.4** The electrical installation in the refrigerated spaces is to be examined and insulation tests checked.

**3.3.5** Defrosting and heating systems are to be examined to the satisfaction of the Surveyor.

### **3.4 Instrumentation and safety devices**

**3.4.1** Pressure relief valves and safety disks are to be checked. Discharge piping is to be examined with regard to integrity and non-obstructed flow.

### **3.5 Notation -AIRCONT**

**3.5.1** The requirements of this item apply to installations assigned the notation **-AIRCONT**. They are additional to the requirements given in [3.1] to [3.4].

**3.5.2** Air compressors, pressure vessels and other equipment are to be examined to the same extent as required in Ch 3, Sec 3, [3] for similar equipment for the class renewal survey of machinery.

**3.5.3** Each controlled atmosphere zone is to be subjected to an air-tightness test.

# Section 10 Navigation in Cold Environment

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.10]:

**ICE CLASS IA SUPER, ICE CLASS IA, ICE CLASS IB, ICE CLASS IC**

**ICE CLASS ID**

**YOUNG ICE 1, YOUNG ICE 2**

**ICE**

**COLD DI**

**COLD (H  $t_{DH}$ , E  $t_{DE}$ )**

**COLD CARGO**

## 2 ICE, ICE CLASS and YOUNG ICE notations

### 2.1

2.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to navigation in an ice environment, as described in Ch 1, Sec 2, [6.10]:

**ICE CLASS IA SUPER, ICE CLASS IA, ICE CLASS IB, ICE CLASS IC**

**ICE CLASS ID**

**YOUNG ICE 1, YOUNG ICE 2**

**ICE**

### 2.2 Class renewal survey

#### 2.2.1 Thickness measurements

Additional systematic thickness measurements are required in the areas where strengthening for navigation in an ice environment has been applied in accordance with the requirements in Part F, Chapter 8, as per Tab 1.

#### 2.2.2 Sea chests

During the bottom survey in dry condition which is to be carried out concurrently with the class renewal survey (see Ch 3, Sec 3, [2.1]), the specific arrangements related to sea chests protected against ice blocking, such as heating coil and cooling water discharge piping, are to be checked.

**Table 1 :**

Age of ship (in years at time of class renewal survey)		
age $\leq$ 5	5 < age $\leq$ 10	age > 10
	selected plates	all plates
		selected internal frames, stiffeners and stringers

## 3 COLD DI and COLD (H $t_{DH}$ , E $t_{DE}$ )

### 3.1 General

3.1.1 The requirements of this Article apply to ships which have been assigned the following additional class notations defined in Ch 1, Sec 2, [6.10.4]:

**COLD DI**

**COLD (H  $t_{DH}$ , E  $t_{DE}$ )**

## 3.2 Annual survey

3.2.1 The annual survey is to include:

- a) Availability on-board of the following documentation:
  - when the additional class notation **COLD DI** is assigned:
    - manual for de-icing procedures
  - when the additional class notation **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)** is assigned:
    - manual for de-icing procedures
    - stability manual including loading conditions with ice accretion.
- b) Electrical installations (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**):
  - general external examination of the arrangements for heated bridge windows and heated cargo control room windows, the de-icing systems for all escape doors and all main doors giving access to the deck area, the heating of bunker lines on deck, the heating of scupper lines, the heating of whistle, the heating of antennas and similar equipment
  - general external examination of the socket outlets provided close to each lifeboat to supply the heating system of lifeboat engine
  - test of the de-icing systems including indications and alarms, at random
  - test, as far as practicable, of the sequence of ventilation in loop in the air inlet compartment on air intakes for HVAC, machinery room and emergency generator room.
- c) Machinery installations:
  - general external examination and testing at random of the ventilation system for the machinery compartments (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general external examination of de-icing arrangements for:
    - sea inlets, overboard discharges (above the waterline and up to 1 m below the ballast waterline), air vent heads (for **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
    - air pipes and their automatic closing devices where fitted, sounding pipes and overflow pipes (for cooling water recirculation tanks and water ballast tanks), piping systems in exposed areas including ro-ro spaces, spray waterlines, exposed deck scuppers, washing lines and discharge lines (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination, as far as practicable, of the de-icing arrangements provided to the water ballast tanks adjacent to the shell plating and located totally or partly above the ballast waterline (for **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination, as far as practicable of the de-icing arrangements provided to other tanks subject to freezing (such as fresh water, fuel oil tanks) (for **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination of the specific heating arrangements provided for the cargo P/V valves (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - test of the de-icing systems including indications and alarms, at random (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**).
- d) Other equipment:
  - general external examination of the de-icing system on the exposed deck to allow the de-icing of the ship areas where the crew may have access during the normal operation of the ship (manoeuvring area, loading and unloading area, area around the access to the deckhouses, passageways, gangways, walkways) (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination of the specific arrangements for protection of equipment fitted on deck (foam monitors, davits, lifeboats, lifejackets lockers, winches, cranes, other deck machinery) and of helideck and its access (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination of personal protection and evacuation equipment which are to be suitable for the design temperature (for **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination of specific protection fitted on cargo valves and associated instrumentation, such as tarpaulins (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination of appropriate gratings and stairs (including escapes, access to lifeboats and to winching areas) for facilitation of circulation on exposed decks and of safety lines where provided (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination of heating arrangement for hydraulic oil system of deck machinery, where provided (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination of arrangements made to ensure 20°C in the accommodation and of arrangements made to control humidity, for HVAC plant (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - verification that sufficient hand tools or similar equipment for manual de-icing operations are available on-board and stored on the main deck at locations protected from accumulation of ice (for **COLD DI** and **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**)
  - general examination of navigation and communication equipment which are to be suitable for the design temperature (for **COLD (H t<sub>DH</sub>, E t<sub>DE</sub>)**).

### **3.3 Class renewal survey**

**3.3.1** The requirements given in [3.2] for annual survey are to be complied with. In addition, a test of the de-icing systems, including indications and alarms, is to be carried out.

## **4 COLD CARGO**

### **4.1 General**

**4.1.1** The requirements of this Article apply to ships which have been assigned the additional class notation **COLD CARGO**, as defined in Ch 1, Sec 2, [6.10.5].

### **4.2 Annual survey**

**4.2.1** The annual survey is to include:

- general examination of the heating system
- general examination of steam/thermal oil pipes insulation for the intended heaters
- general examination of the specific heating arrangements and insulation provided for valves serving the heaters
- general examination and verification of the temperature sensing/monitoring devices and alarms
- general examination of the de-icing arrangements provided for the water ballast tanks adjacent to the cargo tanks
- test of the de-icing systems including indications and alarms, at random
- general examination of the circulating arrangements provided for the liquid cargo in the tanks during heating-up.

### **4.3 Class renewal survey**

**4.3.1** The requirements given in Ch 5, Sec 7, [1.2] for annual survey are to be complied with. In addition, a test of all the de-icing systems, including indications and alarms, is to be carried out.

# Section 11 Protection against Chemical, Biological, Radiological and Nuclear Risk

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.14]:

**CBRN, CBRN-WASHDOWN**

**BIORISK MANAGED, BIORISK SECURED**

## 2 Chemical, biological, radiological or nuclear hazards

### 2.1 General

2.1.1 The requirements of this Article apply to ships which have been assigned one of the following additional class notation related to CBRN protection as described in Ch 1, Sec 2, [6.14.1]:

- **CBRN**
- **CBRN-WASHDOWN**

2.1.2 At each survey, the Owner or his representative is to declare to the attending surveyor that no significant modifications have been made to the installations that could affect the class notations without prior approval by the Society.

### 2.2 Annual survey

2.2.1 The CBRN operation manual is to be made available to the Surveyor and may be used as a basis for survey.

An examination of the log-books is to be carried out to verify the proper operation of the systems in the period subsequent to the last survey and measures taken to avoid repetition of any malfunctions and failures which have occurred during the same period.

2.2.2 The annual survey is to include:

- Examination and testing, as feasible, of airlocks, cleansing station(s) and CBRN protection plant(s)
- Examination of CBRN detection system, check number and location of each detector
- Verification that each opening in the citadel and shelter boundaries is provided with a closing appliance in working order and suitably marked
- Verification of remote indication, alarm and control functions at the CBRN control station
- Verification of ventilation non-return devices
- Verification of water traps or equivalent devices against air entrance
- Examination of CBRN ventilation system, including ducts, filters and dampers
- For ships assigned with the additional class notation **CBRN-WASHDOWN**: Examination of pre-wetting and wash down system, including piping, valves and nozzles.

### 2.3 Class renewal survey

2.3.1 The CBRN operation manual is to be made available to the Surveyor and may be used as a basis for survey.

An examination of the log-books is to be carried out to verify the proper operation of the systems in the period subsequent to the last survey and measures taken to avoid repetition of any malfunctions and failures which have occurred during the same period.

2.3.2 The class renewal survey is to include:

- Verification of gas tightness of citadel, shelter, airlock and cleansing station boundaries. For this purpose, the tested spaces are to be pressurized with all openings closed, and the air supply is to be isolated. It is then to be checked that the pressure can be maintained for 10 min in the tested space.
- Check of overpressure levels in the citadel with the collective protection ventilation system working. The required overpressure is to be held for at least 30 min. The test may be carried out with dummy filters in lieu of CBRN filters. This test may be carried out with the ventilation system fed by the main power source. Proper functioning the ventilation system when fed by the emergency power source is also to be checked.
- Check of gastightness of engine enclosure and associated supply and exhaust ducts, for engines with dedicated air supply
- Check of air conditioning capability under CBRN condition.

- Functioning test of the CBRN detection system. Each line is to be tested from the level of the detector, with means defined by the system supplier.
- For ships assigned with the additional class notation **CBRN-WASHDOWN**, functioning test of the pre-wetting and wash down system, including verification that all external surfaces are properly covered, verification of water drainage and verification of section valve remote operation.

### **3 Biological risk control**

#### **3.1 General**

**3.1.1** The requirements of this Article apply to ships which have been assigned the additional class notation **BIORISK MANAGED** or **BIORISK SECURED**, as defined in Ch 1, Sec 2, [6.14.2].

At each survey, the Owner or his representative is to declare to the attending surveyor that no changes or updates of the Outbreak Management Plan have been made since the last version that was submitted to the Society.

#### **3.2 BIORISK MANAGED**

##### **3.2.1 Annual and class renewal survey**

The annual and class renewal surveys are to include:

- verification that the Outbreak Management Plan is available on board
- verification that there is a register of PPEs and medical supplies required by the Outbreak Management Plan on board
- verification that the posters, signs and markings required by the Outbreak Management Plan are available on board
- verification that the operational records required by the Outbreak Management plan are available.

#### **3.3 BIORISK SECURED**

##### **3.3.1 Annual survey**

In addition to the requirements for **BIORISK MANAGED** given in [3.2.1], the annual survey is to include:

- verification that a means of monitoring body temperature is available on board
- verification that one totally enclosed stretcher and one totally enclosed wheelchair are available on board
- verification that a means of communication for the quarantine area is available onboard.
- verification that the filters installed in the ventilation systems as required in Pt F, Ch 10, Sec 6, [3.2.2] and Pt F, Ch 10, Sec 6, [3.3] have been replaced in accordance with manufacturer's specifications.

##### **3.3.2 Class renewal survey**

In addition to the requirements for annual survey given in [3.3.1], the class renewal survey is to include:

- functional testing of the ventilation arrangements for the quarantine area and for the accommodation spaces and normally manned control stations. It is to be checked that the ventilation system is functioning properly with the air filtration or alternative air disinfection system working
- functional testing of the means of monitoring the access to the quarantine area
- functional testing of the means of monitoring body temperature.

# Section 12 Manoeuvring, Mooring, Anchoring and Position Keeping

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.15]:

**HEADING CONTROL**

**SPM**

**DYNAPOS**

## 2 Heading control

### 2.1 General

2.1.1 The requirements of this Article apply to ships which have been assigned one of the following additional class notations **HEADING CONTROL-DS** or **HEADING CONTROL-IS** as described in Ch 1, Sec 2, [6.15.2].

### 2.2 Annual survey

2.2.1 At each annual survey the Owner or his representative is to declare to the attending Surveyor that no modifications have been made to the systems affecting the notations without prior approval by the Society.

### 2.3 Class renewal survey

2.3.1 At each class renewal survey a test is to be conducted in order to ascertain that the systems affecting the notations operate satisfactorily. This test is usually to be carried out during sea trials, as described in Pt F, Ch 11, Sec 2, [5.2].

## 3 SPM

### 3.1 Annual survey

3.1.1 The Owner or his representative is to declare to the attending Surveyor that no significant alterations have been made without the prior approval of the Society.

3.1.2 The annual survey is to include:

- a general examination of all components of the installation (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans) to verify their satisfactory condition
- an examination of the hull structures supporting and adjacent to the installation to verify that no deformations or fractures have developed.

### 3.2 Class renewal survey

3.2.1 The class renewal survey is to include:

- a close-up examination of all components of the installation (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans) to verify their satisfactory condition
- a close-up examination of the hull structures supporting and adjacent to the installation to verify that no deformations or fractures have developed.

Where deemed necessary by the Surveyor, non-destructive tests for measuring thickness deterioration or checking for fractures or other defects may be required.

## 4 DYNAPOS

### 4.1 Annual survey

**4.1.1** The Owner or its representative is to provide a testing program taking into account the FMEA proving trials to the satisfaction of the attending Surveyor.

The Owner or his representative is to declare to the attending Surveyor that no significant alterations have been made without the prior approval of the Society.

**4.1.2** The annual survey is to include:

- an examination of the log-books to verify the proper operation of systems in the period subsequent to the last survey and measures taken to avoid repetition of any malfunctions or failures which have occurred during the same period
- a general examination of visible parts of thrust units, including their prime movers
- a general examination of the electrical power system and switchboards
- a general examination of control, monitoring and alarm devices
- a running test of the installation, including random test by simulation of different alarms and relevant backup systems and switching modes
- confirmation that the DP system has been maintained in accordance with applicable parts of the Rules and is found in good working condition
- for ships granted with the additional class notation **DYNAPOS AM/AT-R** or **DYNAPOS AM/AT-RS**, test of all important systems and components to document the ability of the DP vessel to keep position after single failures associated with the assigned equipment class and to validate the FMEA and operations manual. As a minimum, there should be tests of the failures of position and environmental reference systems, thrusters, power generation and distribution systems, position controls and UPS's. Such tests are to be carried out at sea with the DP system in running condition. The results of these tests are to be recorded and kept on board.

Note 1: For ships granted with the - **DDPS** notation, reference is made to Ch 1, Sec 2, [6.15.5] and Pt F, Ch 11, Sec 5, [11] : tests to be carried out at sea may be performed by ship's crew without attendance of a Surveyor and will be reviewed digitally by a Surveyor.

- verification that DP system tests carried out and results are recorded and kept on board.

**4.1.3** Every time a defect is discovered and corrected or an accident occurs which affects the safety of the DP vessel, or whenever significant repairs or alterations are made, a survey is to be carried out.

After such survey, tests are to be carried out to demonstrate full compliance with the applicable provisions of the Rules, as necessary.

The type of tests carried out and results are to be recorded and kept on board.

### 4.2 Class renewal survey

**4.2.1** In general, the class renewal survey consists of the checks detailed in [4.2.3] to [4.2.6]. However, a specific program of the class renewal survey prepared by the Owner and taking into account the maintenance procedures of the Manufacturers of the system is to be submitted to the Society prior to the survey.

**4.2.2** The Owner is to confirm that any modification to the software is fully documented and properly recorded.

**4.2.3** Prime movers of thrust units, electrical installations and electric power generators are to be surveyed and tested to the same extent as required in Ch 3, Sec 3, [3] for similar equipment for the class renewal survey of machinery.

**4.2.4** During the bottom survey in dry condition which is to be carried out concurrently with the class renewal survey (see Ch 3, Sec 3, [2.1]), the thrust units are to be generally examined. Other checks are to be carried out, such as taking clearances, examination of the orientation device or variable pitch system, if any, verifying tightness devices, examination of results of lube oil analysis for detection of possible deterioration of internal gears and bearings. Dismantling of internal parts may be required if the above examinations are not satisfactory.

**4.2.5** Sensors and position reference systems are to be tested to check their accuracy. Failure of sensors is to be simulated in order to check the related alarm system and switching logic. Switch over to the different reference systems is to be checked.

**4.2.6** A complete test of all systems and components and the ability to keep position after single failures associated with the assigned equipment class is to be carried out. The type of tests carried out and results should be recorded and kept on board. The operational tests are to include:

- test of each thrust unit at different loads, pitches and speeds, and check of monitoring devices
- test of the thrust controls in the different available modes (automatic, semi-automatic, manual), and the switch over between the different modes
- test of the different alarms and safety systems, using simulated conditions as necessary
- test of power supply failure and verification of intended functioning in such cases
- final test to verify the capacity of the system to keep the ship in the intended position and maintain the heading, with related alarm and monitoring devices. The accuracy of the system is to be checked and compared with previous results for evaluation of drift
- test of the power management system.

# Section 13 Cargo Operation, Securing and Safety

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.16]:

**CARGOCONTROL**

**EVOG**

**PaRoll1** and **PaRoll2**

## 2 CARGOCONTROL

### 2.1 General

2.1.1 The requirements of this Article apply to ships which have been assigned the following additional class notation **CARGOCONTROL** as described in Ch 1, Sec 2, [6.16.5].

### 2.2 Annual survey

2.2.1 The Owner or his representative is to declare to the attending Surveyor that no significant modifications have been made without the prior approval of the Society.

2.2.2 The annual survey is to include:

- a general examination of the items of equipment regarding remote control of operations and gauging/alarms provided for all those parameters that are required to be kept under control to verify their satisfactory condition
- a running test which may be also performed by a spot check method.

### 2.3 Class renewal survey

2.3.1 The requirements given in [2.2] for annual survey are to be complied with. Additionally, the following is to be carried out:

- a check and test of the instrumentation fitted to the components of the system
- an overall running test of the system.

## 3 EVOG

### 3.1 General

3.1.1 The requirements of this Article apply to ships which have been assigned the following additional class notation **EVOG** as described in Ch 1, Sec 2, [6.16.12].

### 3.2 Annual survey

3.2.1 The Owner or his representative is to declare to the attending Surveyor that no significant modifications have been made without the prior approval of the Society.

3.2.2 The annual survey is to include:

- a general examination of the charging stations with a visual inspection of the safety measures and functions related to the recharging area (e.g. visual check on the charging stations and their cable assemblies, fire safety measures and alarms, ventilation, possibility of disconnection of the charging stations, ...)
- verification that the charging equipment, cables and sockets are maintained according to the maintenance plan
- verification of proper working of alarms involving defaults and malfunctions related to the charging stations and cable assemblies
- examination and testing, as feasible at random, of the fixed fire detection and fire alarm system
- checking of portable thermal imaging camera, fire blanket and water fog applicators and confirmation that they are stored in the appropriate location

- in case the recharging area is located on the weather deck, the following items are to be checked with respect to the fixed water monitors covering this area:
  - general examination of all parts of the water monitor system (pumps, piping system, valves and other fittings)
  - checking for proper operation of the system, including local manual control and remote control
  - general examination of foundations of water monitors.

### **3.3 Class renewal survey**

**3.3.1** The requirements given in [3.2] for annual survey are to be complied with. In addition, the class renewal survey is to include:

- a comprehensive test of indications and alarms
- verification of the quality of the power supply intended for electric vehicles (EV) charging
- verification if the charging stations maintenance is performed according to the manufacturers' recommendation
- examination of the fire-extinguishing system and fire detection system as applicable in accordance with the relevant requirements given in Ch 3, Sec 3, [3.8]
- operational testing and internal examination of the pumps feeding the water monitors covering recharging areas on weather deck, if provided
- testing of the electrical installation to the same extent as required in Ch 3, Sec 3, [3] for similar equipment for the class renewal survey of machinery
- testing of the cooling installation of the charging station.

## **4 PaRoll1 and PaRoll2**

### **4.1 Annual survey**

**4.1.1** The annual survey is to include confirmation of the availability onboard of the operation guidance required by NR667, Sec 1, [4].

# Section 14      Additional Notations for Hull Structure Assessment

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.18]:

**STRENGTHBOTTOM**

**GRABLOADING**

**GRAB [X]**

## 2 STRENGTHBOTTOM

### 2.1 Dry-docking survey

2.1.1 The reinforced area of bottom plating and internal associated structures are to be visually examined for possible deformations, fractures or other damage. If deemed necessary, thickness measurements may be required.

## 3 GRABLOADING and GRAB[X]

### 3.1 Class renewal survey

3.1.1 The reinforced area of inner bottom plating, lower part of hopper tank sloping plating and transverse lower stool plating and adjacent associated structures, as applicable, are to be visually examined for possible deformations, fractures or other damage. If deemed necessary, thickness measurements may be required.

# Section 15      Electric Propulsion or Electric Power Supply

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.20]:

**BATTERY SYSTEM**

**ELECTRIC HYBRID**

**HYBRID MECHANICAL PROPULSION**

## 2 BATTERY SYSTEM

### 2.1 General

2.1.1 The requirements of this Article apply to ships which have been assigned the additional class notation **BATTERY SYSTEM** as defined in Ch 1, Sec 2, [6.20.1].

### 2.2 Annual survey

2.2.1 The annual survey is to include:

- general examination of the battery pack(s)
- general examination of the battery monitoring system
- general examination of the battery support system
- general examination of the battery compartment, including visual check of the safety measures and functions related to battery spaces, i.e. battery installation, ventilation, fire safety measures and alarms
- check of the electrolyte level and pH level
- check of State of health (SOH) of battery system according to the Manufacturer's specification and verification that the battery capacity has been regularly recorded and complies with the parameters specified by the Manufacturer
- test of sensor and alarm associated to the battery at random
- undertaking of measurement of insulation of battery packs
- additional checks when some specific part of battery is or has been replaced (e.g. battery cells, BMS) according to the Manufacturer specification and to the satisfaction of the Surveyor.

### 2.3 Class renewal survey

2.3.1 The requirements given in [2.2.1] for annual survey are to be complied with.

In addition:

- a comprehensive test of indication and alarms is to be carried out
- the traceability of cells replacement is to be checked
- the traceability of software modification is to be checked
- a battery capacity (State of Health - SOH) test is to be witnessed when:
  - release of flammable or toxic gases during battery operation was identified (e.g. hydrogen for lead-acid batteries)
  - loss of battery might jeopardize manoeuvrability of the ship.

## 3 ELECTRIC HYBRID

### 3.1 General

3.1.1 The requirements of this Article apply to ships which have been assigned the additional class notation **ELECTRIC HYBRID** as defined in Ch 1, Sec 2, [6.20.2].

## **3.2 Annual survey**

**3.2.1** The survey is to include:

- verification of proper working of monitoring systems
- verification of proper working of alarms and defaults and related functions and/or interfacing to the other ship systems
- disconnection of the ESS in different operating modes, and automatic start of stand by source, as necessary
- test of the fire detection of the battery compartment
- test of the gas detection system of the battery compartment
- examination of the fire-extinguishing system of the battery compartment as applicable in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4]
- verification that accessibility for common maintenance and devices for battery overhaul, if any, are maintained.

**3.2.2** In addition to the requirements [3.2.1], for **PM** mode, the survey is to include:

- increasing load steps, as far as practicable. The ESS is to deliver power to the grid, to compensate for the load steps. In case of continuous load, the load is to be gradually transferred to the running diesel engine. The load is to be shared equally between the diesel engines (see Pt C, Ch 2, Sec 4, [2.2.5])
- additional increasing load steps, with load dependant start of a stand-by main generating set activated, as far as practicable.

**3.2.3** In addition to the requirements of [3.2.1], for **PB** mode, the survey is to include:

- failure of one generator and automatic connection of the ESS
- failure of one generator and ESS autonomy measurement (starting of the stand by generator is blocked)
- automatic start of a stand by source in case of failure of the ESS or low state of charge of the ESS.

**3.2.4** In addition to the requirements of [3.2.1], for **ZE** mode, the survey is to include:

automatic start of a stand by source in case of failure of the ESS or low state of charge of the ESS.

## **3.3 Class renewal survey**

**3.3.1** In addition to the requirements given in [3.2.1] for annual survey the following requirements are to be complied with:

- verification of the quality of the power supply in the different modes
- examination of the fire-extinguishing system as applicable in accordance with the relevant requirements given in Ch 3, Sec 3, [3.8].

**3.3.2** In addition to the requirements of [3.3.1], for **PM** mode, the survey is to include:

confirmation of the capacity of the batteries by verification of the proper operation of the ESS during 6 hours at least in normal working condition; however, where proper record is maintained, consideration may be given to accepting recent records effected by the ship's personnel. The ESS state of charge is not to be less than 80% at the end of the 6 hours period. A load analysis curve corresponding to this period is to be submitted for information. This document is to detail the total electrical production on board, the main generating sets electrical production and the ESS electrical production (with charging and discharging cycles).

**3.3.3** In addition to the requirements of [3.3.1], for **ZE** mode, the survey is to include:

load discharge test with ESS autonomy measurement up to ESS state of charge low level.

**3.3.4** In addition to the requirements of [3.3.1], for **PB** and **ZE** modes, the survey is to include:

ESS charging test, with evaluation of charging current and time for complete charging of the batteries (to reach full charge, just after a full discharge, in the conditions defined by the load balance).

## **4 Hybrid mechanical propulsion**

### **4.1 General**

**4.1.1** The requirements of this Article apply to ships which have been assigned the additional class notation **HYBRID MECHANICAL PROPULSION**, as defined in Ch 1, Sec 2, [6.20.4].

### **4.2 Annual survey**

**4.2.1** The annual survey is to include:

- confirmation of proper working of alarms and defaults and related functions and/or interfacing to the other ship systems
- test of manual switch from diesel propulsion mode to electric propulsion mode (PTI Fully electric mode and PTI Booster mode, if available)
- test of manual switch from electric propulsion mode to diesel propulsion Mode
- test of transfer of control between the different control positions.

### **4.3 Class renewal survey**

**4.3.1** In addition to the requirements of [4.2.1], the class renewal survey is to include:

- test of automatic switch from electric propulsion mode to diesel propulsion.

## Section 16 Additional Notations for Fire Protection

### 1 General

#### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.19]:

**EFP-M, EFP-AMC**

**ECFP-1, ECFP-2, ECFP-3**

**COVENT**

### 2 Enhanced fire protection

#### 2.1 General

2.1.1 The requirements of this Article apply to ships which have been assigned the additional class notation **EFP-M** or **EFP-AMC**, as defined in Ch 1, Sec 2, [6.19.1].

#### 2.2 Annual survey

2.2.1 The annual survey is to include a verification that the insulation applied in way of following items is found in satisfactory condition:

- surfaces of engines, boilers, steam, thermal oil and exhaust gas lines, silencers, exhaust gas boilers and turbochargers or other equipment where hot surfaces above 220 °C may be expected, with the engines or concerned equipment under normal operating conditions are properly insulated
- surfaces, having temperature exceeding 60°C, with which the crew are likely to come into contact during operation are to be suitably protected or insulated.

In case of doubt the surveyor may require a thermal imaging scanning to be performed in accordance with the requirements of Pt F, Ch 11, Sec 15 [5].

### 3 Enhanced cargo fire protection on container ships

#### 3.1 General

3.1.1 The requirements of this Article apply to ships which have been assigned the additional class notations **ECFP-1**, **ECFP-2**, or **ECFP-3**, as defined in Ch 1, Sec 2, [6.19.2].

#### 3.2 Annual survey

3.2.1 The annual survey is to include:

- a) Checking of fire-fighter's outfits, breathing apparatuses and portable thermal imaging camera and confirmation that they are stored in the appropriate locations
- b) Confirmation that the required supply of compressed air for breathing apparatuses is provided and examination of the arrangements for the air compressor(s) and air piping system

3.2.2 In addition to the requirements of [3.2.1], for ships granted with **ECFP-2** or **ECFP-3** notation, the survey is to include:

- a) Water monitors covering the cargo stowage area on deck:
  - general examination of all parts of the water monitor system (pumps, piping system, valves and other fittings)
  - checking for proper operation of the system, including local manual control
  - general examination of foundations of water monitors.
- b) In the cargo holds covered by the water spray system below hatch covers, examination of the water-spray system in accordance with the relevant requirements given in Ch 3, Sec 1, [3.4.2] item d).

- c) In the cargo holds covered by the flooding system for the cargo holds:
  - examination of the system, including piping, nozzles and distribution valves
  - confirmation that cargo hold sea water level sensors are operational and that high and high high level alarms are satisfactory
  - examination of the drainage arrangements
- d) General examination of all parts, as far as practicable and visible, of the water-spray system for the protection of the accommodation block, and of scuppers and freeing ports for water drainage from deck surfaces
- e) Checking that the means of remotely closing the accommodation block ventilation inlets and the remote controls for the cargo hold power ventilation are in working order.

### **3.3 Class renewal survey**

**3.3.1** In addition to the requirements of [3.2.1], the class renewal survey is to include:

- a) Examination and test of prime movers of the air compressor for refilling of air bottles of breathing apparatuses.

**3.3.2** In addition to the requirements of [3.3.1] and [3.2.2], the class renewal survey for ships granted with **ECFP-2** or **ECFP-3** is to include:

- a) Operational testing and internal examination, as required by the Surveyor, of the relevant pumps for the following systems:
  - water monitors covering the cargo stowage area on deck
  - water-spray system below hatch cover
  - flooding system for the cargo holds
  - water-spray system for the protection of the accommodation block
- b) Testing of the means of remotely closing the accommodation block ventilation inlets and remote control for the cargo hold power ventilation.

## **4 COVENT**

### **4.1 Annual survey**

**4.1.1** The Owner or his representative is to declare to the attending Surveyor that no significant modifications have been made without the prior approval of the Society.

**4.1.2** The annual survey is to include a general examination of components of the system such as ventilation piping and fans.

### **4.2 Class renewal survey**

**4.2.1** The requirements given in [4.1] for annual survey are to be complied with. Additionally, the following is to be carried out:

- an inspection of the components of the system to the same extent as required in Ch 3, Sec 3, [3] for similar equipment for the class renewal survey of machinery
- a running test of the system.

# Section 17 Additional Notations for Computer Based Systems and Cyber Security

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations related to cyber security as described in Ch 1, Sec 2, [6.21] and smart systems as described in Ch 1, Sec 2, [6.23]:

**CYBER MANAGED**

**CYBER RESILIENT**

**CYBER SECURE**

**SMART()**

## 2 CYBER

### 2.1 General

2.1.1 The surveys for maintaining the additional class notations **CYBER MANAGED**, **CYBER RESILIENT** and **CYBER SECURE** are to be systematically recorded along with all cyber security events, as set out in the Policy document: date, actors, tests performed, results and conclusions.

2.1.2 The requirements for the maintenance of these notations are provided in [2.2], [2.3] and [2.4], and, in addition, in NR659 Chapter 6.

### 2.2 Annual surveys

#### 2.2.1 Documents

Confirmation from Cyber Security Responsible, that any modification carried out on the approved documents as listed in NR659 has been declared to the Society.

#### 2.2.2 Surveys

The annual survey is to confirm that:

- the Cyber Handbook present on board is the up to date and approved
- Cyber Security events are logged
- crew cyber training is logged
- up to date and approved Cyber Policy is printed and available on board
- during the interview by the Surveyor, the Person in charge of Cyber is able to answer the questions related to crew training described in the Cyber Policy
- during the interview by the Surveyor, the person in charge of the equipment mentioned in the Cyber Handbook is aware of the monitoring procedures described in the document and knows how to implement the procedures
- during the interview by the Surveyor, the relevant crew demonstrates a complete understanding of the equipment maintenance procedures described in the Cyber Handbook for the equipment they use regularly
- during the interview by the Surveyor, the relevant crew demonstrates that they fully understand the incident response procedures described in the Cyber Handbook for the equipment they use on a daily basis.

### 2.3 Intermediate surveys

#### 2.3.1 Documents to be updated

Regarding Level 3 equipment only, the following documents are to be updated:

- Cyber Risk Assessment and Criticality Assessment
- Cyber Inventory (system identification part)
- Cyber Handbook, reflecting procedures only for the critical updated systems.

#### 2.3.2 Evidences to be submitted

Evidence of implementation of cyber security rules (from the Policy), crew training (as described in Policy), maintenance procedures (from the Handbook) and incident response procedures (from the Handbook) must be provided.

### **2.3.3 Surveys**

In addition to the requirements given in [2.2.2] for annual surveys, the intermediate survey is to include:

- confirmation that, during the interview, the person in charge of Cyber demonstrates awareness on Cyber Policy and its implementation
- confirmation that, during the interview, the person in charge of Cyber answers the questions related to the responsibilities described in the Policy
- confirmation that any anti-virus usage and update is in accordance with the Cyber Policy
- confirmation that, during the interview, the person in charge of an equipment present in the Handbook is aware of the remote access monitoring procedures described in the Handbook and knows how to implement them.

## **2.4 Class renewal surveys**

### **2.4.1 Documents to be updated**

The following documents are to be updated:

- Cyber Risk Assessment.

Regarding Level 2 and Level 3 equipment only, the following documents are to be updated:

- Cyber Inventory (system identification part).

### **2.4.2 Evidences to be submitted**

Evidence of implementation of cyber security rules (from the Policy), crew training (as described in Policy), maintenance procedures (from the Handbook) and incident response procedures (from the Handbook) must be provided.

### **2.4.3 Surveys**

In addition to the requirements given in [2.2.2] for annual survey and in [2.3.3] for intermediate survey, the class renewal survey is to include:

- confirmation that the password policy present in the Policy is effectively implemented on board
- confirmation that, during the interview, the person in charge of an equipment present in the Handbook is aware of the wireless monitoring procedures described in the Handbook and knows how to implement them
- confirmation that, during the interview, the relevant crew demonstrates their complete understanding of the software maintenance procedures described in the Handbook for the equipment they use on a daily basis.

## **3 SMART( )**

### **3.1 Application**

**3.1.1** The present Article defines the requirements for the maintenance of the additional class notation **SMART( )**.

**3.1.2** The applicable requirements for the maintenance of the additional class notations which are referred to in NR675 are prerequisites for the maintenance of the notations **SMART(Hx)**, **SMART(Mx)**, **SMART(MH2)**, **SMART(Nx)**, **SMART(EnEx-CII)**, **SMART(EnE2)**, **SMART(X2)** and **SMART(L2)**.

**3.1.3** The annual and class renewal surveys applicable to the Computer Based Systems and the Software Registry, in particular, are to be completed as defined in Ch 3, Sec 1, [3.3.3] and in Ch 3, Sec 3, [3.6.12] respectively.

**3.1.4** In addition to requirements of [3.1.2] and [3.1.3], the maintenance of **SMART(MHx)**, **SMART(EnEx)**, **SMART(Lx)** and **SMART(Xx)** is to comply with the applicable requirements of [3.2] and [3.3].

### **3.2 Annual surveys**

**3.2.1** During the annual survey applicable to smart group **3**, as witnessed by a Surveyor, the SDS (Shore Digital Solution) is to be operated by a representative of the Shipowner to demonstrate:

- transfer of data between the ODS (Onboard Digital Solution) and the SDS, checking the results in the interface of SDS
- visualisation and reporting features as required for ODS, where these features are only available in the SDS
- availability of the visualisation dashboards and/or reports generated by the SDS in its interface based on the data relevant to the operation in the past 12 months

In addition to the functional checks the annual survey for smart group **3** includes checking the following items:

- availability of the valid service agreement between the Shipowner and the smart service supplier
- availability of the user manual and the Type Approval Certificate.

### **3.2.2 SMART(MHx)**

The annual survey for **SMART(MHx)** includes checking the following items:

- reports generated by the smart system during the last 12 months
- maintenance records for the entries concerning hardware repair, maintenance or replacement of equipment or components
- availability of the user manual
- maintenance and calibration records for the connected measurement instrumentation.

### **3.2.3 SMART(EnEx)**

The annual survey for **SMART(EnEx)** includes checking the following items:

- reports defined in NR675, Sec 5, [2.4.1] items a), b) and c) generated during the last 12 months
- maintenance records for the entries concerning hardware repair, maintenance or replacement of equipment or components
- availability of the user manual
- maintenance and calibration records for the connected measurement instrumentation.

Additional requirements for complementary notations **-Em**, **-T**, **-LIT**, **-S**, **-W** and **-CII** are defined in [3.2.4] to [3.2.9].

### **3.2.4 SMART(EnEx-Em)**

In addition to the scope of the annual survey defined in [3.2.3], the annual survey for the complementary class notation **-Em** includes checking, as a minimum the following items:

- reports generated for emission performance indicators during the last 12 months.

### **3.2.5 SMART(EnEx-T)**

In addition to the scope of the annual survey defined in [3.2.3], the annual survey for the complementary class notation **-T** includes checking, as a minimum the following items:

- records of energy consumption assigned to the loading conditions under which the ship sailed in the past 12 months.

### **3.2.6 SMART(EnEx-LIT)**

In addition to the scope of the annual survey defined in [3.2.3], the annual survey for the complementary class notation **-LIT** includes checking, as a minimum the following items:

- records of loading conditions under which the ship sailed in the past 12 months with the corresponding energy efficiency performance indicators.

### **3.2.7 SMART(EnEx-S)**

In addition to the scope of the annual survey defined in [3.2.3], the annual survey for the complementary class notation **-S** includes checking of the following items:

- three latest voyage reports, which are to incorporate the planned and the actual energy efficiency parameters established.

### **3.2.8 SMART(EnEx-W)**

In addition to the scope of the annual survey defined in [3.2.3], the annual survey for the complementary class notation **-W** includes checking of the following items:

- three latest voyage reports by comparing against the relevant surface weather analysis reports.

### **3.2.9 SMART(EnEx-CII)**

In addition to the scope of the annual survey defined in [3.2.3], the annual survey for the complementary class notation **-CII** includes checking of the following items:

- list of alarms generated by the CII ODS for the discrepancies between the manual and automatic entries.

### **3.2.10 SMART(Lx)**

The annual survey for **SMART(Lx)** includes checking the following items:

- confirm that the electronic record keeping covered by the notation is in place
- confirm that the version of the electronic record keeping software corresponds to the Type Approval Certificate
- availability of the user manual
- check that the backup storage is operational, if applicable.

### **3.2.11 SMART(Xx)**

The annual survey for **SMART(Xx)** includes checking of the following items:

- reports generated by the smart system during the last 12 months
- maintenance records for the entries concerning hardware repair, maintenance or replacement of equipment or components
- availability of the user manual.
- maintenance and calibration records for the connected measurement instrumentation

### 3.3 Class renewal survey

**3.3.1** In addition to the scope of the annual survey as defined in [3.2.1], the class renewal survey applicable to Smart group 3 is to include checking the SDS for the visualisation and reporting features as required for ODS, where these features are only available in the SDS. During a test witnessed by a Surveyor, the SDS is to be operated by a representative of the Shipowner.

#### 3.3.2 SMART(MHx)

In addition to the scope of the annual survey defined in [3.2.2], the class renewal survey for **SMART(MHx)** includes the following items:

- consistency check of parameter trends with the recent operation of the equipment. Consistency check is completed by extracting data for a period of 1 to 12 months in a readable format for a review by a Surveyor of the Society. This may include, but not limited to, raw time series, descriptors, diagnostic assessments selected at the discretion of a Surveyor. The preferred format is a report or a non-encrypted delimited text file easily readable on a PC
- functional test by generating a recommended maintenance profile
- functional test by generating a condition report for the list of equipment considered in the scope of the notation
- functional test by generating a condition report in a test mode with a simulated introduction of incipient failures. This condition report is to be used to compare the results to a corresponding pre-calculated test case.

#### 3.3.3 SMART(EnEx)

In addition to the scope of the annual survey defined in [3.2.3], the class renewal survey for **SMART(EnEx)** includes the following items:

- consistency check between the SEEMP and the reports defined in NR675, Sec 5, [2.4.1] items a), b) and c) for a period of 12 months
- general examination of the list of time series with uptime history and source equipment
- functional test by generating recommended performance profile for the latest operational conditions typical for the ship's trade in the last 12 months
- functional test by simulating energy consumption and emissions for a laden voyage and for a port activity and comparing the results to an equivalent profile recorded during the last 12 months.

Additional requirements for complementary notations **-Em**, **-T**, **-LIT**, **-S**, **-W** and **-CII** are defined in [3.3.3] to [3.3.8].

#### 3.3.4 SMART(EnEx-EM)

In addition to the scope of the class renewal survey defined in [3.3.3], the class renewal survey for the complementary class notation **-Em** includes the following items:

- functional test by estimating an emission performance indicator for three last loading conditions under which the ship sailed in the preceding 12 months.

#### 3.3.5 SMART(EnEx-T)

In addition to the scope of the class renewal survey defined in [3.3.3], the class renewal survey for the complementary class notation **-T** includes the following items:

- functional test by estimating the energy consumption for three last loading conditions under which the ship sailed in the preceding 12 months.

#### 3.3.6 SMART(EnEx-LIT)

In addition to the scope of the class renewal survey defined in [3.3.3], the class renewal survey for the complementary class notation **-LIT** includes the following items:

- consistency check of three loading conditions under which the ship sailed in the preceding 12 months with a focus on the corresponding energy efficiency performance indicators and on the compliance to the intact stability and hull girder criteria
- functional test by generating an optimized stowage plan for the last laden voyage.

#### 3.3.7 SMART(EnEx-S)

In addition to the scope of the class renewal survey defined in [3.3.3], the class renewal survey for the complementary class notation **-S** includes the following items:

- consistency check of three latest voyage reports, which is to incorporate the planned and the actual energy efficiency parameters established
- functional test by generating an optimized voyage plan for the last laden voyage
- if the smart system automatically transfers the route to the ship's ECDIS: functional test for the automatic display of the optimized voyage plan in ECDIS in both planning mode and voyage execution mode with a thorough examination of the safety contour alerts produced by the ECDIS in relation to the route

### **3.3.8 SMART(EnEx-W)**

In addition to the scope of the class renewal survey defined in [3.3.3], the class renewal survey for the complementary class notation **-W** includes the following items:

- consistency check of onboard procedures for managing the weather routing information to confirm that the weather routing system is regularly updated with the surface analysis information
- functional test by generating an optimized ocean voyage plan
- if the smart system automatically transfers the route to the ship's ECDIS: functional test for the automatic display of the optimized voyage plan in ECDIS in both planning mode and voyage execution mode with a thorough examination of the safety contour alerts produced by the ECDIS in relation to the route.

### **3.3.9 SMART(EnEx-CII)**

In addition to the scope of the class renewal survey defined in [3.3.3], the class renewal survey for the complementary class notation **-CII** includes the following items:

- items in the scope of the annual survey as per [3.2.9]
- functional test of CII ODS (Onboard Digital Solution) by completion of entries for one day.

### **3.3.10 SMART(Lx)**

In addition to the scope of the annual survey defined in [3.2.10], the class renewal survey for **SMART(Lx)** includes checking that the list of authorised users on board is consistent with the Role Based Access Control defined in the user manual.

### **3.3.11 SMART(Xx)**

In addition to the scope of the annual survey defined in [3.2.11], the class renewal survey for **SMART(Xx)** includes the following items:

- consistency check of the list of time series with uptime history and source equipment
- functional test by generating a report relevant for the onboard process supported by the smart system.

## Section 18

## Additional Notations for Corrosion Protection

### 1 General

#### 1.1

**1.1.1** The requirements of this Section apply to ships which have been assigned the additional service feature **CPS(WBT)**, as defined in Ch 1, Sec 2, [4.16.11] or one of the following additional class notations related to corrosion protection, as described in Ch 1, Sec 2, [6.24]:

**CPS(COT)**

**CPS(MFT)**

**CPS(VSP)**

**CPS(WBT)**

### 2 Annual survey

#### 2.1 All notations

**2.1.1** The annual survey is to include:

- verification that the coating technical file is kept onboard
- verification that the coating is maintained and repaired in accordance with the coating technical file.

# Section 19 Other Notations

## 1 General

### 1.1

1.1.1 The requirements of this Section apply to ships which have been assigned one of the following additional class notations described in Ch 1, Sec 2, [6.25]:

**ACCESS**

**HEL**

**OHS**

**OAS**

## 2 Permanent means of access (ACCESS)

### 2.1 Annual survey, intermediate survey and class renewal survey

#### 2.1.1 General conditions

Visual examination of following parts of permanent means of access is to be carried out in conjunction with surveys of spaces where the notation **ACCESS** is assigned:

- visual examination for signs of corrosion
- examination for satisfactory condition of the marking (e.g. strip, arrows, non-slip surfaces)
- examination of the location lighting where the permanent mean of access is fitted
- examination for satisfactory condition of rails, stanchions, hand rails and other guard rails.

## 3 Helideck (HEL)

### 3.1 Application

3.1.1 The requirements of this Article apply to ships which have been assigned the additional class notation **HEL**, as defined in Ch 1, Sec 2, [6.25.3].

### 3.2 Annual surveys

3.2.1 The Society considers that as a minimum these following issues are to be examined during the periodic surveys to confirm that there has been no alteration or deterioration in the condition of the helicopter landing area:

- a) The general examination of the physical characteristics of the helideck is to include:
  - the dimensions as measured
  - the declared D-value
  - the deck shape, and
  - the scale drawings of deck arrangement.
- b) The general examination of the preservation of obstacle-protected surfaces is to include:
  - the minimum 210° Obstacle Free Sector (OFS) surface
  - the 150° Limited Obstacle Sector (LOS) surface, and
  - the minimum 180° falling 5:1 gradient surface with respect to significant obstacles.

Note 1: If one or more of these surfaces is/are infringed due, for example, to the proximity of an adjacent installation or vessel, an assessment is to be made to determine any possible negative effect which may lead to operating restrictions.

- c) The general examination of the marking and lighting is to include:
  - the adequate helideck perimeter lighting
  - the adequate helideck touchdown marking lighting (“H” and TD/PM Circle lighting) and/or floodlighting
  - the status lights (for day and night operations)
  - the helideck markings
  - the dominant obstacle paint schemes and lighting, and
  - the general installation lighting levels including floodlighting.

Note 2: Where inadequate helideck lighting exists, the Helideck Limitation List (HLL) is to be annotated “daylight only operations”.

- d) The general examination of the deck surface is to include:
- the surface friction
  - the helideck net (as applicable)
  - the drainage system
  - the deck edge perimeter safety netting
  - the tie-down points, and
  - the cleaning of all contaminants (to maintain satisfactory recognition of helideck markings and preservation of the helideck friction surface).
- e) The verification of the environment effects is to include:
- foreign object damage
  - air quality degradation due to exhaust emissions, hot and cold vented gas emissions and physical turbulence generators
  - bird control
  - any adjacent helideck/installation having significant environmental effects in any air quality assessment, and
  - flares.
- f) The general examination of the rescue and fire fighting facilities is to include:
- the primary and complementary media types, quantities, capacity and systems
  - the Personal Protective Equipment (PPE), and
  - the crash box.
- g) The general examination of the communications and navigation system arrangements is to include:
- the aeronautical radio(s)
  - the radio/telephone (R/T) call sign to match helideck name and side identification which should be simple and unique
  - the Non-Directional Beacon (NDB) or equivalent (as appropriate), and
  - the radio log.
- h) The general examination of the fuelling facilities is to include:
- the fuel system, ventilation, fire protection and detection
  - the pump and aircraft bonding safety systems.
- i) The general examination of the additional operational and handling equipment is to include:
- the windsock
  - the meteorological information (recorded by an automated means)
  - the Helideck Motion System recording and reporting (where applicable)
  - the passenger briefing system
  - the chocks
  - the tie-downs, and
  - the weighing scales for passengers, baggage and freight.

## **4 Offshore Access System (OAS)**

### **4.1 Application**

**4.1.1** The requirements of this Article apply to ships which have been assigned the additional class notation **OAS**, as defined in Ch 1, Sec 2, [6.25.7].

### **4.2 Periodical surveys**

**4.2.1** For survey requirements and for periodical surveys, refer to Section 9 of NI 629, Certification of Offshore Access Systems.

## **5 Offshore handling systems (OHS)**

### **5.1 Application**

**5.1.1** The requirements of this Article apply to ships which have been assigned the additional class notation **OHS**, as defined in Ch 1, Sec 2, [6.25.6].

### **5.2 Periodical surveys**

**5.2.1** For survey requirements and for periodical surveys, refer to Section 4 of NR595 Classification of Offshore Handling Systems.

# Part A

## Classification and Surveys

---

### CHAPTER 6

## RETROACTIVE REQUIREMENTS FOR EXISTING SHIPS

---

Section 1	General
Section 2	Bulk Carriers, Ore Carriers and Combination Carriers
Section 3	Ro-ro Passenger Ships
Section 4	Cargo Ships
Section 5	Ships with Ice Classes
Appendix 1	Technical Retroactive Requirements for Bulk Carriers and Other Types of Ships

# Section 1 General

## 1 General

### 1.1

**1.1.1** The purpose of this Chapter is to deal with the retroactive rule requirements applicable to existing ships which derive from the implementation of SOLAS regulations, IACS Unified Requirements or specific regulations from an Administration.

**1.1.2** These requirements are relevant to both construction features and surveyable items. They are laid down in the following Sections according to the service notations assigned to ships.

This Chapter also contains an Appendix for ready reference reproducing the text of the retroactive IACS Unified Requirements relevant to ships assigned the service notation **bulk carrier ESP**.

As a rule, requirements related to additional service features **BC-A**, **BC-B** or **BC-C** are not applicable to ships having the service notation **bulk carrier ESP** contracted for construction before 1<sup>st</sup> July 2003 or contracted for construction on or after 1<sup>st</sup> July 2003 but less than 150 m in length.

### 1.2 List of retroactive rule requirements

**1.2.1** Tab 1 summarises these retroactive requirements indicating the service notations to which they are applicable and in which Section they are given.

**Table 1 : Summary of retroactive rule requirements**

Service notation	Section in Chapter 6	Ship's survey items or features concerned
<b>bulk carrier ESP</b>	Ch 6, Sec 2	<ul style="list-style-type: none"> <li>- Scantlings of transverse bulkhead between the two foremost cargo holds</li> <li>- Allowable hold loading of the foremost cargo hold</li> <li>- Damage stability</li> <li>- Intermediate survey in lieu of annual survey in the foremost cargo hold</li> <li>- Detection of water ingress into cargo holds</li> <li>- Cargo hatch cover securing arrangements</li> <li>- Renewal criteria for side shell frames and brackets</li> <li>- Restriction from sailing with any hold empty</li> </ul>
<b>bulk carrier ESP</b> <b>ore carrier ESP</b> <b>combination carrier/OBO ESP</b> <b>combination carrier/OOC ESP</b>	Ch 6, Sec 2	<ul style="list-style-type: none"> <li>- Loading conditions, loading manuals and loading instruments</li> <li>- Strength and securing of small hatches on the exposed fore deck</li> <li>- Strength requirements for fore deck fittings and equipment</li> <li>- Hold, ballast and dry space water level detectors</li> <li>- Availability of pumping systems</li> </ul>
<b>ro-ro passenger ship</b>	Ch 6, Sec 3	<ul style="list-style-type: none"> <li>- Increased stability and watertight integrity</li> </ul>
<b>general cargo ship</b> <b>bulk carrier</b> (without ESP) <b>refrigerated cargo ship</b> <b>livestock carrier</b> <b>deck ship</b>	Ch 6, Sec 4	<ul style="list-style-type: none"> <li>- Strength and securing of small hatches on the exposed fore deck</li> <li>- Strength requirements for fore deck fittings and equipment</li> </ul>
ships with Ice Classes	Ch 6, Sec 5	<ul style="list-style-type: none"> <li>- Maintenance of additional class notations <b>ICE CLASS IA SUPER</b>, <b>ICE CLASS IA</b>, <b>ICE CLASS IB</b>, <b>ICE CLASS IC</b></li> </ul>

# Section 2 Bulk Carriers, Ore Carriers and Combination Carriers

## 1 Foremost cargo hold requirements

### 1.1 Application

1.1.1 These retroactive rule requirements apply to ships with service notation **bulk carrier ESP**:

- of single side skin construction see Note 1
- of 150 metres in length and above
- intended to carry solid bulk cargoes having a bulk density of 1,78 t/m<sup>3</sup> or above
- contracted for construction prior to 1<sup>st</sup> July 1998, and not constructed in compliance with the applicable requirements for new buildings contracted after that date, and given in Pt D, Ch 4, Sec 3.

Note 1: Single side skin bulk carriers means, as defined in SOLAS conf. 4/25 Res.6, where one or more cargo holds are bound by the side shell only or by two watertight boundaries, one of which is the side shell, which are less than 760 mm apart in bulk carriers constructed before 1<sup>st</sup> January 2000, and less than 1000 mm apart in bulk carriers constructed on or after 1<sup>st</sup> January 2000. The distance between the watertight boundaries is to be measured perpendicular to the side shell (ref.: IMO MSC Res.89(71)).

1.1.2 They are related to:

- scantlings of the transverse corrugated cargo hold bulkhead between the two foremost cargo holds, as detailed in [1.3]
- allowable hold loading of the foremost cargo hold with the same hold flooded, as detailed in [1.4]
- damage stability with the foremost cargo hold flooded, as detailed in [1.5].

### 1.2 Schedule for compliance

1.2.1 These requirements are to be complied with by the following limit dates:

- for ships which were 20 years of age or more on 1<sup>st</sup> July 1998, by the due date of the first intermediate survey or the due date of the first class renewal survey, to be held after 1<sup>st</sup> July 1998, whichever comes first
- for ships which were 15 years of age or more, but less than 20 years on 1<sup>st</sup> July 1998, by the due date of the first class renewal survey to be held after 1<sup>st</sup> July 1998, but not later than 1<sup>st</sup> July 2002
- for ships which were 10 years of age or more, but less than 15 years on 1<sup>st</sup> July 1998, by the due date of the next intermediate survey or class renewal survey after the date on which the ship reaches 15 years of age, but not later than the date on which the ship reaches 17 years of age
- for ships which were 5 years of age or more, but less than 10 years on 1<sup>st</sup> July 1998, by the due date, after 1<sup>st</sup> July 2003, of the next intermediate survey or class renewal survey after the date on which the ship reaches 10 years of age, whichever occurs first
- for ships which were less than 5 years of age on 1<sup>st</sup> July 1998, by the date on which the ship reaches 10 years of age.

1.2.2 Completion, prior to 1<sup>st</sup> July 2003, of an intermediate or class renewal survey with a due date after 1<sup>st</sup> July 2003, cannot be used to postpone compliance.

However, completion prior to 1<sup>st</sup> July 2003 of an intermediate survey the window for which straddles 1<sup>st</sup> July 2003 can be accepted.

### 1.3 Scantlings of the vertically corrugated transverse watertight bulkhead between the two foremost cargo holds

1.3.1 The net scantlings of the vertically corrugated transverse watertight bulkhead between the two foremost cargo holds are to be assessed in accordance with the method given in Ch 6, App 1, [2].

In these requirements, homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for the two foremost cargo holds, does not exceed 1,20, to be corrected for different cargo densities.

1.3.2 Thickness measurements are necessary to determine the general condition of the structure and to define the extent of possible repairs and/or reinforcements of the vertically corrugated transverse watertight bulkhead for verification of the compliance with the requirements given in Ch 6, App 1, [2].

Thickness measurements and assessment of the scantlings are to be carried out for the initial evaluation at the limit date as defined in [1.2.1], and thereafter at each subsequent intermediate survey (for ships over 10 years of age) and each subsequent class renewal survey for purposes of verifying continuing compliance with the above mentioned requirements.

**1.3.3** Taking into account the buckling criteria applied in Ch 6, App 1, [2] in the evaluation of strength of the bulkhead, it is essential to determine the thickness diminution at the critical levels shown in Fig 1 and Fig 2.

**1.3.4** Thickness measurements are to be carried out at the levels indicated in [1.3.5]. To adequately assess the scantlings of each individual vertical corrugation, each corrugation flange, web, shedder plate (see Ch 6, App 1, Fig 4 and Ch 6, App 1, Fig 5) and gusset plate (see Ch 6, App 1, Fig 6, Ch 6, App 1, Fig 7 and Ch 6, App 1, Fig 8) within each of the levels indicated in [1.3.5] is to be measured.

**1.3.5** The locations at which thickness measurements are to be carried out are as follows for each of the prescribed levels a, b and c:

- level a - bulkheads without lower stool (see Fig 1)
  - the mid-breadth of the corrugation flanges and webs at approximately 200 mm above the line of shedder plates
  - the middle of gusset plates between corrugation flanges, where fitted
  - the middle of the shedder plates
- level b - bulkheads with lower stool (see Fig 2)
  - the mid-breadth of the corrugation flanges and webs at approximately 200 mm above the line of shedder plates
  - the middle of gusset plates between corrugation flanges, where fitted
  - the middle of the shedder plates
- level c - bulkheads with or without lower stool (see Fig 1 and Fig 2)
  - the mid-breadth of the corrugation flanges and webs at approximately the mid-height of the corrugation.

Where the thickness changes within the horizontal levels, the thinner plate is to be measured.

**1.3.6** Where necessary, steel renewal and/or reinforcements are to meet the requirements given in Ch 6, App 1, [2.6].

**Figure 1 : Thickness measurement areas of cargo hold transverse bulkhead without lower stool**

**Figure 2 : Thickness measurement areas of cargo hold transverse bulkhead with lower stool**

**1.4 Allowable hold loading of the foremost cargo hold with the same hold flooded**

**1.4.1** The loading in the foremost cargo hold is not to exceed the allowable hold loading in the flooded condition. The method of calculation is laid down in Ch 6, App 1, [4].

In no case is the allowable hold loading in the flooding condition to be taken greater than the design hold loading in the intact condition.

## **1.5 Damage stability**

**1.5.1** Bulk carriers which are subject to compliance with the requirements laid down in [1.3.1] and [1.4.1] are, when loaded to the summer loadline, to be able to withstand flooding of the foremost cargo hold in all loading conditions and remain afloat in a satisfactory condition of equilibrium, as specified in [1.5.2].

**1.5.2** The condition of equilibrium after flooding is to satisfy the condition of equilibrium laid down in Pt B, Ch 3, App 4. The assumed flooding need only take into account flooding of the cargo hold. The permeability of a loaded hold is to be assumed as 0,90 and the permeability of an empty hold is to be assumed as 0,95, unless a permeability relevant to a particular cargo is assumed for the volume of a flooded hold occupied by cargo and a permeability of 0,95 is assumed for the remaining empty volume of the hold.

**1.5.3** Bulk carriers which have been assigned a reduced freeboard in compliance with the provisions of Pt B, Ch 3, App 4 may be considered as complying with [1.5.1].

## **2 Loading instruments and loading manuals**

### **2.1 Loading instruments**

**2.1.1** Bulk carriers, ore carriers and combination carriers, which are assigned one of the following service notations:

- **bulk carrier ESP**
- **ore carrier ESP**
- **combination carrier/OBO ESP**
- **combination carrier/OOC ESP**

of 150 m length and above, which were contracted for construction before 1<sup>st</sup> July 1998, are to be provided with an approved loading instrument of a type to the satisfaction of the Society not later than their entry into service or 1<sup>st</sup> January 1999, whichever occurs later.

### **2.2 Loading manuals**

**2.2.1** All single side skin bulk carriers which are assigned the service notation **bulk carrier ESP**, of 150 m length and above, which were contracted for construction before 1<sup>st</sup> July 1998 are to be provided before 1<sup>st</sup> July 1999, or their entry into service whichever occurs later, with an approved loading manual with typical loading sequences where the ship is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, relevant part load conditions and alternate conditions, where applicable. Typical unloading sequences for these conditions are also to be included. Guidance for preparation of such loading/unloading sequences is given in Ch 6, App 1, [7].

## **3 Strength requirements for fore deck fittings and equipment, strength and securing of small hatches on the exposed fore deck**

### **3.1 Application and requirements**

**3.1.1** These retroactive rule requirements apply to ships which are assigned one of the following service notations:

- **bulk carrier ESP**
- **bulk carrier BC-A ESP**
- **bulk carrier BC-B ESP**
- **bulk carrier BC-C ESP**
- **ore carrier ESP**
- **combination carrier/OBO ESP**
- **combination carrier/OOC ESP,**

of 100 m in length and above, that are contracted for construction prior to 1<sup>st</sup> January 2004.

**3.1.2** These retroactive rule requirements provide strength requirements to resist green sea forces for the following items located within the forward quarter length: air pipes, ventilator pipes and their closing devices.

They are applicable only for air pipes, ventilator pipes and their closing devices on the exposed deck serving spaces forward of the collision bulkhead, and to spaces which extend over this line aft-wards.

The provisions for compliance with these strength requirements for fore deck fittings and equipment are given in Pt C, Ch 1, Sec 10, [9.1.9].

These retroactive rule requirements are also applicable for small hatches on the exposed deck giving access to spaces forward of the collision bulkhead, and to spaces which extend over this line aft-wards.

They are related to the strength of, and securing for, such small hatches fitted on the exposed fore deck.

The provisions for compliance with these requirements for strength and securing of small hatches on the exposed fore deck are given in Pt B, Ch 11, Sec 10, [3].

Note 1: For ships contracted for construction prior to 1<sup>st</sup> July 2007, the following is to be carried out:

- securing devices of hatches designed for emergency escape are to be of a quick-acting type (e.g. one action wheel handles are to be provided as central locking devices for latching/unlatching of hatch cover) operable from both sides of the hatch cover, by the compliance date specified in [3.2.1] or by the due date of the first class renewal survey after 1<sup>st</sup> July 2007 whichever is later. Completion prior to 1<sup>st</sup> July 2007 of a class renewal survey with a due date after 1<sup>st</sup> July 2007 cannot be used to postpone compliance.

Note 2: These requirements do not apply to the cargo tank venting systems and the inert gas systems of tankers.

### **3.2 Schedule for compliance**

**3.2.1** Ships referred to in [3.1.1] are to comply with the provisions of Pt B, Ch 11, Sec 10, [3] and of Pt C, Ch 1, Sec 10, [9.1.9] by the following dates:

- for ships which will be 15 years of age or more on 1<sup>st</sup> January 2004, by the due date of the first intermediate or class renewal survey after that date
- for ships which will be 10 years of age or more on 1<sup>st</sup> January 2004, by the due date of the first class renewal survey after that date
- for ships which will be less than 10 years of age on 1<sup>st</sup> January 2004, by the date on which the ship reaches 10 years of age.

**3.2.2** Completion, prior to 1<sup>st</sup> January 2004, of an intermediate or class renewal survey with a due date after 1<sup>st</sup> January 2004 cannot be used to postpone compliance. However, completion prior to 1<sup>st</sup> January 2004 of an intermediate survey the window for which straddles 1<sup>st</sup> January 2004 can be accepted.

## **4 Cargo hatch cover securing arrangements for bulk carriers**

### **4.1 Application and requirements**

**4.1.1** These retroactive rule requirements apply to ships which are assigned one of the following service notations:

- **bulk carrier ESP**
- **bulk carrier BC-A ESP**
- **bulk carrier BC-B ESP**
- **bulk carrier BC-C ESP,**

and which were not built in accordance with Pt B, Ch 9, Sec 7, [1] to Pt B, Ch 9, Sec 7, [7] of edition February 2003 of the Rules as amended in accordance with November 2003 amendments or subsequent editions.

**4.1.2** They are related to steel hatch cover securing devices and stoppers for cargo hold hatchways No 1 and No 2 which are wholly or partially within 0,25 L of the fore perpendicular, except pontoon type hatch cover.

The provisions for compliance with these requirements for cargo hatch cover securing arrangements are given in Ch 6, App 1, [6].

### **4.2 Schedule for compliance**

**4.2.1** Ships referred to in [4.1.1] are to comply with the provisions of Ch 6, App 1, [6] by the following dates:

- for ships which will be 15 years of age or more on 1<sup>st</sup> January 2004, by the due date of the first intermediate or class renewal survey after that date
- for ships which will be 10 years of age or more on 1<sup>st</sup> January 2004, by the due date of the first class renewal survey after that date
- for ships which will be less than 10 years of age on 1<sup>st</sup> January 2004, by the date on which the ship reaches 10 years of age.

**4.2.2** Completion, prior to 1<sup>st</sup> January 2004 of an intermediate or class renewal survey with a due date after 1<sup>st</sup> January 2004 cannot be used to postpone compliance. However, completion prior to 1<sup>st</sup> January 2004 of an intermediate survey the window for which straddles 1<sup>st</sup> January 2004 can be accepted.

## **5 Renewal criteria for side shell frames and brackets in single side skin bulk carriers and single side skin OBO carriers**

### **5.1 Application and requirements**

**5.1.1** These retroactive rule requirements apply to:

- the side shell frames and brackets of cargo holds bounded by the single side shell of ships with service notation **bulk carrier ESP** constructed with single deck, topside tanks and hopper tanks in cargo spaces intended primarily to carry dry cargo in bulk,

- the side shell frames and brackets of cargo holds bounded by the single side shell of ships with service notation **combination carrier/OBO ESP** as defined in Ch 1, Sec 2, [4.3.4] but of single side skin construction,

which were not built in accordance with the applicable requirements of Part II, Chapter 8, Section 8-03 of the 1<sup>st</sup> April 1998 edition of the Rules or subsequent editions.

In the case a ship as defined above does not satisfy above definition in one or more holds, the retroactive rule requirements do not apply to these individual holds.

**5.1.2** These requirements define steel renewal criteria or other measures (reinforcement or coating) to be taken for the webs and flanges of side shell frames and brackets as per the provisions of Ch 6, App 1, [5].

Reinforcing measures of side frames are also defined as per Ch 6, App 1, [5.4.2].

Finite element or other numerical analysis or direct calculation procedures cannot be used as an alternative to compliance with these requirements, except in cases of unusual side structure arrangements or framing to which these requirements cannot be directly applied. In such cases, the analysis criteria and the strength check criteria are to be in accordance with the Rules of the Society.

## **5.2 Schedule for compliance**

**5.2.1** Steel renewal, reinforcement or coating, where required in accordance with Ch 6, App 1, [5], is to be carried out in accordance with the following schedule and at subsequent intermediate and class renewal surveys, for ships with service notation **bulk carrier ESP**.

- for ships which will be 15 years of age or more on 1<sup>st</sup> January 2004, by the due date of the first intermediate or class renewal survey after that date
- for ships which will be 10 years of age or more on 1<sup>st</sup> January 2004, by the due date of the first class renewal survey after that date
- for ships which will be less than 10 years of age on 1<sup>st</sup> January 2004, by the date on which the ship reaches 10 years of age.

**5.2.2** For ships with service notation **bulk carrier ESP**, completion, prior to 1<sup>st</sup> January 2004, of an intermediate or class renewal survey with a due date after 1<sup>st</sup> January 2004 cannot be used to postpone compliance. However, completion prior to 1<sup>st</sup> January 2004 of an intermediate survey the window for which straddles 1<sup>st</sup> January 2004 can be accepted.

**5.2.3** Steel renewal, reinforcement or coating, where required in accordance with Ch 6, App 1, [5], is to be carried out in accordance with the following schedule and at subsequent intermediate and class renewal surveys, for ships with service notation **combination carrier/OBO ESP**:

- for ships which will be 15 years of age or more on 1<sup>st</sup> July 2005, by the due date of the first intermediate or class renewal survey after that date
- for ships which will be 10 years of age or more on 1<sup>st</sup> July 2005, by the due date of the first class renewal survey after that date
- for ships which will be less than 10 years of age on 1<sup>st</sup> July 2005, by the date on which the ship reaches 10 years of age.

**5.2.4** For ships with service notation **combination carrier/OBO ESP**, completion, prior to 1<sup>st</sup> July 2005 of an intermediate or class renewal survey with a due date after 1<sup>st</sup> July 2005 cannot be used to postpone compliance. However, completion prior to 1<sup>st</sup> July 2005 of an intermediate survey the window for which straddles 1<sup>st</sup> July 2005 can be accepted.

## **5.3 Requirements for the gauging of side shell frames and brackets**

**5.3.1** Gauging is required to determine the general condition of the structure and to define the extent of possible steel renewals or other measures for the webs and flanges of side shell frames and brackets for verification of the compliance with the requirements of Ch 6, App 1, [5].

**5.3.2** For the purpose of steel renewal, sand blasting and coating, four zones A, B, C and D are defined, as shown in Fig 3. Zones A and B are considered to be the most critical zones.

**5.3.3** Pits can grow in a variety of shapes, some of which would need to be ground before assessment.

Pitting corrosion may be found under coating blisters, which must be removed before inspection.

To measure the remaining thickness of pits or grooving, a miniature transducer (3 to 5 mm diameter) must be used. Alternatively, the gauging firm must use a pit gauge to measure the depth of the pits and grooving and calculate the remaining thickness.

The assessment based upon area is the method specified in Ch 6, App 1, [5.4.4] and is based upon the intensity determined from Fig 4.

If pitting intensity is higher than 15% in an area (see Fig 4), then thickness measurements are to be taken to check the extent of the pitting corrosion. The 15% is based upon pitting or grooving on only one side of the plate.

In cases where pitting is evident as defined above (exceeding 15%), then an area of 300 mm diameter or more (or, where this is impracticable on the frame flange or the side shell, hopper tank plating or topside tank plating attached to the side frame, an equivalent rectangular area), at the most pitted part, is to be cleaned to bare metal, and the thickness measured in way of the five

deepest pits within the cleaned area. The least thickness measured in way of any of these pits is to be taken as the thickness to be recorded.

The minimum acceptable remaining thickness in any pit or groove is equal to:

- 75% of the as-built thickness, for pitting or grooving in the cargo hold side frame webs and flanges
- 70% of the as-built thickness, for pitting or grooving in the side shell, hopper tank and topside tank plating attached to the cargo hold side frame, over a width up to 30 mm from each side of it.

**5.3.4** Numbers of side frames to be measured are equivalent to those of the class renewal survey or intermediate survey corresponding to the ship's age. Representative thickness measurements are to be taken for each zone as specified below. Special consideration to the extent of the thickness measurements may be given by the Society, if the structural members show no thickness diminution with respect to the as-built thicknesses and the coating is found in "as-new" condition (i.e without breakdown or rusting).

**Figure 3 : Zones of side shell frames and brackets**

**Figure 4 : Pitting intensity diagrams (from 5% to 25% intensity)**

If renewal or other measures according to the present Article [5] are to be applied on individual frames in a hold, then all frames in that hold are to be gauged.

Where gauging readings close to the criteria are found, the number of hold frames to be measured is to be increased.

There is a variety of construction methods used for side shell frames in bulk carriers. Some have face plates (T sections) on the side shell frames, some have flanged plates and some have bulb plates. The use of face plates and flanged sections is considered similar for gauging purposes in that both the web and face plate or web and flange plate are to be gauged. If bulb plate has been used, then web of the bulb plate is to be gauged in the normal manner and the sectional modulus has to be specially considered if required.

**5.3.5** The gauging pattern for web plating for zones A, B and D are to be a five point pattern (see Fig 5). The 5 point pattern is to be over the depth of the web and the same area vertically. The gauging report is to reflect the average reading.

**5.3.6** Depending upon the condition of the web in way of zone C, the web plating for zone C is to be measured by taking 3 readings over the length of zone C and averaging them. The average reading is to be compared with the allowable thickness. If the web plating has general corrosion then this pattern is to be expanded to a five point pattern as noted in [5.3.5].

**5.3.7** Where the lower bracket length or depth does not meet the requirements in Pt D, Ch 4, Sec 3, [2.2.5], gaugings are to be taken at sections a) and b) to calculate the actual section modulus required in Ch 6, App 1, [5.5.5] (see Fig 6). At least 2 readings on the flange/face plate are to be taken in way of each section. At least one reading of the attached shell plating is to be taken on each side of the frame (i.e. fore and aft) in way of section a) and section b).

**Figure 5 : Typical 5 point pattern on the web plate**

**Figure 6 : Sections a) and b)**

- $d_a$  : Lower bracket web depth for determining  $t_{REN, S}$
- $d_b$  : Frame web depth
- $h_B$  : Lower bracket length.

## 6 Hold, ballast and dry space water level detectors

### 6.1 Application and requirements

6.1.1 These retroactive rule requirements apply to ships which are assigned one of the following service notations:

- bulk carrier ESP
- bulk carrier BC-A ESP
- bulk carrier BC-B ESP
- bulk carrier BC-C ESP
- ore carrier ESP
- combination carrier/OBO ESP
- combination carrier/OOC ESP,

of 500 GT and above constructed before 1 July 2004.

6.1.2 They are related to the fitting of water level detectors.

The provisions for compliance with these requirements are given in Pt C, Ch 1, Sec 10, [6.12.1] and Pt C, Ch 1, Sec 10, [6.6.3], item d).

### 6.2 Schedule for compliance

6.2.1 Ships referred to in [6.1.1] are to comply with the provisions of Pt C, Ch 1, Sec 10, [6.12.1] and Pt C, Ch 1, Sec 10, [6.6.3], item d) not later than the date of the annual, intermediate or class renewal survey of the ship to be carried out after 1<sup>st</sup> July 2004, whichever comes first.

## 7 Availability of pumping systems

### 7.1 Application and requirements

7.1.1 These retroactive rule requirements apply to ships which are assigned one of the following service notations:

- bulk carrier ESP
- bulk carrier BC-A ESP
- bulk carrier BC-B ESP
- bulk carrier BC-C ESP
- ore carrier ESP
- combination carrier/OBO ESP
- combination carrier/OOC ESP,

of 500 GT and above constructed before 1<sup>st</sup> July 2004.

7.1.2 They are related to the availability of pumping systems.

The provisions for compliance with these requirements are given in Pt C, Ch 1, Sec 10, [6.6.3], item e).

### 7.2 Schedule for compliance

7.2.1 Ships referred to in [7.1.1] are to comply with the provisions of Pt C, Ch 1, Sec 10, [6.6.3], item e) not later than the date of the first intermediate or class renewal survey of the ship to be carried out after 1<sup>st</sup> July 2004, but in no case later than 1<sup>st</sup> July 2007.

## 8 Restriction from sailing with any hold empty

### 8.1 Application and requirements

8.1.1 These retroactive rule requirements apply to ships which are assigned one of the service notations **bulk carrier ESP** or **combination carrier/OBO ESP**:

- of single side skin construction
- of 150 metres in length and above
- intended to carry solid bulk cargoes having a density of 1,78 t/m<sup>3</sup> in alternate hold loading conditions
- contracted for construction prior to 1<sup>st</sup> July 1998 or constructed before 1<sup>st</sup> July 1999.

8.1.2 Such ships, if not meeting the requirements for withstanding flooding of any one cargo hold, as specified in Part II, Chapter 8, Section 8-03, 8-032-2, 8-037-3 and 8-033-4 of the 1<sup>st</sup> April 1998 edition of the Rules or subsequent editions, and the retroactive requirements for side structure of bulk carriers of single-side skin construction, as specified in [5], are not to sail with

any hold loaded to less than 10% of the hold's maximum allowable cargo weight when in the full load condition, after reaching 10 years of age.

The applicable full load condition for this requirement is a load equal to, or greater than, 90% of the ship's deadweight at the relevant assigned freeboard.

**8.1.3** Any restrictions imposed on the carriage of solid bulk cargoes having a density of 1,78 t/m<sup>3</sup> and above in accordance with these requirements are to be identified and recorded in the loading manual.

**8.1.4** A ship to which the requirements in [8.1.3] apply is to be permanently marked on the side shell amidships, port and starboard, with a solid equilateral triangle having sides of 500 mm and its apex 300 mm below the deck line, and painted a contrasting colour to that of the hull.

# Section 3 Ro-ro Passenger Ships

## 1 General

### 1.1 Application

1.1.1 Ships which have been assigned the service notation **ro-ro passenger ship** constructed before 1<sup>st</sup> July 1997 are to comply with all the requirements indicated in [2].

## 2 Increased stability and watertight integrity

### 2.1

2.1.1 Ships referred to in [1.1.1] are to comply with the provisions of Pt D, Ch 12, Sec 3, [2.3] not later than the first class renewal survey after the prescribed date of compliance given in Tab 1, according to the value of  $A/A_{max}$  as defined in the annex of the Calculation Procedure to assess the survivability characteristics of existing ro-ro passenger ships when using a simplified method based upon resolution A.265(VIII), developed by the Maritime Safety Committee at its fifty-ninth session in June 1991 (MSC/Circ. 574).

**Table 1 : Date of compliance according to  $A/A_{max}$**

Value of $A/A_{max}$	Date of compliance
$A/A_{max} < 85\%$	1 <sup>st</sup> October 1998
$85\% \leq A/A_{max} < 90\%$	1 <sup>st</sup> October 2000
$90\% \leq A/A_{max} < 95\%$	1 <sup>st</sup> October 2002
$95\% \leq A/A_{max} < 97,5\%$	1 <sup>st</sup> October 2004
$A/A_{max} \geq 97,5\%$	1 <sup>st</sup> October 2005

2.1.2 Notwithstanding the provisions of [2.1.1], ships referred to in [1.1.1] which are certified to carry 400 persons or more are to comply with the provisions of Pt D, Ch 12, Sec 3, [2.3.12], assuming the damage applied anywhere within the ship's length L, not later than the date of the first class renewal survey after the prescribed date of compliance, which is the one occurring the latest among those given in Tab 2, Tab 3 and item a).

**Table 2 : Date of compliance according to  $A/A_{max}$**

Value of $A/A_{max}$	Date of compliance
$A/A_{max} < 85\%$	1 <sup>st</sup> October 1998
$85\% \leq A/A_{max} < 90\%$	1 <sup>st</sup> October 2000
$90\% \leq A/A_{max} < 95\%$	1 <sup>st</sup> October 2002
$95\% \leq A/A_{max} < 97,5\%$	1 <sup>st</sup> October 2004
$A/A_{max} \geq 97,5\%$	1 <sup>st</sup> October 2010

**Table 3 : Date of compliance according to the number of persons permitted to be carried**

Number of persons (N.)	Date of compliance
$N. \geq 1500$	1 <sup>st</sup> October 2002
$1000 \leq N. < 1500$	1 <sup>st</sup> October 2006
$600 \leq N. < 1000$	1 <sup>st</sup> October 2008
$400 \leq N. < 600$	1 <sup>st</sup> October 2010

- a) when the age of the ship is equal to or greater than 20 years, where the age of the ship means the time counted from the date on which the keel was laid, or the date on which it was at a similar stage of construction, or from the date on which the ship was converted to a ro-ro passenger ship.

## Section 4 Cargo Ships

### 1 Strength requirements for fore deck fittings and equipment, strength and securing of small hatches on the exposed fore deck

#### 1.1 Application and requirements

1.1.1 These retroactive rule requirements apply to ships which are assigned one of the following service notations:

- **general cargo ship**
- **bulk carrier** (without ESP additional service feature)
- **refrigerated cargo ship**
- **livestock carrier**
- **deck ship,**

of 100 m in length and above, that are contracted for construction prior to 1<sup>st</sup> January 2004.

Note 1: The requirements also apply to dedicated forest product carriers (other than woodchip carriers) and to dedicated cement carriers.

1.1.2 These retroactive rule requirements provide strength requirements to resist green sea forces for the following items located within the forward quarter length: air pipes, ventilator pipes and their closing devices.

They are applicable only for air pipes, ventilator pipes and their closing devices on the exposed deck serving spaces forward of the collision bulkhead, and to spaces which extend over this line aft-wards.

The provisions for compliance with these strength requirements for fore deck fittings and equipment are given in Pt C, Ch 1, Sec 10, [9.1.9].

These retroactive rule requirements are also applicable for small hatches on the exposed deck giving access to spaces forward of the collision bulkhead, and to spaces which extend over this line aft-wards.

They are related to the strength of, and securing for, such small hatches fitted on the exposed fore deck.

The provisions for compliance with these requirements for strength and securing of small hatches on the exposed fore deck are given in Pt B, Ch 11, Sec 10, [3].

Note 1: For ships contracted for construction prior to 1<sup>st</sup> July 2007, the following is to be carried out:

- securing devices of hatches designed for emergency escape are to be of a quick-acting type (e.g. one action wheel handles are to be provided as central locking devices for latching/unlatching of hatch cover) operable from both sides of the hatch cover,

by the compliance date specified in [1.2.1] or by the due date of the first class renewal survey after 1<sup>st</sup> July 2007 whichever is later. Completion prior to 1<sup>st</sup> July 2007 of a class renewal survey with a due date after 1<sup>st</sup> July 2007 cannot be used to postpone compliance.

Note 2: These requirements do not apply to the cargo tank venting systems and the inert gas systems of tankers.

#### 1.2 Schedule for compliance

1.2.1 Ships referred to in [1.1.1] are to comply with the provisions of Pt B, Ch 11, Sec 10, [3] and of Pt C, Ch 1, Sec 10, [9.1.9] by the following dates:

- for ships which will be 15 years of age or more on 1<sup>st</sup> January 2004, by the due date of the first intermediate or class renewal survey after that date
- for ships which will be 10 years of age or more on 1<sup>st</sup> January 2004, by the due date of the first class renewal survey after that date
- for ships which will be less than 10 years of age on 1<sup>st</sup> January 2004, by the date on which the ship reaches 10 years of age.

1.2.2 Completion, prior to 1<sup>st</sup> January 2004, of an intermediate or class renewal survey with a due date after 1<sup>st</sup> January 2004 cannot be used to postpone compliance. However, completion prior to 1<sup>st</sup> January 2004 of an intermediate survey the window for which straddles 1<sup>st</sup> January 2004 can be accepted.

### 2 Water level detectors on single hold cargo ships other than bulk carriers

#### 2.1 Application and requirements

2.1.1 These retroactive rule requirements normally apply to ships which are assigned one of the following service notations:

- **general cargo ship** (see Note 1 hereafter)
- **bulk carrier** (without ESP additional service feature)
- **refrigerated cargo ship**

- **container ship**,
- **ro-ro cargo ship** (see Note 2 hereafter)
- **livestock carrier**
- **deck ship** (see Note 2 hereafter)
- **liquefied gas carrier** (of LPG type) (see Note 2 hereafter)
- **supply vessel** (see Note 2 hereafter)

and

- of gross tonnage equal or above 500, and
- constructed before 1<sup>st</sup> January 2007 with length of less than 80 m, or 100 m if constructed before 1<sup>st</sup> July 1998, and
- with a single cargo hold below the freeboard deck or cargo holds below the freeboard deck which are not separated by at least one bulkhead made watertight up to that deck.

Note 1: The requirements also apply to dedicated cement carriers, dedicated forest product carriers, dedicated woodchip carriers, timber and log carriers with the same conditions.

Note 2: The scope of application for these type of ships is subject to special consideration.

**2.1.2** They are related to the fitting of water level detectors in such space or spaces.

**2.1.3** The water level detectors required by the present Article need not be fitted in ships complying with Ch 6, Sec 2, [6], or in ships having watertight side compartments each side of the cargo hold length extending vertically at least from inner bottom to freeboard deck.

## 2.2 Schedule for compliance

**2.2.1** Ships referred to in [2.1.1] are to comply with the provisions of Ch 6, App 1, [8] not later than 31<sup>st</sup> December 2009.

# Section 5 Ships with Ice Classes

## 1 General

### 1.1 Application

**1.1.1** Ships which have been assigned the additional class notations **ICE CLASS IB** or **ICE CLASS IC**, the keel of which has been laid or which has been at a similar stage of construction on 1<sup>st</sup> November 1986 or thereafter, but before 1<sup>st</sup> September 2003, are to comply with the requirements indicated in [2.1.1].

**1.1.2** Ships which have been assigned the additional class notations **ICE CLASS IA SUPER** or **ICE CLASS IA**, the keel of which has been laid or which has been at a similar stage of construction before 1<sup>st</sup> September 2003, are to comply with the requirements indicated in [2.1.2].

**1.1.3** Ships which have been assigned one of the additional class notations **ICE CLASS IA SUPER** or **ICE CLASS IA** or **ICE CLASS IB** or **ICE CLASS IC** built before 1<sup>st</sup> July 2007 are to comply with the requirements indicated in [3].

## 2 Requirements to maintain ice classes

### 2.1

**2.1.1** Ships referred to in [1.1.1] are to comply with the provisions of Pt F, Ch 8, Sec 1, [3.1] of the June 2000 edition of the Rules, in order to maintain their additional class notations **ICE CLASS IB** or **ICE CLASS IC**.

Note 1: In the formula of the BV Rules June 2000 edition, Pt F, Ch 8, Sec 1, [3.1], the displacement restriction is applied only to the part in the formula which is in parenthesis, and not to form factor  $F_3$ . The full displacement of the ship is to be used in factor  $F_3$ .

**2.1.2** Ships referred to in [1.1.2] are to comply with the provisions of Pt F, Ch 8, Sec 1, [3.1.3], in order to maintain their additional class notations **ICE CLASS IA SUPER** or **ICE CLASS IA**, at the following dates:

- 1<sup>st</sup> January 2005 or
- 1<sup>st</sup> January in the year when 20 years has elapsed since the year the ship was delivered,

whichever occurs the latest.

When, for an existing ship, values for some of the hull form parameters required for the calculation method in Pt F, Ch 8, Sec 1, [3.1.3] are difficult to obtain, the following alternative formulae can be used:

$$R_{CH} = C_1 + C_2 + C_3 (H_F + H_M)^2 (B + 0,658 H_F) + C_4 L H_F^2 + C_5 \left( \frac{LT}{B^2} \right)^3 \frac{B}{4}$$

$$\text{with } 5 \leq \left( \frac{LT}{B^2} \right)^3 \leq 20$$

- for **ICE CLASS IA**

$C_1$  and  $C_2$  are to be taken as zero.

- for **ICE CLASS IA SUPER**

Ship without a bulb,  $C_1$  and  $C_2$  are to be calculated as follows:

$$C_1 = f_1 \frac{BL}{2 \frac{T}{B} + 1} + 1,84 (f_2 B + f_3 L + f_4 BL)$$

$$C_2 = 3,52 (g_1 + g_2 B) + g_3 \left( 1 + 1,2 \frac{T}{B} \right) \frac{B^2}{\sqrt{L}}$$

- for **ICE CLASS IA SUPER**

Ship with a bulb,  $C_1$  and  $C_2$  are to be calculated as follows:

$$C_1 = f_1 \frac{BL}{2 \frac{T}{B} + 1} + 2,89 (f_2 B + f_3 L + f_4 BL)$$

$$C_2 = 6,67 (g_1 + g_2 B) + g_3 \left( 1 + 1,2 \frac{T}{B} \right) \frac{B^2}{\sqrt{L}}$$

Values of  $f_i$  and  $g_i$  are given in Tab 1.

$$C_3 = 460 \text{ kg}/(\text{m}^2 \cdot \text{s}^2)$$

$$C_4 = 18,7 \text{ kg}/(\text{m}^2 \cdot \text{s}^2)$$

$$C_5 = 825 \text{ kg}/\text{s}^2$$

**Table 1 : Values of  $f_i$  and  $g_i$**

$f_1 = 10,3 \text{ N}/\text{m}^2$	$g_1 = 1530 \text{ N}$
$f_2 = 45,8 \text{ N}/\text{m}$	$g_2 = 170 \text{ N}/\text{m}$
$f_3 = 2,94 \text{ N}/\text{m}$	$g_3 = 400 \text{ N}/\text{m}^{1,5}$
$f_4 = 5,8 \text{ N}/\text{m}^2$	

### 3 Ice class draught marking

#### 3.1

**3.1.1** Ships referred to in [1.1.3] are to be provided with a warning triangle and with an ice class draught mark at the maximum permissible ice class draught amidships as indicated in Pt F, Ch 8, Sec 1, Fig 2, if the UIWL is below the summer load line, not later than the first scheduled bottom survey in dry-dock after the 1<sup>st</sup> July 2007.

Note 1: The upper ice waterline (UIWL) shall be the envelope of the highest points of the waterlines at which the ship is intended to operate in ice. The line may be a broken line.

# Appendix 1      Technical Retroactive Requirements for Bulk Carriers and Other Types of Ships

## 1 General

### 1.1

1.1.1 The present Appendix contains the technical requirements applicable retroactively to existing ships listed in Ch 6, Sec 2.

## 2 Evaluation of scantlings of the transverse watertight vertically corrugated bulkheads between the two foremost cargo holds

### 2.1 Application and definitions

2.1.1 These requirements apply to ships indicated in Ch 6, Sec 2, [1.1.1].

2.1.2 In these requirements, homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for the two foremost cargo holds, does not exceed 1,20, to be corrected for different cargo densities.

2.1.3 The net scantlings of the transverse bulkhead between the two foremost cargo holds are to be calculated using the loads given in [2.2], the bending moment and shear force given in [2.3] and the strength criteria given in [2.4].

Where necessary, steel renewal and/or reinforcements are required as per [2.6].

### 2.2 Load model

#### 2.2.1 General

The loads to be considered as acting on the bulkhead are those given by the combination of the cargo loads with those induced by the flooding of the foremost cargo hold.

The most severe combinations of cargo induced loads and flooding loads are to be used for the check of the scantlings of the bulkhead, depending on the loading conditions included in the loading manual:

- homogeneous loading conditions
- non-homogeneous loading conditions.

Non-homogeneous part loading conditions associated with multiport loading and unloading operations for homogeneous loading conditions need not be considered according to these requirements.

#### 2.2.2 Bulkhead corrugation flooding head

The flooding head  $h_f$  (see Fig 1) is the distance, in m, measured vertically with the ship in the upright position, from the calculation point to a level located at a distance  $d_f$ , in m, from the base line equal to:

- D in general
- 0,95 D for ships less than 50000 t deadweight with type B freeboard,

D being the distance, in m, from the base line to the freeboard deck at side amidships (see Fig 1).

For ships to be operated at an assigned load line draught  $T_r$  less than the permissible load line draught T, the flooding head defined for the two cases above may be reduced by  $(T - T_r)$ .

#### 2.2.3 Pressure in the flooded hold: bulk cargo loaded hold

Two cases are to be considered, depending on the values of  $d_1$  and  $d_f$ ,  $d_1$  (see Fig 1) being a distance from the base line given, in m, by:

$$d_1 = \frac{M_c}{\rho_c l_c B} + \frac{v_{LS}}{l_c B} + (h_{HT} - h_{DB}) \frac{b_{HT}}{B} + h_{DB}$$

where:

- $M_c$  : Mass of cargo, in t, in the foremost cargo hold  
 $\rho_c$  : Bulk cargo density, in t/m<sup>3</sup>  
 $l_c$  : Length of the foremost cargo hold, in m  
 B : Ship's breadth amidships, in m  
 $v_{LS}$  : Volume, in m<sup>3</sup>, of the bottom stool above the inner bottom

Figure 1 : Calculation of pressure on the bulkhead in the flooded cargo hold

V = Volume of cargo

P = Calculation point

$h_{HT}$  : Height of the hopper tanks amidships, in m, from the base line

$h_{DB}$  : Height of the double bottom, in m

$b_{HT}$  : Breadth of the hopper tanks amidships, in m.

a) Case when  $d_f \geq d_1$

At each point of the bulkhead located at a distance between  $d_1$  and  $d_f$  from the base line, the pressure  $p_{c,f}$ , in kN/m<sup>2</sup>, is given

by:  $p_{c,f} = \rho g h_f$

where:

$\rho$  : Sea water density, in t/m<sup>3</sup>

$g$  : Gravity acceleration, equal to 9,81 m/s<sup>2</sup>

$h_f$  : Flooding head as defined in [2.2.2].

At each point of the bulkhead located at a distance lower than  $d_1$  from the base line, the pressure  $p_{c,f}$ , in kN/m<sup>2</sup>, is given by:

$p_{c,f} = \rho g h_f + [\rho_c - \rho (1 - \text{perm})] g h_1 \tan^2 \gamma$

where:

$\rho, g, h_f$  : As given above

$\rho_c$  : Bulk cargo density, in t/m<sup>3</sup>

perm : Permeability of cargo, to be taken as 0,3 for ore (corresponding bulk cargo density for iron ore may generally be taken as 3,0 t/m<sup>3</sup>)

$h_1$  : Vertical distance, in m, from the calculation point to a level located at a distance  $d_1$ , as defined above, from the base line (see Fig 1)

$\gamma$  :  $\gamma = 45^\circ - (\phi / 2)$

$\phi$  : Angle of repose of the cargo, in degrees, and may generally be taken as 35° for iron ore.

The force  $F_{c,f}$ , in kN, acting on a corrugation is given by:

$$F_{c,f} = s_1 \left[ \rho g \frac{(d_f - d_1)^2}{2} + \frac{\rho g (d_f - d_1) + (p_{c,i})_{le}}{2} (d_1 - h_{DB} - h_{LS}) \right]$$

where:

$s_1$  : Spacing of corrugations, in m (see Fig 2)

$\rho, g, d_1, h_{DB}$  : As given above

$d_f$  : As given in [2.2.2]

$(p_{c,i})_{le}$  : Pressure, in kN/m<sup>2</sup>, at the lower end of the corrugation

$h_{LS}$  : Height of the lower stool, in m, from the inner bottom.

b) Case when  $d_f < d_1$

At each point of the bulkhead located at a distance between  $d_f$  and  $d_1$  from the base line, the pressure  $p_{c,f}$ , in kN/m<sup>2</sup>, is given

by:  $p_{c,f} = \rho_c g h_1 \tan^2 \gamma$

where:

$\rho_c, g, h_1, \gamma$  : As given in a) above

At each point of the bulkhead located at a distance lower than  $d_f$  from the base line, the pressure  $p_{c,f}$ , in kN/m<sup>2</sup>, is given by:

$p_{c,f} = \rho g h_f + [\rho_c h_1 - \rho (1 - \text{perm}) h_f] g \tan^2 \gamma$

where:

$\rho$ ,  $g$ ,  $h_f$ ,  $\rho_c$ ,  $h_1$ , perm,  $\gamma$ : As given in item a) above.

The force  $F_{c,f}$ , in kN, acting on a corrugation is given by:

$$F_{c,f} = s_1 \left[ \rho_c g \frac{(d_1 - d_f)^2}{2} \tan^2 \gamma \right] + s_1 \left[ \frac{\rho_c g (d_1 - d_f) \tan^2 \gamma + (\rho_{c,f})_{le} (d_f - h_{DB} - h_{LS})}{2} \right]$$

where:

$s_1$ ,  $\rho_c$ ,  $g$ ,  $\gamma$ ,  $(\rho_{c,f})_{le}$ ,  $h_{LS}$ : As given in a) above

$d_1$ ,  $h_{DB}$ : As given in [2.2.3]

$d_f$ : As given in [2.2.2].

### 2.2.4 Pressure in the flooded hold: empty hold

At each point of the bulkhead, the hydrostatic pressure  $p_f$  induced by the flooding head  $h_f$  is to be considered.

The force  $F_f$ , in kN, acting on a corrugation is given by:

$$F_f = s_1 \rho g \frac{(d_f - h_{DB} - h_{LS})^2}{2}$$

where:

$s_1$ ,  $\rho$ ,  $g$ ,  $h_{LS}$ : As given in [2.2.3], item a)

$h_{DB}$ : As given in [2.2.3]

$d_f$ : As given in [2.2.2].

### 2.2.5 Pressure in the non-flooded bulk cargo loaded hold

At each point of the bulkhead, the pressure  $p_c$ , in kN/m<sup>2</sup>, is given by:  $p_c = \rho_c g h_1 \tan^2 \gamma$  where:

$\rho_c$ ,  $g$ ,  $h_1$ ,  $\gamma$ : As given in [2.2.3], item a).

The force  $F_c$ , in kN, acting on a corrugation is given by:

$$F_c = s_1 \rho_c g \frac{(d_1 - h_{DB} - h_{LS})^2}{2} \tan^2 \gamma$$

where:

$\rho_c$ ,  $g$ ,  $s_1$ ,  $h_{LS}$ ,  $\gamma$ : As given in [2.2.3], item a)

$d_1$ ,  $h_{DB}$ : As given in [2.2.3].

### 2.2.6 Resultant pressure in homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure  $p$ , in kN/m<sup>2</sup>, to be considered for the scantlings of the bulkhead is given by:  $p = p_{c,f} - 0,8 p_c$

The resultant force  $F$ , in kN, acting on a corrugation is given by:  $F = F_{c,f} - 0,8 F_c$

### 2.2.7 Resultant pressure in non-homogeneous loading conditions

At each point of the bulkhead structures, the resultant pressure  $p$ , in kN/m<sup>2</sup>, to be considered for the scantlings of the bulkhead is given by:  $p = p_{c,f}$

The resultant force  $F$ , in kN, acting on a corrugation is given by:  $F = F_{c,f}$

Where the foremost cargo hold, in non-homogeneous loading conditions, is not allowed to be loaded, the resultant pressure  $p$ , in kN/m<sup>2</sup>, to be considered for the scantlings of the bulkhead is given by:  $p = p_f$

and the resultant force  $F$ , in kN, acting on a corrugation is given by:  $F = F_f$

## 2.3 Bending moment and shear force in the bulkhead corrugations

### 2.3.1 General

The bending moment  $M$  and the shear force  $Q$  in the bulkhead corrugations are obtained using the formulae given in [2.3.2] and [2.3.3]. The  $M$  and  $Q$  values are to be used for the checks in [2.4].

### 2.3.2 Bending moment

The design bending moment  $M$ , in kN.m, for the bulkhead corrugations is given by:

$$M = \frac{F \ell}{8}$$

where:

$F$ : Resultant force in kN, as given in [2.2.6] or [2.2.7]

$\ell$ : Span of the corrugation, in m, to be taken according to Fig 2 and Fig 3.

## 2.4 Strength criteria

### 2.4.1 General

The following criteria are applicable to transverse bulkheads with vertical corrugations (see Fig 2).

Requirements for local net plate thickness are given in [2.4.8].

In addition, the criteria given in [2.4.2] and [2.4.5] are to be complied with.

Where the corrugation angle  $\phi$  shown in Fig 2 is less than  $50^\circ$ , a horizontal row of staggered shedder plates is to be fitted at approximately mid-depth of the corrugations (see Fig 2) to help preserve dimensional stability of the bulkhead under flooding loads. The shedder plates are to be welded to the corrugations by double continuous welding, but they are not to be welded to the side shell.

The thicknesses of the lower part of corrugations considered in the application of [2.4.2] and [2.4.3] are to be maintained for a distance from the inner bottom (if no lower stool is fitted) or the top of the lower stool not less than  $0,15 \ell$ .

The thicknesses of the middle part of corrugations considered in the application of [2.4.2] and [2.4.4] are to be maintained to a distance from the deck (if no upper stool is fitted) or the bottom of the upper stool not greater than  $0,3 \ell$ .

### 2.4.2 Bending capacity and shear stress $\tau$

The bending capacity is to comply with the following relationship:

$$10^3 \frac{M}{0,5 Z_{le} \sigma_{a,le} + Z_m \sigma_{a,m}} \leq 1,0$$

where:

$M$  : Bending moment, in kN.m, as given in [2.3.2]

$Z_{le}$  : Section modulus of one half pitch corrugation, in  $\text{cm}^3$ , at the lower end of corrugations, to be calculated according to [2.4.3]

$Z_m$  : Section modulus of one half pitch corrugation, in  $\text{cm}^3$ , at the mid-span of corrugations, to be calculated according to [2.4.4]

$\sigma_{a,le}$  : Allowable stress, in  $\text{N/mm}^2$ , as given in [2.4.5], for the lower end of corrugations

$\sigma_{a,m}$  : Allowable stress, in  $\text{N/mm}^2$ , as given in [2.4.5], for the mid-span of corrugations.

In no case is  $Z_m$  to be taken greater than the lesser of  $1,15 Z_{le}$  and  $1,15 Z'_{le}$  for calculation of the bending capacity,  $Z'_{le}$  being defined below.

Where effective shedders plates are fitted which:

- are not knuckled
- are welded to the corrugations and the top of the lower stool by one side penetration welds or equivalent
- are fitted with a minimum slope of  $45^\circ$  and their lower edge is in line with the stool side plating,

or effective gusset plates are fitted which:

- are fitted in line with the stool side plating
- have material properties at least equal to those provided for the flanges,

the section modulus  $Z_{le}$ , in  $\text{cm}^3$ , is to be taken not larger than the value  $Z'_{le}$ , in  $\text{cm}^3$ , given by:

$$Z'_{le} = Z_g + 10^3 \frac{Q h_g - 0,5 h_g^2 s_1 p_g}{\sigma_a}$$

where:

$Z_g$  : Section modulus of one half pitch corrugation, in  $\text{cm}^3$ , according to [2.4.4], in way of the upper end of shedder or gusset plates, as applicable

$Q$  : Shear force, in kN, as given in [2.3.3]

$h_g$  : Height, in m, of shedders or gusset plates, as applicable (see Fig 4, Fig 5, Fig 6, Fig 7 and Fig 8)

$s_1$  : As given in [2.2.3], item a)

$p_g$  : Resultant pressure, in  $\text{kN/m}^2$ , as defined in [2.2.6] and [2.2.7], calculated in way of the middle of the shedders or gusset plates, as applicable

$\sigma_a$  : Allowable stress, in  $\text{N/mm}^2$ , as given in [2.4.5].

Stresses  $\tau$  are obtained by dividing the shear force  $Q$  by the shear area. The shear area is to be reduced in order to account for possible non-perpendicularity between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by  $(\sin\phi)$ ,  $\phi$  being the angle between the web and the flange.

When calculating the section moduli and the shear area, the net plate thicknesses are to be used.

The section moduli of corrugations are to be calculated on the basis of the requirements given in [2.4.3] and [2.4.4].

### 2.4.3 Section modulus at the lower end of corrugations

The section modulus is to be calculated with the compression flange having an effective flange width,  $b_{ef}$ , not larger than as given in [2.4.6].

If the corrugation webs are not supported by local brackets below the stool top (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30% effective.

- a) Provided that effective shedder plates, as defined in [2.4.2], are fitted (see Fig 4 and Fig 5), when calculating the section modulus of corrugations at the lower end (cross-section 1 in Fig 4 and Fig 5), the area of flange plates, in cm<sup>2</sup>, may be increased by the following value (which is not to be taken greater than 2,5 a t<sub>f</sub>):

$$2,5 a \sqrt{t_f t_{sh}} \sqrt{\frac{\sigma_{Fsh}}{\sigma_{Ffl}}}$$

where:

- a : Width, in m, of the corrugation flange (see Fig 2)
  - t<sub>sh</sub> : Net shedder plate thickness, in mm
  - t<sub>f</sub> : Net flange thickness, in mm
  - σ<sub>Fsh</sub> : Minimum upper yield stress, in N/mm<sup>2</sup>, of the material used for the shedder plate
  - σ<sub>Ffl</sub> : Minimum upper yield stress, in N/mm<sup>2</sup>, of the material used for the corrugation flanges.
- b) Provided that effective gusset plates, as defined in [2.4.2], are fitted (see Fig 6, Fig 7 and Fig 8) when calculating the section modulus of corrugations at the lower end (cross-section 1 in Fig 6, Fig 7 and Fig 8), the area of flange plates, in cm<sup>2</sup>, may be increased by 7 h<sub>g</sub> t<sub>gu</sub>, where:
- h<sub>g</sub> : Height of gusset plate in m, see Fig 6, Fig 7 and Fig 8, not to be taken greater than s<sub>gu</sub> / 0,7
  - s<sub>gu</sub> : Width of the gusset plates, in mm
  - t<sub>gu</sub> : Net gusset plate thickness, in mm, not to be taken greater than t<sub>f</sub>
  - t<sub>f</sub> : Net flange thickness, in mm, based on the as-built condition.
- c) If the corrugation webs are welded to a sloping stool top plate, which is at an angle not less than 45° with the horizontal plane, the section modulus of the corrugations may be calculated considering the corrugation webs fully effective. Where effective gusset plates are fitted, when calculating the section modulus of corrugations the area of flange plates may be increased as specified in b) above. No credit can be given to shedder plates only.  
For angles less than 45°, the effectiveness of the web may be obtained by linear interpolation between 30% for 0° and 100% for 45°.

**Figure 4 : Symmetrical shedder plates**

**Figure 5 : Asymmetrical shedder plates**

Figure 6 : Symmetrical gusset/shedder plates

Figure 7 : Asymmetrical gusset/shedder plates

Figure 8 : Asymmetrical gusset/shedder plates - Sloping stool top plate

#### 2.4.4 Section modulus of corrugations at cross-sections other than the lower end

The section modulus is to be calculated with the corrugation webs considered effective and the compression flange having an effective flange width not larger than as given in [2.4.6].

#### 2.4.5 Allowable stress check

The normal and shear stresses  $\sigma$  and  $\tau$  are not to exceed the allowable values  $\sigma_a$  and  $\tau_a$ , in N/mm<sup>2</sup>, given by:

$$\sigma_a = \sigma_F$$

$$\tau_a = 0,5 \sigma_F$$

where:

$\sigma_F$  : Minimum upper yield stress, in N/mm<sup>2</sup>, of the material.

#### 2.4.6 Effective width of the compression flange of corrugations

The effective width  $b_{ef}$ , in m, of the corrugation flange is given by:  $b_{ef} = C_e a$

where:

$$C_e = \frac{2,25}{\beta} - \frac{1,25}{\beta^2} \quad \text{for } \beta > 1,25$$

$$C_e = 1 \quad \text{for } \beta \leq 1,25$$

$$\beta = 10^3 \frac{a}{t_f} \sqrt{\frac{\sigma_F}{E}}$$

$t_f$  : Net flange thickness, in mm

$a$  : As given in [2.4.2]

$\sigma_F$  : Minimum upper yield stress, in N/mm<sup>2</sup>, of the material

$E$  : Modulus of elasticity, in N/mm<sup>2</sup>, to be assumed equal to 206000 N/mm<sup>2</sup> for steel.

#### 2.4.7 Shear buckling check

The buckling check is to be performed for the web plates at the corrugation ends.

The shear stress  $\tau$  is not to exceed the critical value  $\tau_C$ , in N/mm<sup>2</sup>, obtained as follows:

$$\tau_C = \tau_E \quad \text{for } \tau_E \leq \frac{\tau_F}{2}$$

$$\tau_C = \tau_F \left(1 - \frac{\tau_F}{4\tau_E}\right) \quad \text{for } \tau_E > \frac{\tau_F}{2}$$

$$\tau_F = \frac{\sigma_F}{\sqrt{3}}$$

where:

$\sigma_F$  : Minimum upper yield stress, in N/mm<sup>2</sup>, of the material

$$\tau_E = 0,9 k_t E \left(\frac{t}{1000c}\right)^2$$

$$k_t = 6,34$$

$E$  : Modulus of elasticity, in N/mm<sup>2</sup>, as given in [2.4.6]

$t$  : Net thickness, in mm, of corrugation web

$c$  : Width, in m, of corrugation web (see Fig 2).

#### 2.4.8 Local net plate thickness

The bulkhead local net plate thickness  $t$ , in mm, is given by:

$$t = 14,9 s_w \sqrt{\frac{p}{\sigma_F}}$$

where:

$s_w$  : Plate width, in m, to be taken equal to the width of the corrugation flange or web, whichever is the greater (see Fig 2)

$p$  : Resultant pressure, in kN/m<sup>2</sup>, as defined in [2.2.6] and [2.2.7], at the bottom of each strake of plating; in all cases, the net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool or at the inner bottom, if no lower stool is fitted, or at the top of shedders, if shedder or gusset/shedder plates are fitted

$\sigma_F$  : Minimum upper yield stress, in N/mm<sup>2</sup>, of the material.

For built-up corrugation bulkheads, when the thicknesses of the flange and web are different, the net thickness of the narrower plating is to be not less than  $t_n$ , in mm, given by:

$$t_n = 14,9 s_n \sqrt{\frac{p}{\sigma_F}}$$

where:

$s_n$  : Width, in m, of the narrower plating.

The net thickness of the wider plating, in mm, is not to be taken less than the maximum of the following values:

$$t_w = 14,9 s_w \sqrt{\frac{p}{\sigma_F}}$$

$$t_w = \sqrt{\frac{440 s_w^2 p}{\sigma_F} - t_{np}^2}$$

where:

$t_{np}$  : Thickness, in mm, less or equal to the actual net thickness of the narrower plating and not to be greater than:

$$14,9 s_w \sqrt{\frac{p}{\sigma_F}}$$

## 2.5 Local details

### 2.5.1 General

As applicable, the design of local details is to comply with the Society's requirements for the purpose of transferring the corrugated bulkhead forces and moments to the boundary structures, especially to the double bottom and cross-deck structures.

In particular, the thickness and stiffness of gusset and shedder plates, as defined in [2.4.3], installed for strengthening purposes, are to comply with the Society's requirements on the basis of the load model in [2.2].

Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the Society's requirements.

## 2.6 Steel renewal

### 2.6.1 General

Renewal/reinforcement is to be carried out in accordance with the following requirements and the guidelines contained in [3].

**2.6.2** Steel renewal is required where the gauged thickness is less than  $(t_{net} + 0,5)$  mm,  $t_{net}$  being the thickness used for the calculation of bending capacity and shear stresses as given in [2.4.2] or the local net plate thickness as given in [2.4.8]. Alternatively, reinforcing doubling strips may be used providing the net thickness is not dictated by shear strength requirements for web plates (see [2.4.5] and [2.4.7]) or by local pressure requirements for web and flange plates (see [2.4.8]).

Where steel renewal is required, the bulkhead connections to the lower stool shelf plate (or inner bottom, if no stool is fitted) are to be made at least by deep penetration welds (see Fig 9).

Where the gauged thickness is within the range  $(t_{net} + 0,5)$  mm and  $(t_{net} + 1,0)$  mm, coating (applied in accordance with the coating Manufacturer's specifications) or annual gauging may be adopted as an alternative to steel renewal.

Figure 9 : Deep penetration welds of shedder and gusset plates

**2.6.3** Where steel renewal or reinforcement is required, a minimum thickness of  $(t_{net} + 2,5)$  mm is to be replenished for the renewed or reinforced parts.

**2.6.4** Gussets with shedder plates, extending from the lower end of corrugations up to  $0,1 \ell$ , or reinforcing doubling strips (on bulkhead corrugations and stool side plating) are to be fitted when:

$$\frac{\sigma_{Fs} t_{st}}{\sigma_{Ffil} t_{fil}} \leq 0,8$$

where:

$\sigma_{Ffil}$  : Minimum upper yield stress, in  $N/mm^2$ , of the material used for the corrugation flanges

- $\sigma_{Fs}$  : Minimum upper yield stress, in N/mm<sup>2</sup>, of the material used for the lower stool side plating (or floors, if no stool is fitted)
- $t_{fl}$  : Flange thickness, in mm, which is found to be acceptable on the basis of the criteria specified in [2.6.2] or, when steel renewal is required, the replenished thickness according to the criteria specified in [2.6.3]. The above flange thickness dictated by local pressure requirements (see [2.4.8]) need not be considered for this purpose
- $t_{st}$  : As-built thickness, in mm, of the lower stool side plating (or floors, if no stool is fitted).

If gusset plates are fitted, their material is to be the same as that of the corrugation flanges. The gusset plates are to be connected to the lower stool shelf plate (or inner bottom, if no lower stool is fitted) by deep penetration welds (see Fig 9).

Where gusset plates are to be fitted or renewed, their connections with the corrugations and the lower stool shelf plate (or inner bottom, if no stool is fitted) are to be made at least by deep penetration welds (see Fig 9).

### **3 Guidance on renewal/reinforcement of the transverse watertight vertically corrugated bulkhead between the two foremost cargo holds**

#### **3.1**

**3.1.1** The need for renewal or reinforcement of the transverse watertight vertically corrugated bulkhead between the two foremost cargo holds will be determined by the Society on a case-by-case basis using the criteria given in [2] in association with the most recent gaugings and survey findings.

**3.1.2** In addition to Rule requirements, the assessment of the transverse corrugated bulkhead based on the criteria given in [2] will take into account the following:

- scantlings of individual vertical corrugations will be assessed for reinforcement/renewal based on thickness measurements obtained in accordance with Ch 6, Sec 2, [1.3] at their lower end, at mid-depth and in way of plate thickness changes in the lower 70%. These considerations will take into account the provision of gussets and shedder plates and the benefits they offer, provided that they comply with [2.4.2] and [2.6].
- taking into account the scantlings and arrangements for each case, permissible levels of diminution will be determined and appropriate measures taken in accordance with [2.6].

**3.1.3** Where renewal is required, its extent is to be shown clearly in plans. The vertical distance of each renewal zone is to be determined by considering the criteria given in [2] and is generally to be not less than 15% of the vertical distance between the upper and lower end of the corrugation measured at the ship's centreline.

**3.1.4** Where the reinforcement is accepted by adding strips, the length of the reinforcing strips is to be sufficient to extend over the whole depth of the diminished plating. In general, the width and thickness of strips are to be sufficient to comply with the criteria given in [2]. The material of the strips is to be the same as that of the corrugation plating. The strips are to be attached to the existing bulkhead plating by continuous fillet welds. The strips are to be suitably tapered or connected at ends in accordance with the usual welding practice to the Surveyor's satisfaction.

**3.1.5** Where reinforcing strips are connected to the inner bottom or lower stool shelf plates, one side full penetration welding is to be used. When reinforcing strips are fitted to the corrugation flange and are connected to the lower stool shelf plate, they are normally to be aligned with strips of the same scantlings welded to the stool side plating and having a minimum length equal to the breadth of the corrugation flange.

**3.1.6** Fig 10 gives a general arrangement of structural reinforcement. When such reinforcement is carried out, the following applies:

- square or trapezoidal corrugations are to be reinforced with plate strips fitted to each corrugation flange sufficient to meet the requirements given in [2]
- the number of strips fitted to each corrugation flange is to be sufficient to meet the requirements given in [2]
- the shedder plate may be fitted in one piece or prefabricated with a welded knuckle (gusset plate)
- gusset plates, where fitted, are to be welded to the shelf plate in line with the flange of the corrugation, to reduce the stress concentrations at the corrugation corners. Good alignment is to be ensured between gusset plates, corrugation flanges and lower stool sloping plates. Deep penetration welding is to be used at all connections. Start and stop of welding are to be as far away as possible from corners of corrugations
- shedder plates are to be attached by one side full penetration welds onto backing bars
- shedder and gusset plates are to have a thickness equal to or greater than the original bulkhead thickness. Gusset plates are to have a minimum height (on the vertical part) equal to half of the width of the corrugation flange. Sheddens and gussets are to be of the same material as that of the flange.

Figure 10 : Reinforcement of vertically corrugated bulkhead

Reinforcement strips with shedder plate

Weld of reinforcement strip to shelf plate

Reinforcement strips with shedder and gusset plates

## 4 Evaluation of allowable hold loading of the foremost cargo hold with the same cargo hold flooded

### 4.1 Application and definitions

4.1.1 These requirements apply to bulk carriers:

- of single side skin construction
- of 150 metres in length and above
- intended to carry solid bulk cargoes having a bulk density of 1,78 t/m<sup>3</sup> or above
- contracted for construction prior to 1<sup>st</sup> July 1998, and not constructed in compliance with the applicable requirements for new buildings contracted after that date, and given in Pt D, Ch 4, Sec 3.

4.1.2 The loading in the foremost cargo hold is not to exceed the allowable hold loading in the flooded condition, calculated as per [4.4], using the loads given in [4.2] and the shear capacity of the double bottom given in [4.3].

In no case is the allowable hold loading in flooding condition to be taken greater than the design hold loading in intact condition.

### 4.2 Load model

#### 4.2.1 General

The loads to be considered as acting on the double bottom of the foremost cargo hold are those given by the external sea pressures and the combination of the cargo loads with those induced by the flooding of the foremost cargo hold itself.

The most severe combinations of cargo induced loads and flooding loads are to be used, depending on the loading conditions included in the loading manual:

- homogeneous loading conditions
- non-homogeneous loading conditions
- packed cargo conditions, such as steel mill products.

For each loading condition, the maximum bulk cargo density to be carried is to be considered in calculating the allowable hold limit.

#### 4.2.2 Inner bottom flooding head

The flooding head  $h_f$  (see Fig 11) is the distance, in m, measured vertically with the ship in the upright position, from the inner bottom to a level located at a distance  $d_f$ , in m, from the base line equal to:

- $D$  in general
- $0,95 D$  for ships less than 50,000 tonnes deadweight with type B freeboard,

$D$  being the distance, in m, from the base line to the freeboard deck at side amidships (see Fig 11).

**Figure 11 : Calculation of pressure on the inner bottom in the flooded cargo hold**

$V$  = Volume of cargo

### 4.3 Shear capacity of the double bottom of the foremost cargo hold

#### 4.3.1 General

The shear capacity  $C$  of the double bottom of the foremost cargo hold is defined as the sum of the shear strength at each end of:

- all floors adjacent to both hoppers, less one half of the strength of the two floors adjacent to each stool, or transverse bulkhead if no stool is fitted (see Fig 12)
- all double bottom girders adjacent to both stools, or transverse bulkheads if no stool is fitted.

The strength of girders or floors which run out and are not directly attached to the boundary stool or hopper girder is to be evaluated for the one end only.

Note 1: The floors and girders to be considered are those inside the hold boundaries formed by the hoppers and stools (or transverse bulkheads if no stool is fitted). The hopper side girders and the floors directly below the connection of the bulkhead stools (or transverse bulkheads if no stool is fitted) to the inner bottom are not to be included.

Note 2: When the geometry and/or the structural arrangement of the double bottom is such as to make the above assumptions inadequate, at the Society's discretion, the shear capacity  $C$  of the double bottom is to be calculated by means of direct calculations to be carried out according to Pt B, Ch 7, Sec 6, as far as applicable.

In calculating the shear strength, the net thicknesses of floors and girders are to be used. The net thickness  $t_{net}$ , in mm, is given by:

$$t_{net} = t - t_c$$

where:

- $t$  : As-built thickness, in mm, of floors and girders
- $t_c$  : Corrosion diminution, equal to 2 mm, in general; a lower value of  $t_c$  may be adopted, provided that measures are taken, to the Society's satisfaction, to justify the assumption made.

Figure 12 : Double bottom structure

#### 4.3.2 Floor shear strength

The floor shear strength in way of the floor panel adjacent to hoppers  $S_{f1}$ , in kN, and the floor shear strength in way of the openings in the outermost bay (i.e. that bay which is closest to the hopper)  $S_{f2}$ , in kN, are given by the following expressions:

$$S_{f1} = 10^{-3} A_f \frac{\tau_a}{\eta_1}$$

$$S_{f2} = 10^{-3} A_{f,h} \frac{\tau_a}{\eta_2}$$

where:

- $A_f$  : Sectional area, in mm<sup>2</sup>, of the floor panel adjacent to hoppers
- $A_{f,h}$  : Net sectional area, in mm<sup>2</sup>, of the floor panels in way of the openings in the outermost bay (i.e. that bay which is closest to the hopper)

$\tau_a$  : Allowable shear stress, in N/mm<sup>2</sup>, to be taken equal to:

$$\tau_a = \frac{\sigma_F}{\sqrt{3}}$$

$\sigma_F$  : Minimum upper yield stress, in N/mm<sup>2</sup>, of the material

$\eta_1$  :  $\eta_1 = 1,10$

$\eta_2$  :  $\eta_2 = 1,20$

$\eta_2$  may be reduced, at the Society's discretion, down to 1,10 where appropriate reinforcements are fitted to the Society's satisfaction.

### 4.3.3 Girder shear strength

The girder shear strength in way of the girder panel adjacent to stools (or transverse bulkheads, if no stool is fitted)  $S_{g1}$ , in kN, and the girder shear strength in way of the largest opening in the outermost bay (i.e. that bay which is closest to the stool, or transverse bulkhead, if no stool is fitted)  $S_{g2}$ , in kN, are given by the following expressions:

$$S_{g1} = 10^{-3} A_g \frac{\tau_a}{\eta_1}$$

$$S_{g2} = 10^{-3} A_{g,h} \frac{\tau_a}{\eta_2}$$

where:

$A_g$  : Minimum sectional area, in mm<sup>2</sup>, of the girder panel adjacent to stools (or transverse bulkheads if no stools are fitted)

$A_{g,h}$  : Net sectional area, in mm<sup>2</sup>, of the girder panel in way of the largest opening in the outermost bay (i.e. that bay which is closest to the stool, or transverse bulkhead, if no stool is fitted)

$\tau_a$  : Allowable shear stress, in N/mm<sup>2</sup>, as given in [4.3.2]

$\eta_1$  :  $\eta_1 = 1,10$

$\eta_2$  :  $\eta_2 = 1,15$

$\eta_2$  may be reduced, at the Society's discretion, down to 1,10 where appropriate reinforcements are fitted to the Society's satisfaction.

## 4.4 Allowable hold loading

**4.4.1** The allowable hold loading  $W$ , in t, is given by:

$$W = \rho_c V \frac{1}{F}$$

where:

$F$  : Equal to 1,05 in general (for steel mild products,  $F = 1,0$ )

$\rho_c$  : Cargo density, in t/m<sup>3</sup>; for bulk cargoes see [4.2.1]; for steel products,  $\rho_c$  is to be taken as the density of steel

$V$  : Volume, in m<sup>3</sup>, occupied by cargo at a level  $h_1$  given by:

$$h_1 = \frac{X}{\rho_c g}$$

where:

$X$  : For bulk cargoes, is the lesser of  $X_1$  and  $X_2$  given by:

$$X_1 = \frac{Z + \rho g (E - h_f)}{1 + \frac{\rho}{\rho_c} (\text{perm} - 1)}$$

$$X_2 = Z + \rho g (E - h_f \text{perm})$$

Note 1: For steel products,  $X$  may be taken equal to  $X_1$ , using  $\text{perm} = 0$

$\rho$  : Sea water density, in t/m<sup>3</sup>

$g$  : 9,81 m/s<sup>2</sup>, gravity acceleration

$E$  :  $E = d_i - 0,1 D$  with  $d_i$  and  $D$  as given in [4.2.2]

$h_f$  : Flooding head, in m, as defined in [4.2.2]

$\text{perm}$  : Permeability of cargo, to be taken as 0,3 for ore (corresponding bulk cargo density for iron ore may generally be taken as 3,0 t/m<sup>3</sup>)

$Z$  : The lesser of  $Z_1$  and  $Z_2$  given by:

$$Z_1 = \frac{C_h}{A_{DB,h}}$$

$$Z_2 = \frac{C_e}{A_{DB,e}}$$

with:

- $C_h$  : Shear capacity of the double bottom, in kN, as defined in [4.3], considering, for each floor, the lesser of the shear strengths  $S_{f1}$  and  $S_{f2}$  (see [4.3.2]) and, for each girder, the lesser of the shear strengths  $S_{g1}$  and  $S_{g2}$  (see [4.3.3])
- $C_e$  : Shear capacity of the double bottom, in kN, as defined in [4.3], considering, for each floor, the shear strength  $S_{f1}$  (see [4.3.2]) and, for each girder, the lesser of the shear strengths  $S_{g1}$  and  $S_{g2}$  (see [4.3.3])

$$A_{DB,h} : A_{DB,h} = \sum_{i=1}^{n+1} S_i B_{DB,i}$$

$$A_{DB,e} : A_{DB,e} = \sum_{i=1}^{n+1} S_i (B_{DB} - s)$$

where:

- $n$  : Number of floors between stools (or transverse bulkheads, if no stools are fitted)
- $S_i$  : Space of the  $i$ th-floor, in m
- $B_{DB,i}$  : • for floors whose shear strength is given by  $S_{f1}$  (see [4.3.2]):  $B_{DB,i} = B_{DB} - s$   
 • for floors whose shear strength is given by  $S_{f2}$  (see [4.3.2]):  $B_{DB,i} = B_{DB,h}$   
 where  $B_{DB,h}$  is the distance, in m, between the two openings considered (see Fig 13)
- $B_{DB}$  : Breadth of double bottom, in m, between hoppers (see Fig 13)
- $s$  : Spacing, in m, of double bottom longitudinals adjacent to hoppers.

**Figure 13 : Dimensions  $B_{DB}$  and  $B_{DB,h}$**

## 5 Renewal criteria for side shell frames and brackets in single side skin bulk carriers and single side skin OBO carriers not built in accordance with Part II, Chapter 8, Section 8-03 of the 1<sup>st</sup> April 1998 edition of the Rules or subsequent editions

### 5.1 Application and symbols

5.1.1 These retroactive rule requirements apply to:

- the side shell frames and brackets of cargo holds bounded by the single side shell of ships with service notation **bulk carrier ESP** constructed with single deck, topside tanks and hopper tanks in cargo spaces intended primarily to carry dry cargo in bulk
- the side shell frames and brackets of cargo holds bounded by the single side shell of ships with service notation **combination carrier/OBO ESP** as defined in Ch 1, Sec 2, [4.3.4] but of single side skin construction,

which were not built in accordance with the applicable requirements of Part II, Chapter 8, Section 8-03 of the 1<sup>st</sup> April 1998 edition of the Rules or subsequent editions.

#### 5.1.2 Symbols

- $t_M$  : Thickness as measured, in mm
- $t_{REN}$  : Thickness at which renewal is required. Refer to [5.3.1]
- $t_{REN,d/t}$  : Thickness criteria based on  $d/t$  ratio. Refer to [5.3.2]
- $t_{REN,S}$  : Thickness criteria based on strength. Refer to [5.3.3]
- $t_{COAT}$  :  $t_{COAT} = 0,75 t_{S12}$
- $t_{S12}$  : Thickness, in mm, as required in Tab 1 for side frame webs and upper and lower end bracket webs
- $t_{AB}$  : Thickness as built, in mm
- $t_C$  : As defined in Tab 2.

### 5.2 Ice strengthened ships

5.2.1 Where bulk carriers are reinforced to comply with an ice class notation, the intermediate frames are not to be included when considering compliance with the present Article.

**Table 1 :  $t_{S12}$  values, in mm**

Item	Thickness $t_{S12}$
Side frame webs	$C_L (7,0 + 0,03 L_1)$
Lower end brackets	The greater of: <ul style="list-style-type: none"> <li><math>C_L (7,0 + 0,03 L_1) + 2</math></li> <li>as-built thickness of side frame web</li> </ul>
Upper end brackets	The greater of: <ul style="list-style-type: none"> <li><math>C_L (7,0 + 0,03 L_1)</math></li> <li>as-built thickness of side frame web</li> </ul>
<b>Note 1:</b>	
$C_L$	: Coefficient equal to: <ul style="list-style-type: none"> <li>1,15 for side frames in way of the foremost cargo hold</li> <li>1,0 for side frames in way of other cargo holds</li> </ul>
$L_1$	: Ship's length, in m, defined in Pt B, Ch 1, Sec 3, Tab 1.

**Table 2 :  $t_c$  values, in mm**

Ship's length $L$ , in m	Holds other than No.1		Hold No.1	
	Span and upper brackets	Lower brackets	Span and upper brackets	Lower brackets
$\leq 100$	2,0	2,5	2,0	3,0
150	2,0	3,0	3,0	3,5
$\geq 200$	2,0	3,0	3,0	4,0

Note: For intermediate ship lengths,  $t_c$  is obtained by linear interpolation between the above values.

**5.2.2** The renewal thicknesses for the additional structure required to meet the ice strengthening notation are to be based on the Society's requirements.

**5.2.3** If the ice class notation is requested to be withdrawn, the additional ice strengthening structure, with the exception of tripping brackets as required in [5.3.2], item b) and [5.4.2], is not to be considered to contribute to compliance with the present Article.

### 5.3 Criteria for renewal

#### 5.3.1 General

The webs of side shell frames and brackets are to be renewed when the measured thickness ( $t_M$ ) is equal to or less than the thickness ( $t_{REN}$ ) as defined below:

- $t_{REN}$  : The greatest of:
- $t_{COAT} - t_C$
  - $0,75 t_{AB}$
  - $t_{REN,d/t}$  (applicable to Zone A and B only) as defined in [5.3.2]
  - $t_{REN,S}$  where required by [5.3.3] and as defined in [5.5.4].

The measures are given in [5.3.4] and [5.3.5].

The criteria for frames and brackets are given in [5.3.6].

#### 5.3.2 Thickness criteria based on d/t ratio

Subject to items b) and c) below  $t_{REN,d/t}$  is given by the following formula:

$$t_{REN,d/t} = \frac{d}{R}$$

where:

- $d$  : Web depth, in mm
- $R$  : Coefficient given as follows:
- frames:
    - $65 k^{0,5}$  for symmetrically flanged frames
    - $55 k^{0,5}$  for asymmetrically flanged frames
  - lower brackets (see item a) below):

87  $k^{0.5}$  for symmetrically flanged frames

73  $k^{0.5}$  for asymmetrically flanged frames

k : Coefficient given in Pt B, Ch 4, Sec 1, [2.2]

k = 1 for ordinary hull structural steel.

In no instance is  $t_{REN,d/t}$  for lower integral brackets to be taken as less than  $t_{REN,d/t}$  for the frames they support.

a) Lower brackets

Lower brackets are to be flanged or face plate is to be fitted. Refer to [5.3.6].

In calculating the web depth of the lower brackets, the following items apply:

- The web depth of lower bracket may be measured from the intersection of the sloped bulkhead of the hopper tank and the side shell plate, perpendicularly to the face plate of the lower bracket (refer to Fig 14)
- Where stiffeners are fitted on the lower bracket plate, the web depth may be taken as the distance between the side shell and the stiffener, between the stiffeners or between the outermost stiffener and the face plate of the brackets, whichever is the greatest.

**Figure 14 : Definition of the lower bracket web depth for determining  $t_{REN,d/t}$**

b) Tripping bracket alternative

When  $t_M$  is less than  $t_{REN,d/t}$  at section b) of the side frames, tripping brackets in accordance with [5.4.2] may be fitted as an alternative to the requirements for the web depth to thickness ratio of side frames, in which case  $t_{REN,d/t}$  may be disregarded in the determination of  $t_{REN}$  in accordance with [5.3.1]. The value of  $t_M$  is to be based on zone B according to Fig 15.

**Figure 15 : Lower part and zones of side frames**

c) Immediately abaft collision bulkhead

For the side frames, including the lower bracket, located immediately abaft the collision bulkhead, whose scantlings are increased in order that their moment of inertia is such to avoid undesirable flexibility of the side shell, when their web as built thickness  $t_{AB}$  is greater than  $1,65t_{REN,S}$  the thickness  $t_{REN,d/t}$  may be taken as the value  $t'_{REN,d/t}$  obtained from the following formula:

$$t'_{REN,d/t} = \sqrt[3]{t_{REN,d/t}^2 \cdot t_{REN,S}}$$

where  $t_{REN,S}$  is obtained from [5.5.4].

**5.3.3 Thickness criteria based on shear strength check**

Where  $t_M$  in the lower part of side frames, as defined in Fig 15, is equal to or less than  $t_{COAT}$ ,  $t_{REN,S}$  is to be determined in accordance with [5.5.4].

**5.3.4 Thickness of renewed webs of frames and lower brackets**

Where steel renewal is required, the renewed webs are to be of a thickness not less than  $t_{AB}$ ,  $1,2t_{COAT}$  or  $1,2t_{REN}$ , whichever is the greatest.

**5.3.5 Criteria for other measures**

When  $t_{REN} < t_M \leq t_{COAT}$ , measures are to be taken, consisting of all the following items:

- a) sand blasting, or equivalent, and coating (refer to [5.4.1])
- b) Fitting tripping brackets (refer to [5.4.2]), when the above condition occurs for any of the side frame zones A, B, C and D, as shown in Fig 15. Tripping brackets not connected to flanges are to have soft toe, and the distance between the bracket toe and the frame flange is not to be greater than about 50 mm, see Fig 16, and
- c) Maintaining the coating in "as-new" condition (i.e. without breakdown or rusting) at class renewal and intermediate surveys. The above measures may be waived if the structural members show no thickness diminution with respect to the as built thicknesses and coating is in "as-new" condition (i.e. without breakdown or rusting).

When the measured frame webs thickness  $t_M$  is such that  $t_{REN} < t_M \leq t_{COAT}$  and the coating is in GOOD condition, sand blasting and coating as required in a) above may be waived even if not found in "as-new" condition, as defined above, provided that tripping brackets are fitted and the coating damaged in way of the tripping bracket welding is repaired.

**Figure 16 : Tripping brackets**

x : Distance from knuckle not greater than 200 mm.

### **5.3.6 Criteria for frames and brackets (bending check)**

When lower end brackets were not fitted with flanges at the design stage, flanges are to be fitted so as to meet the bending strength requirements in [5.5.5]. The full width of the bracket flange is to extend up beyond the point at which the frame flange reaches full width. Adequate back-up structure in the hopper is to be ensured, and the bracket is to be aligned with the back-up structure.

Where the length or depth of the lower bracket does not meet the requirements in Pt D, Ch 4, Sec 3, [2.2.5], a bending strength check in accordance with [5.5.5] is to be carried out and renewals or reinforcements of frames and/or brackets effected as required therein.

The bending check needs not to be carried out in the case the bracket geometry is modified so as to comply with Pt D, Ch 4, Sec 3, [2.2.5] requirements.

## **5.4 Other measures**

### **5.4.1 Thickness measurements, steel renewal, sand blasting and coating**

For the purpose of steel renewal, sand blasting and coating, four zones A, B, C and D are defined, as shown in Fig 15. When renewal is to be carried out, surface preparation and coating are required for the renewed structures as given in Pt D, Ch 4, Sec 3, [6.1] for cargo holds of new buildings.

Representative thickness measurements are to be taken for each zone and are to be assessed against the criteria in [5.3].

When zone B is made up of different plate thicknesses, the lesser thickness is to be used for the application of the requirements in this Article [5].

In case of integral brackets, when the criteria in [5.3] are not satisfied for zone A or B, steel renewal, sand blasting and coating, as applicable, are to be done for both zones A and B.

In case of separate brackets, when the criteria in [5.3] are not satisfied for zone A or B, steel renewal, sand blasting and coating is to be done for each one of these zones, as applicable.

When steel renewal is required for zone C according to [5.3], it is to be done for both zones B and C. When sand blasting and coating is required for zone C according to [5.3], it is to be done for zones B, C and D.

When steel renewal is required for zone D according to [5.3], it needs only to be done for this zone. When sand blasting and coating is required for zone D according to [5.3], it is to be done for both zones C and D.

Special consideration may be given by the Society to zones previously renewed or recoated, if found in "as-new" condition (i.e. without breakdown or rusting).

When adopted, on the basis of the renewal thickness criteria in [5.3], in general coating is to be applied in compliance with the requirements of Ch 4, Sec 2, [1.1.7], as applicable.

Where, according to the requirements in [5.3], a limited number of side frames and brackets are shown to require coating over part of their length, the following criteria apply:

- a) The part to be coated includes:
  - the web and the face plate of the side frames and brackets,
  - the hold surface of side shell, hopper tank and topside tank plating, as applicable, over a width not less than 100 mm from the web of the side frame.
- b) Epoxy coating or equivalent is to be applied.

In all cases, all the surfaces to be coated are to be sand blasted prior to coating application.

When flanges of frames or brackets are to be renewed according to the retroactive rule requirements, the outstanding breadth to thickness ratio is to comply with Pt D, Ch 4, Sec 3, [2.2.3] and Pt D, Ch 4, Sec 3, [2.2.4].

### **5.4.2 Reinforcing measures**

Reinforcing measures are constituted by tripping brackets, located at the lower part and at midspan of side frames (see Fig 16). Tripping brackets may be located at every two frames, but lower and midspan brackets are to be fitted in line between alternate pairs of frames.

The thickness of the tripping brackets is to be not less than the as-built thickness of the side frame webs to which they are connected.

Double continuous welding is to be adopted for the connections of tripping brackets to the side shell frames and shell plating.

Where side frames and side shell are made of Higher Strength Steel (HSS), Normal Strength Steel (NSS) tripping brackets may be accepted, provided the electrodes used for welding are those required for the particular HSS grade, and the thickness of the tripping brackets is equal to the frame web thickness, regardless of the frame web material.

### **5.4.3 Weld throat thickness**

In case of steel renewal the welded connections are to comply with Pt D, Ch 4, Sec 3, [7].

### **5.4.4 Pitting and grooving**

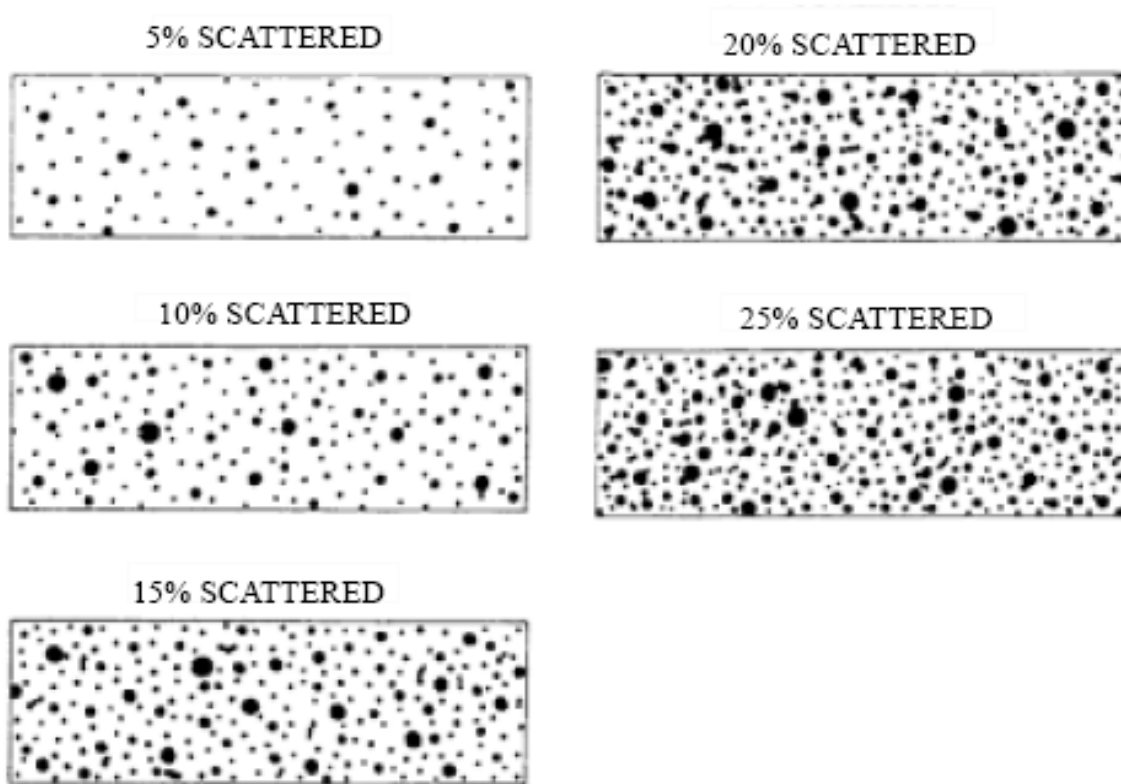

If pitting intensity is higher than 15% in area (see Fig 17), thickness measurement is to be taken to check pitting corrosion.

The minimum acceptable remaining thickness in pits or grooves is equal to:

- 75% of the as built thickness, for pitting or grooving in the frame and brackets webs and flanges
- 70% of the as built thickness, for pitting or grooving in the side shell, hopper tank and topside tank plating attached to the side frame, over a width up to 30 mm from each side of it.

Figure 17 : Pitting intensity diagrams (from 5% to 25% intensity)

#### 5.4.5 Renewal of all frames in one or more cargo holds

When all frames in one or more holds are required to be renewed according to the retroactive rule requirements, the compliance with the applicable requirements of Part II, Chapter 8, Section 8-03 of the first April 1998 edition of the Rules may be accepted in lieu of the compliance with the retroactive rule requirements, provided that:

- It is applied at least to all the frames of the hold(s)
- The coating requirements for side frames of “new ships” are complied with
- The section modulus of side frames is calculated according to the relevant requirements of the Rules.

#### 5.4.6 Renewal of damaged frames

In case of renewal of a damaged frame already complying with this Article [5], the following requirements apply:

- The conditions accepted in compliance with this Article are to be restored as a minimum.
- For localised damages, the extension of the renewal is to be carried out according to the standard practice of the Society.

### 5.5 Strength check criteria

5.5.1 In general, loads are to be calculated and strength checks are to be carried out for the aft, middle and forward frames of each hold. The scantlings required for frames in intermediate positions are to be obtained by linear interpolation between the results obtained for the above frames.

When scantlings of side frames vary within a hold, the required scantlings are also to be calculated for the mid frame of each group of frames having the same scantlings. The scantlings required for frames in intermediate positions are to be obtained by linear interpolation between the results obtained for the calculated frames.

#### 5.5.2 Load model

The following loading conditions are to be considered:

- homogeneous heavy cargo (density > 1.78 t/m<sup>3</sup>)
- homogeneous light cargo (density < 1.78 t/m<sup>3</sup>)
- non homogeneous heavy cargo, if allowed.

Multi port loading/unloading conditions need not be considered.

a) Forces

The forces  $P_{fr,a}$  and  $P_{fr,b}$ , in kN, to be considered for the strength checks at sections a) and b) of side frames (shown in Fig 18, in the case of separate lower brackets, section b) is at the top of the lower bracket), are given by:

$$P_{fr,a} = P_s + \max(P_1, P_2)$$

$$P_{fr,b} = P_{fr,a} \frac{h - 2h_b}{h}$$

where:

$P_s$  : Still water force, in kN.

When the upper end of the side frame span  $h$  (see Fig 15) is below the load waterline:

$$P_s = sh \left( \frac{p_{s,u} + p_{s,l}}{2} \right)$$

When the upper end of the side frame span  $h$  (see Fig 15) is at or above the load waterline:

$$P_s = sh' \left( \frac{p_{s,l}}{2} \right)$$

$P_1$  : Wave force, in kN, in head sea, given by the following formula:

$$P_1 = sh \left( \frac{p_{1,u} + p_{1,l}}{2} \right)$$

$P_2$  : Wave force, in kN, in beam sea, given by the following formula:

$$P_2 = sh \left( \frac{p_{2,u} + p_{2,l}}{2} \right)$$

$h$  : Side frame span, in m, defined in Fig 15

$h_b$  : Lower bracket length, in m, defined in Fig 18

$h'$  : Distance, in m, between the lower end of side frame span  $h$  (see Fig 15) and the load waterline

$s$  : Frame spacing, in m

$p_{s,u}$  : Still water pressure, in kN/m<sup>2</sup>, at the upper end of the side frame span  $h$  (see Fig 15)

$p_{s,l}$  : Still water pressure, in kN/m<sup>2</sup>, at the lower end of the side frame span  $h$  (see Fig 15)

$p_{1,u}$  : Wave pressure, in kN/m<sup>2</sup>, as defined in item b) below, for the upper end of the side frame span  $h$  and corresponding to force  $P_1$

$p_{1,l}$  : Wave pressure, in kN/m<sup>2</sup>, as defined in item b) below, for the lower end of the side frame span  $h$  and corresponding to force  $P_1$

$p_{2,u}$  : Wave pressure, in kN/m<sup>2</sup>, as defined in item b) below, for the upper end of the side frame span  $h$  and corresponding to force  $P_2$

$p_{2,l}$  : Wave pressure, in kN/m<sup>2</sup>, as defined in item b) below, for the lower end of the side frame span  $h$  and corresponding to force  $P_2$ .

b) Wave pressures

- Wave pressure  $p_1$

The wave pressure  $p_1$ , in kN/m<sup>2</sup>, at and below the waterline is given by:

$$p_1 = 1,50 \left[ p_{11} + 135 \frac{B}{2(B+75)} - (1,2(T-z)) \right]$$

where:

$$P_{11} = 3 k_s C + k_f$$

The wave pressure  $p_1$ , in kN/m<sup>2</sup>, above the waterline is given by:  $p_1 = p_{1wl} - 7,50(z - T)$

- Wave pressure  $p_2$

The wave pressure  $p_2$ , in kN/m<sup>2</sup>, at and below the waterline is given by:

$$p_2 = 13,0 \left[ 0,5B \frac{50c_r}{2(B+75)} + C_b \frac{0,5B + k_f}{14} \left( 0,7 + 2 \frac{z}{T} \right) \right]$$

The wave pressure  $p_2$ , in kN/m<sup>2</sup>, above the waterline is given by:  $p_2 = p_{2wl} - 5,0(z - T)$

where:

$p_{1wl}$  : Wave sea pressure  $p_1$  at the waterline

$p_{2wl}$  : Wave sea pressure  $p_2$  at the waterline

$L$  : Rule length, in m, as given in Pt B, Ch 1, Sec 3, [2.1.1]

$B$  : Greatest moulded breadth, in m, as given in Pt B, Ch 1, Sec 3, [2.1.4]

$C_b$  : Block coefficient, as given in Pt B, Ch 1, Sec 3, [2.1.9]

- T : Maximum design draught, in m, as given in Pt B, Ch 1, Sec 3, [2.1.6]
- C : Coefficient given as follows:
  - for  $90 \text{ m} \leq L \leq 300 \text{ m}$ 

$$C = 10,75 - \left( \frac{300 - L}{100} \right)^{1,5}$$
  - for  $L > 300 \text{ m}$ :  $C = 10,75$
- $C_r$  : Coefficient given by:
 
$$C_r = \left( 1,25 - \left( 0,025 - \frac{2k_r}{\sqrt{GM}} \right) \right) k$$
- k : Coefficient given by:
  - for ships without bilge keel  $k = 1,2$
  - for ships with bilge keel  $k = 1,0$
- $k_r$  : Roll radius of gyration. If the actual value is not available,  $k_r$  is taken equal to:
  - for ships with even distribution of mass in transverse section (e.g. alternate heavy cargo loading or homogeneous light cargo loading):  $k_r = 0,39 B$
  - for ships with uneven distribution of mass in transverse section (e.g. homogeneous heavy cargo distribution):  $k_r = 0,25 B$
- GM : If the actual value of GM is not available:  $GM = 0,12 B$
- z : Vertical distance, in m, from the baseline to the load point
- $k_s$  : Coefficient given as follows:
  - at aft end of L:
 
$$k_s = C_B + \frac{0,83}{\sqrt{C_B}}$$
  - between  $0,2 L$  and  $0,6 L$  from aft end of L:  $k_s = C_B$
  - at forward end of L:
 
$$k_s = C_B + \frac{1,33}{C_B}$$
 Between the above specified points,  $k_s$  is to be interpolated linearly
- $k_f$  : Coefficient given as follows:  $k_f = 0,8 C$

### 5.5.3 Allowable stresses

The allowable normal and shear stresses  $\sigma_a$  and  $\tau_a$ , in  $\text{N/mm}^2$ , in the side shell frames and brackets are given by:

$$\sigma_a = 0,90 R_{eH}$$

$$\tau_a = 0,40 R_{eH}$$

where  $R_{eH}$  is the minimum yield stress, in  $\text{N/mm}^2$ , of the material.

### 5.5.4 Shear strength check

Where  $t_M$  in the lower part of side frames, as defined in Fig 15, is equal to or less than  $t_{COAT}$ , shear strength check is to be carried out in accordance with the following.

The thickness  $t_{REN,S}$ , in mm, is the greater of the thicknesses  $t_{REN,Sa}$  and  $t_{REN,Sb}$  obtained from the shear strength check at sections a) and b) (see Fig 18 and [5.5.2]) given by the following, but need not be taken greater than  $0,75 t_{S12}$ .

- At section a)

$$t_{REN,Sa} = \frac{1000k_s P_{fr,a}}{d_a \sin \Phi \tau_a}$$

- At section b)

$$t_{REN,Sb} = \frac{1000k_s P_{fr,b}}{d_b \sin \Phi \tau_a}$$

where:

- $k_s$  : Shear force distribution factor, to be taken equal to 0,6
- $P_{fr,a}, P_{fr,b}$  : Pressure forces defined in [5.5.2], item a)
- $d_a$  : Bracket web depth, in mm, at section a) (see Fig 18)
- $d_b$  : Frame web depth, in mm, at section b) (see Fig 18). In case of separate brackets,  $d_b$  is to be taken as the minimum web depth deducing possible scallops
- $\Phi$  : Angle between frame web and shell plate
- $\tau_a$  : Allowable shear stress, in  $\text{N/mm}^2$ , defined in [5.5.3].

Figure 18 : Sections a) and b)

### 5.5.5 Bending strength check

Where the lower bracket length or depth does not meet the requirements in Pt D, Ch 4, Sec 3, [2.2.5], the actual section modulus, in  $\text{cm}^3$ , of the brackets and side frames at section a) and b) is to be not less than:

- At section a)

$$Z_a = \frac{1000 P_{fr,a} h}{m_a \sigma_a}$$

- At section b)

$$Z_b = \frac{1000 P_{fr,a} h}{m_b \sigma_a}$$

where:

- $P_{fr,a}$  : Pressure force defined in [5.5.2], item a)
- $h$  : Side frame span, in m, as defined in Fig 15
- $\sigma_a$  : Allowable normal stress, in  $\text{N/mm}^2$ , as defined in [5.5.3]
- $m_a, m_b$  : Bending moment coefficients, as defined in Tab 3.

The actual section modulus of the brackets and side frames is to be calculated about an axis parallel to the attached plate, based on the measured thicknesses. For precalculations, alternative thickness values may be used, provided they are not less than:

- $t_{REN}$  for the web thickness
- the minimum thicknesses allowed by the Society renewal criteria for flange and attached plating.

The attached plate breadth is equal to the frame spacing, measured along the shell at midspan of  $h$ .

If the actual section moduli at sections a) and b) are less than the values  $Z_a$  and  $Z_b$ , the frames and brackets are to be renewed or reinforced in order to obtain actual section moduli not less than  $1,2 Z_a$  and  $1,2 Z_b$ , respectively.

In such a case, renewal or reinforcements of the flange are to be extended over the lower part of side frames, as defined in Fig 15.

Table 3 : Bending moment coefficients  $m_a$  and  $m_b$

	$m_a$	$m_b$		
		$h_b \leq 0,08 h$	$h_b = 0,10 h$	$h_b \geq 0,125 h$
Empty holds of ships approved to operate in non homogeneous loading conditions	10	17	19	22
Other cases	12	20	22	26

Note 1: Non homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling ratio, evaluated for each hold, exceeds 1,20 corrected for different cargo densities.  
 Note 2: For intermediate values of the bracket length  $h_b$ , the coefficient  $m_b$  is obtained by linear interpolation between the Table values.

## 6 Cargo hatch cover securing arrangements for bulk carriers not built in accordance with edition 2003 of Pt B, Ch 9, Sec 7

### 6.1 Application

6.1.1 These retroactive rule requirements apply to ships which are assigned one of the following service notations:

- bulk carrier ESP
- bulk carrier BC-A ESP
- bulk carrier BC-B ESP
- bulk carrier BC-C ESP,

which were not built in accordance with Pt B, Ch 9, Sec 7, [1] to Pt B, Ch 9, Sec 7, [7] of edition February 2003 of the Rules as amended in accordance with November 2003 amendments or subsequent editions.

6.1.2 They are related to steel hatch cover securing devices and stoppers for cargo hold hatchways No.1 and No.2 which are wholly or partially within 0,25 L of the fore perpendicular, except pontoon type hatch cover.

### 6.2 Securing devices

6.2.1 The strength of securing devices is to comply with the following items:

- a) Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

- b) The net cross area of each securing device is to be not less than the value obtained, in cm<sup>2</sup>, from the following formula:

$$A = 1,4S_s \left( \frac{235}{R_{eH}} \right)^f$$

where:

- $S_s$  : Spacing, in m, of securing devices, to be taken not less than 2 m
- $R_{eH}$  : Minimum yield stress, in N/mm<sup>2</sup>, of the steel used for fabrication, defined in Pt B, Ch 4, Sec 1, [2] not to be taken greater than 70% of the minimum ultimate tensile strength  $R_m$  defined in Pt B, Ch 4, Sec 1, [2]
- f : Coefficient taken equal to:
- 0,75 for  $R_{eH} > 235$  N/mm<sup>2</sup>
  - 1,00 for  $R_{eH} \leq 235$  N/mm<sup>2</sup>

Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m<sup>2</sup> in area.

- c) Between cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by the securing devices.

For packing line pressures exceeding 5 N/mm, the net cross area A is to be increased in direct proportion. The packing line pressure is to be specified.

- d) The hatch cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices.

The moment of inertia I of edge elements is to be not less than the value obtained, in cm<sup>4</sup>, from the following formula:

$$I = 6 p_L S_s^4$$

where:

- $p_L$  : Packing line pressure, in N/mm, to be taken not less than 5 N/mm
- $S_s$  : Spacing, in m, of securing devices.

- e) Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

- f) Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

- g) Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

### 6.3 Stoppers

6.3.1 No.1 and No.2 hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m<sup>2</sup>.

6.3.2 No.2 hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m<sup>2</sup>.

**6.3.3** No.1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 230 kN/m<sup>2</sup>.

This pressure may be reduced to 175 kN/m<sup>2</sup> if a forecastle is fitted.

**6.3.4** The equivalent stress, in stoppers and their supporting structures and calculated in the throat of the stopper welds is not to exceed the allowable value of 0,8 R<sub>eH</sub>.

## **6.4 Materials and welding**

**6.4.1** Where stoppers or securing devices are fitted to comply with the requirements of this article, they are to be manufactured of materials, including welding electrodes complying with NR216 Materials and Welding.

## **7 Guidance on loading/unloading sequences**

### **7.1**

**7.1.1** The minimum acceptable number of typical sequences is:

- one homogeneous full load condition
- one part load condition where relevant, such as block loading or two port unloading
- one full load alternate hold condition, if the ship is approved for alternate hold loading.

**7.1.2** The shipowner/operator should select actual loading/ unloading sequences, where possible, which may be port specific or typical.

**7.1.3** The sequence may be prepared using the onboard loading instrument. The selected loading conditions should be built up step by step from commencement of cargo loading to reaching full deadweight capacity. Each time the loading equipment changes position to a new hold defines a step. Each step is to be documented and submitted to the Society. The printout from the loading instrument is generally acceptable. This allows the actual bending moments and shear forces to be verified and prevent the permissible values being exceeded. In addition, the local strength of each hold may need to be considered during the loading.

**7.1.4** For each loading condition a summary of all steps is to be included. This summary is to highlight the essential information for each step such as:

- how much cargo is filled in each hold during the different steps
- how much ballast is discharged from each ballast tank during the different steps
- the maximum still water bending moment and shear at the end of each step
- the ship's trim and draught at the end of each step.

**7.1.5** The approved typical loading/unloading sequences may be included in the approved loading manual or take the form of an addendum. A copy of the approved typical loading/unloading sequences is to be placed onboard the ship.

## **8 Water level detectors on single hold cargo ships other than bulk carriers**

### **8.1 Application**

**8.1.1** These retroactive rule requirements apply to ships indicated in Ch 6, Sec 4, [2.1.1].

### **8.2 Water level detectors**

**8.2.1** The water level detectors are to:

- give an audible and visual alarm at the navigation bridge when the water level above the inner bottom in the cargo hold reaches a height of not less than 0,3 m, and another when such level reaches not more than 15% of the mean depth of the cargo hold; and
- be fitted at the aft end of the hold, or above its lowest part where the inner bottom is not parallel to the designed waterline. Where webs or partial watertight bulkheads are fitted above the inner bottom, the Society may require the fitting of additional detectors.

**8.2.2** For ships not provided with double bottom in cargo hold, the water level detectors are to:

- give an audible and visual alarm at the navigation bridge when the water level above the bottom in the cargo hold reaches a height of not less than 0,3 m or the height of the floors at centerline, whichever is the highest, and another when such level reaches not more than 15% of the mean depth of the cargo hold; and
- be fitted at the aft end of the hold, or above its lowest part where the bottom is not parallel to the designed waterline. Where webs or partial watertight bulkheads are fitted above the bottom, the Society may require the fitting of additional detectors.

7	Watertight ventilators and trunks	70
	7.1 General	
8	Fuel oil tanks	70
	8.1 General	
	8.2 Fuel oil tank protection	
9	Tanks containing fuel for auxiliary vehicles	71
	9.1 General	
	9.2 Tank protection and segregation	
10	Tanks containing chemical treatment fluids for exhaust gas pollution prevention system	71
	10.1 Tank protection and segregation	
11	Tanks containing solvent for onboard carbon capture systems (ships assigned the additional service feature OCC)	71
	11.1 Tank protection and segregation	

## Section 3 Access Arrangement

1	General	72
	1.1	
2	Double bottom	72
	2.1 Inner bottom manholes	
	2.2 Floor and girder manholes	
3	Access arrangement to and within spaces in, and forward of, the cargo area	72
	3.1 General	
	3.2 Access to tanks	
	3.3 Access within tanks	
	3.4 Construction of ladders	
4	Shaft tunnels	74
	4.1 General	
5	Access to steering gear compartment	74
	5.1	

## Chapter 3 Stability

### Section 1 General

1	General	76
	1.1 Application	
	1.2 Application to ships having additional service feature SPxxx or SPxxx-capable	
	1.3 Application to ships having additional class notation STABLIFT	
	1.4 Alterations	

# Table of Content

## Chapter 5 Design Loads

### Section 1 Introduction

<b>1</b>	<b>General</b>	<b>186</b>
1.1	Definition	
1.2	Sign convention	

### Section 2 Dynamic Load Cases

<b>1</b>	<b>General</b>	<b>188</b>
1.1	Definition of EDW and dynamic load cases	
1.2	Application	
1.3	Description of dynamic load cases	
<b>2</b>	<b>Dynamic load cases for strength assessment</b>	<b>196</b>
2.1	Selection of EDW	
2.2	Load combination factors	
<b>3</b>	<b>Dynamic load cases for fatigue assessment</b>	<b>199</b>
3.1	Selection of EDW	
3.2	Load combination factors	

### Section 3 Ship Motions and Accelerations

<b>1</b>	<b>General</b>	<b>203</b>
1.1	Definitions	
<b>2</b>	<b>Ship motions and accelerations</b>	<b>204</b>
2.1	Ship motions	
2.2	Accelerations at the centre of gravity	
<b>3</b>	<b>Accelerations at any position</b>	<b>207</b>
3.1	General	
3.2	Accelerations for dynamic load cases	
3.3	Maximum accelerations for equipment	

### Section 4 Hull Girder Loads

<b>1</b>	<b>Application</b>	<b>209</b>
1.1	General	

# Table of Content

<b>2</b>	<b>Still water loads</b>	<b>209</b>
2.1	General	
2.2	Vertical still water bending moments	
2.3	Vertical still water shear forces	
<b>3</b>	<b>Wave loads</b>	<b>211</b>
3.1	Vertical wave bending moments	
3.2	Vertical wave shear force	
3.3	Horizontal wave bending moment	
3.4	Horizontal wave shear force	
3.5	Wave torsional moment	
3.6	Hull girder loads for dynamic load cases	

## Section 5 Environmental Loads

<b>1</b>	<b>Sea pressure</b>	<b>219</b>
1.1	Total pressure	
1.2	Hydrostatic pressure	
1.3	External dynamic pressure for strength assessment	
1.4	External dynamic pressure for fatigue assessment	
<b>2</b>	<b>Sea chests</b>	<b>234</b>
2.1	Design pressure	
<b>3</b>	<b>External pressure on exposed decks</b>	<b>234</b>
3.1	Application	
3.2	Green sea loads	
3.3	Load carried on exposed deck	
<b>4</b>	<b>External impact pressure</b>	<b>235</b>
4.1	Application	
4.2	Bottom and stern slamming impact pressures	
4.3	Bow flare impact pressure	
4.4	Berthing impact pressure	
<b>5</b>	<b>External pressure on front, side and aft bulkheads of superstructures and deckhouses</b>	<b>238</b>
5.1	Application	
5.2	Definitions	
5.3	Superstructures side bulkheads	
5.4	Deckhouses side and end bulkheads and superstructures end bulkheads	
<b>6</b>	<b>External pressures on hatch covers and coamings</b>	<b>240</b>
6.1	Application	
6.2	Green sea loads	
<b>7</b>	<b>External pressure on shell doors</b>	<b>242</b>
7.1	Bow doors	
7.2	Side and stern doors	
<b>8</b>	<b>External loads on containers</b>	<b>245</b>
8.1	Wind forces	

## Section 6 Internal Loads and cargo loads

<b>1</b>	<b>Pressures due to liquids</b>	<b>248</b>
1.1	Application	
1.2	Static liquid pressure in intact conditions	
1.3	Dynamic liquid pressure in intact conditions	
1.4	Static pressure in flooded conditions	

# Table of Content

	<b>2</b>	<b>Partly filled tanks intended for the carriage of liquid or ballast</b>	<b>250</b>
	2.1	Application	
	2.2	Pressure definition	
	2.3	Static pressure	
	2.4	Dynamic sloshing pressure	
	2.5	Dynamic impact pressure	
	2.6	Alternative methods	
	<b>3</b>	<b>Pressures and forces due to dry bulk cargo</b>	<b>252</b>
	3.1	Application

	7.1	Application	
	7.2	Forces due to wheeled cargo	
	<b>8</b>	<b>Loads due to containers</b>	<b>267</b>
	8.1	Forces applied to containers	
	8.2	Stacks of containers	
	<b>9</b>	<b>Loads on hatch covers</b>	<b>269</b>
	9.1	Application	
	9.2	Cargo loads	
	<b>10</b>	<b>Design pressure for tank testing</b>	<b>271</b>
	10.1	Definition	
<b>Section 7</b>		<b>Design Load Scenarios</b>	
	<b>1</b>	<b>General</b>	<b>273</b>
	1.1	Application	
	<b>2</b>	<b>Design load scenarios for strength assessment</b>	<b>274</b>
	2.1	Principal design load scenarios	
	2.2	Design load scenarios for impact and sloshing	
	<b>3</b>	<b>Design load scenario for fatigue assessment</b>	<b>275</b>
	3.1	Design load scenario	
<b>Section 8</b>		<b>Loading Conditions</b>	
	<b>1</b>	<b>Application</b>	<b>276</b>
	1.1	Loading conditions for strength assessment	
	1.2	Loading conditions for fatigue assessment	
	1.3	Specific loading conditions	
	<b>2</b>	<b>General</b>	<b>276</b>
	2.1	Definitions	

# Table of Content

3	Standard loading conditions for strength assessment	276
3.1	Seagoing conditions	
3.2	Harbour and sheltered water conditions	
4	Standard loading conditions for fatigue assessment	277
4.1	General	

## Chapter 6 Hull Girder Strength

### Section 1 Hull Girder Yield and Buckling Strength

1	Strength characteristics of hull girder transverse sections	279
1.1	General	
1.2	Hull girder transverse sections	
1.3	Structures contributing to the longitudinal strength	
1.4	Section modulus	
1.5	Moments of inertia	
1.6	Ships having large openings in the strength deck	
2	Hull girder stresses	284
2.1	Normal stress	
2.2	Shear stress	
3	Hull girder strength assessment	285
3.1	General	
3.2	Longitudinal extent	
3.3	Hull girder stiffness	
3.4	Hull girder minimum section modulus	
3.5	Yield strength assessment	
3.6	Extent of higher strength steel	
3.7	Buckling strength assessment	
4	Structural models for the calculation of normal warping stress and shear stress	287
4.1	Calculation methods	

### Section 2 Hull Girder Ultimate Strength

1	Application	288
1.1	General	
2	Checking criteria	288
2.1	General	
2.2	Hull girder ultimate bending loads	
2.3	Hull girder ultimate bending moment capacity	

### Appendix 1 Direct Calculation of Shear Flow

1	Calculation formula	290
1.1	General	
1.2	Determinate shear flow $qD$	
1.3	Indeterminate shear flow $qI$	
1.4	Computation of sectional properties	

### Appendix 2 Hull Girder Ultimate Bending Capacity

1	General	293
1.1	Application	
1.2	Methods	
1.3	General assumptions	

# Table of Content

2	Incremental-iterative method	293
2.1	Assumptions	
2.2	Procedure	
2.3	Load-end shortening curves	
3	Alternative methods	302
3.1	General	
3.2	Non-linear finite element analysis	

---

## Chapter 7 Hull Scantlings

### Section 1 General

1	Application	304
1.1	Application	
1.2	Acceptance criteria	

### Section 2 Load Application

1	Load combination	305
1.1	Hull girder	
1.2	Pressure combination	
2	Design load sets	305
2.1	Application of load components	

### Section 3 Minimum Thickness

1	General	310
1.1	Minimum thickness requirements	

### Section 4 Plating

1	Plating subject to lateral pressure	311
1.1	Yielding check	
1.2	Plating of corrugated bulkheads	
1.3	Buckling check	
2	Transverse vertically corrugated bulkheads separating dry bulk cargo holds in flooded condition	312
2.1	Application	
2.2	Net thickness of corrugation	
3	Strength check of plating supporting wheeled cargo	313
3.1	General	
3.2	Load model	
3.3	Plating	
4	Plating subject to impact loads	315
4.1	General	
5	Strength check of plating supporting steel coils on wooden dunnage	316
5.1	General	
5.2	Yielding check	

# Table of Content

<b>6</b>	<b>Special requirements</b>	<b>316</b>
	6.1 Minimum thickness of keel plating	
	6.2 Bilge plating	
	6.3 Inner bottom of cargo holds intended to carry dry cargo	
	6.4 Sheer strake	
	6.5 Deck stringer plating	
	6.6 Deck plating protected by wood sheathing or deck composition	
	6.7 Supporting structure in way of corrugated bulkheads	
	6.8 Aft peak bulkhead	
<b>Section 5</b>	<b>Stiffeners</b>	
<b>1</b>	<b>General</b>	<b>320</b>
	1.1 Yielding check of stiffeners subject to lateral pressure	
	1.2 Yielding check of stiffeners supporting wheeled cargo	
	1.3 Net section modulus and net shear sectional area of ordinary stiffeners subject to impact loads	
	1.4 Yielding check of stiffeners supporting steel coils on wooden dunnage	
	1.5 Deck stiffeners in way of launching appliances used for survival craft or rescue boat	
	1.6 Plate and stiffener of different materials	
	1.7 Beam analysis	
	1.8 Buckling check	
<b>Section 6</b>	<b>Primary Supporting Members and Pillars</b>	
<b>1</b>	<b>Application</b>	<b>325</b>
	1.1 Application	
<b>2</b>	<b>General</b>	<b>326</b>
	2.1 Scantling requirements	
	2.2 Wheeled loads	
	2.3 Primary members subject to impact loads	
	2.4 Deck primary members in way of launching appliances used for survival craft or rescue boat	
	2.5 Buckling check	
	2.6 Pillars subject to compressive axial load	
	2.7 Pillars subject to tensile axial load	
<b>3</b>	<b>Primary supporting members in holds intended to carry liquid cargo</b>	<b>330</b>
	3.1 Floors in double bottom	
	3.2 Girders in double bottom	
	3.3 Deck transverses	
	3.4 Side transverses	
	3.5 Vertical web frames on longitudinal bulkhead	
	3.6 Horizontal stringers on transverse bulkheads	
	3.7 Cross ties	
	3.8 Vertically corrugated bulkheads separating liquid cargo holds	
<b>4</b>	<b>Primary supporting members in holds intended to carry dry bulk cargo</b>	<b>346</b>
	4.1 Centre girders and side girders	
	4.2 Floors	
	4.3 Stringer of double side structure	
	4.4 Transverse web in double side structure	
	4.5 Primary supporting member in bilge hopper tanks and topside tanks	
	4.6 Transverse vertically corrugated bulkheads separating holds assigned as ballast holds and separating hopper wells on dredgers	
	4.7 Transverse vertically corrugated bulkheads in flooded conditions	
	4.8 Double bottom capacity in flooded conditions	
<b>5</b>	<b>Grillage structure</b>	<b>357</b>
	5.1 General	

# Table of Content

<b>Appendix 1</b>	<b>Analyses of Primary Supporting Members Subject to Wheeled Loads</b>	
1	<b>General</b>	<b>359</b>
1.1	Scope	
1.2	Application	
1.3	Information required	
1.4	Lashing of vehicles	
2	<b>Analysis criteria</b>	<b>359</b>
2.1	Finite element model analyses	
2.2	Beam model analyses	
3	<b>Primary supporting members structural modelling</b>	<b>360</b>
3.1	Model construction	
3.2	Model extension	
3.3	Boundary conditions of the three dimensional model	
4	<b>Load model</b>	<b>361</b>
4.1	General	
4.2	Local loads	
5	<b>Stress calculation</b>	<b>362</b>
5.1	Normal stress induced by hull girder loads	
5.2	Analyses based on beam models	
6	<b>Grillage analysis of primary supporting members of decks</b>	<b>362</b>
6.1	Application	
6.2	Structural model	
6.3	Boundary conditions	
6.4	Load model	
6.5	Stress calculation	

---

## Chapter 8 Direct Strength Analysis

### Section 1 Direct Strength Assessment

1	<b>General</b>	<b>365</b>
1.1	Application	
2	<b>Net scantling</b>	<b>365</b>
2.1	Net scantling application	
3	<b>Finite element types</b>	<b>365</b>
3.1	Finite element types to be used	
4	<b>Acceptance criteria</b>	<b>366</b>
4.1	Definition	
5	<b>Submission of results</b>	<b>366</b>
5.1	Detailed report	
6	<b>Computer programs</b>	<b>366</b>
6.1	Use of computer programs	

### Appendix 1 Cargo Hold Structural Strength Analysis

1	<b>Objective and scope</b>	<b>367</b>
1.1	General	
1.2	Cargo hold structural strength analysis procedure	

# Table of Content

<b>2</b>	<b>Structural model</b>	<b>368</b>
	2.1 Members to be modeled	
	2.2 Extent of model	
	2.3 Finite element types	
	2.4 Structural modeling	
	2.5 Boundary conditions	
<b>3</b>	<b>FE load combinations</b>	<b>378</b>
	3.1 Design load combinations	
<b>4</b>	<b>Load application</b>	<b>378</b>
	4.1 General	
	4.2 External and internal loads	
	4.3 Hull girder loads	
	4.4 Procedure to adjust hull girder shear forces and bending moments	
	4.5 Procedure to adjust hull girder torsional moments	
	4.6 Summary of hull girder load adjustments	
<b>5</b>	<b>Analysis criteria</b>	<b>393</b>
	5.1 General	
	5.2 Yield strength assessment	
	5.3 Buckling strength assessment	

## Appendix 2 Local Structural Strength Analysis

<b>1</b>	<b>Objective and scope</b>	<b>395</b>
	1.1 General	
	1.2 Structural details to be assessed by fine mesh analysis	
<b>2</b>	<b>Structural modeling</b>	<b>395</b>
	2.1 General	
	2.2 Extent of model	
	2.3 Mesh size	
	2.4 Elements	
	2.5 Transverse web frames	
	2.6 Transverse bulkhead stringers, buttress and adjacent web frame	
	2.7 Deck, double bottom longitudinal and adjoining transverse bulkhead vertical stiffeners	
	2.8 Corrugated bulkheads	
<b>3</b>	<b>FE load combinations</b>	<b>400</b>
	3.1 General	
	3.2 Application of loads and boundary conditions	
<b>4</b>	<b>Analysis criteria</b>	<b>400</b>
	4.1 Yield strength assessment	

## Appendix 3 Full Length Structural Strength Analysis

<b>1</b>	<b>Objective and scope</b>	<b>402</b>
	1.1 General	
	1.2 Full length structural strength analysis procedure	
<b>2</b>	<b>Structural model</b>	<b>402</b>
	2.1 Model construction	
	2.2 Extent of model	
	2.3 Finite element types	
	2.4 Structural modeling	
	2.5 Boundary conditions of the model

## Chapter 9 Buckling

### Section 1 Buckling

1	General	408
1.1	Application	
1.2	Allowable buckling utilisation factor	
2	Slenderness requirements	408
2.1	Application	
3	Prescriptive buckling requirements	409
3.1	Application	
3.2	Design load sets	
3.3	Hull girder stress	

---

## Chapter 10 Fatigue

### Section 1 Fatigue

1	General	411
1.1	Application	
1.2	Reference	
1.3	Fatigue due to loading and unloading	
2	Loading conditions	411
2.1	Design loading conditions for fatigue assessment	
3	Corrosion model	412
3.1	General	
4	Fatigue assessment based on a deterministic approach	412
4.1	Longitudinal stiffener connections	
4.2	Other structural details	
5	Fatigue assessment based on spectral fatigue analysis	413
5.1	General	
6	Acceptance criteria	414
6.1	Fatigue life and acceptance criteria	

## Chapter 11 Other Structures

### Section 1 Fore Part

<b>1</b>	<b>General</b>	<b>416</b>
1.1	Application	
<b>2</b>	<b>Structural arrangement</b>	<b>416</b>
2.1	Bottom Structure	
2.2	Centreline wash bulkheads	
2.3	Side shell structure	
2.4	Tripping brackets	
2.5	Decks	
2.6	Platforms	
2.7	Bulbous bow	
2.8	Stems	
2.9	Thruster tunnel	
<b>3</b>	<b>Structures subject to impact loads</b>	<b>421</b>
3.1	General	
3.2	Bottom slamming	
3.3	Bow impact	

### Section 2 Machinery Space

<b>1</b>	<b>General</b>	<b>425</b>
1.1	Application	
<b>2</b>	<b>Machinery space arrangement</b>	<b>425</b>
2.1	Structural arrangement	
2.2	Double bottom	
2.3	Single bottom	
<b>3</b>	<b>Machinery foundations</b>	<b>428</b>
3.1	General	
3.2	Scantlings	
3.3	Foundations for internal combustion engines and thrust bearings	
3.4	Auxiliary machinery foundations	

### Section 3 Aft Part

<b>1</b>	<b>General</b>	<b>430</b>
1.1	Application	
<b>2</b>	<b>Aft peak</b>	<b>430</b>
2.1	Structural arrangement	
2.2	Stiffening of floors and girders	
<b>3</b>	<b>Connection of hull structures with the rudder horn</b>	<b>431</b>
3.1	Connection of after peak structures with the rudder horn	
3.2	Structural arrangement above the after peak	
<b>4</b>	<b>Stern frames</b>	<b>432</b>
4.1	General	
4.2	Propeller posts	
4.3	Connections	
4.4	Rudder gudgeons	
4.5	Sterntubes	
<b>5</b>	<b>Shell structure</b>	<b>433</b>
5.1	Shell plating	
5.2	Ordinary stiffeners	

# Table of Content

	6	Structure subject to stern impact loads	434
	6.1	General	
<b>Section 4</b>		<b>Tanks Subject to Sloshing</b>	
	1	Application	436
	1.1	General	
	1.2	Liquefied gas carriers	
	1.3	Sloshing loads	
	1.4	Impact loads	
	1.5	Evaluation of the risk of resonance	
	2	Scantling of elements subject to sloshing loads	439

### CHAPTER 1

### GENERAL

---

Section 1	Application
Section 2	Rules Principles
Section 3	Symbols and Definitions
Section 4	Documentation to be Submitted
Section 5	Loading Manual and Loading Instruments
Appendix 1	Equivalences between Current Revision and July 2021 Edition of the Rules for the Classification of Steel Ships

# Section 1 Application

## 1 Scope of application

### 1.1 General

**1.1.1** These Rules contain the requirements for the determination of the minimum hull scantlings, applicable to all types of seagoing monohull displacement ships of conventional shape, speed and proportions, made in welded steel construction.

Other types of ships will be considered by the Society on a case by case basis.

These requirements are to be integrated with those specified in Part D and Part E, for any individual ship type, and in Part F, as applicable, depending on the additional class notations assigned to the ships.

**1.1.2** Ships covered by NR600 "Hull Structure and Arrangement for the Classification of Cargo Ships less than 65 m and Non Cargo Ships less than 90 m" are not covered in these Rules.

Note 1: NR600 is applicable for:

- cargo ships with length less than 65 m, and
- non cargo ships with length less than 90 m.

The wording "cargo ships" and "non-cargo ships" used in NR600 means:

- Cargo ships: ships liable to carry cargoes and having a deadweight greater than 30% of the total displacement. As a general rule, these ships are fitted with cargo holds, tanks and lateral ballast tanks (i.e bulk or ore carriers, oil or chemical tanker, container ship, general cargo ship) and the value of the block coefficient is greater than 0,75
- Non-cargo ships: type of ships other than cargo ships defined here above or ships having a deadweight greater than 30% of the total displacement and not fitted with lateral ballast tanks used in non loaded navigation condition.

Note 2: NR600 is not applicable for liquefied gas carriers and any cargo ships with alternate light and heavy cargo loading conditions.

**1.1.3** These Rules apply to welded hull structures made of steel having characteristics complying with requirements in Ch 4, Sec 1. These Rules applies also to welded steel ships in which parts of the hull, such as superstructures or small hatch covers, are built in material other than steel, complying with requirements in Ch 4, Sec 1.

Ships whose hull materials are different than those given in the first paragraph are to be individually considered by the Society, on the basis of the principles and criteria adopted in these Rules.

**1.1.4** The strength of ships constructed and maintained according to the Rules is sufficient for the draught corresponding to the assigned freeboard. The scantling draught considered when applying the Rules is to be not less than that corresponding to the assigned freeboard.

**1.1.5** Where scantlings are obtained from direct calculation procedures which are different from those specified in Part B, Chapter 7, adequate supporting documentation is to be submitted to the Society, as detailed in Ch 1, Sec 4.

### 1.2 Limits of application to lifting appliances

**1.2.1** The fixed parts of lifting appliances, considered as an integral part of the hull, are the structures permanently connected by welding to the ship's hull (for instance crane pedestals, masts, king posts, derrick heel seatings, etc., excluding cranes, derrick booms, ropes, rigging accessories, and, generally, any dismantable parts). The shrouds of masts embedded in the ship's structure are considered as fixed parts.

**1.2.2** The fixed parts of lifting appliances and their connections to the ship's structure are covered by the Rules, even when the certification (especially the issuance of the Cargo Gear Register) of lifting appliances is not required.

**1.2.3** The foundations of lifting appliances intended to be used at sea are to comply with the requirements of Part E, Chapter 8.

## 2 Rule application

### 2.1 Ship parts

#### 2.1.1 General

For the purpose of application of these Rules, the ship is considered as divided into the following three parts:

- fore part
- central part
- aft part.

**2.1.2 Fore part**

The fore part is the part of the ship located forward of the collision bulkhead, i.e.:

- the fore peak structures
- the stem.

**2.1.3 Central part**

The central part includes the structures located between the collision bulkhead (included) and the after peak bulkhead.

Where the flat bottom forward area or the bow flare area extend aft of the collision bulkhead, they are considered as belonging to the fore part.

**2.1.4 Aft part**

The aft part includes the structures located aft of the aft peak bulkhead.

**2.2 Rules applicable to various ship parts**

**2.2.1** The various Chapters and Sections of Part B are to be applied for the scantling and arrangement of ship parts according to Tab 1.

**Table 1 : Part B Chapters and Sections applicable for the scantling of ship parts**

Applicable Chapters and Sections		
All ship parts	Specific ship parts	
Part B, Chapter 1 Part B, Chapter 2 Part B, Chapter 3 Part B, Chapter 4 Part B, Chapter 5 Part B, Chapter 6		
Part B, Chapter 7	Central part	Part B, Chapter 7
Part B, Chapter 8 Part B, Chapter 9 Part B, Chapter 10		
Part B, Chapter 11 (1) (2)	Fore part	Ch 11, Sec 1
	Aft part	Ch 11, Sec 3
Part B, Chapter 13		
(1) See also [2.3].		
(2) excluding Ch 11, Sec 1 and Ch 11, Sec 3		

**2.3 Rules applicable to other ship items**

**2.3.1** The various Chapters and Sections of Part B are to be applied for the scantling and arrangement of other ship items according to Tab 2.

**Table 2 : Part B Chapters and Sections applicable for the scantling of other items**

Item	Applicable Chapters and Sections	Item	Applicable Chapters and Sections
Machinery space	Ch 11, Sec 2	Rudders	Ch 12, Sec 1
Tanks subject to sloshing	Ch 11, Sec 4	Other hull outfitting	Ch 12, Sec 2
Superstructures and deckhouses	Ch 11, Sec 5		Ch 12, Sec 3
Bow doors and inner doors	Ch 11, Sec 6		Ch 12, Sec 4
Side shell doors and stern doors	Ch 11, Sec 7		
Watertight and weathertight doors	Ch 11, Sec 8		
Large hatch covers	Ch 11, Sec 9		
Small hatches	Ch 11, Sec 10		
Movable decks and inner ramp External ramps	Ch 11, Sec 11		
Arrangement of hull and superstructures openings	Ch 11, Sec 12		
Helicopter decks	Ch 11, Sec 13		

## Section 2 Rules Principles

### 1 Design basis

#### 1.1 General

**1.1.1** Ships are to be designed to withstand, in intact condition, the environmental conditions as defined in [1.4] anticipated during the design life, for the appropriate loading conditions. Structural strength is to be determined against buckling and yielding. Ultimate strength calculations must include ultimate hull girder capacity and ultimate strength of plates and stiffeners.

**1.1.2** Ships are to be designed to have sufficient reserve strength to withstand loads in damaged conditions, e.g. flooded scenarios.

#### 1.1.3 Finite element analysis

Scantlings of structural members within the cargo hold region of ships having a length  $L$  of 150 m or above are to be assessed according to the requirements specified in Part B, Chapter 8.

#### 1.1.4 Fatigue life

Ships having a length  $L$  of 150 m or above are to be assessed according to the design fatigue life for structural details specified in Part B, Chapter 10.

#### 1.2 Hull form limit

**1.2.1** Loads applying to the ship hull, as described in these Rules, are based on hull forms within the following limits:

- $L < 500$  m
- $C_B > 0,6$
- $L/B > 5$
- $B/D < 2,5$

with the Rule length  $L$ , the block coefficient  $C_B$ , the moulded breadth  $B$  and the moulded depth  $D$  defined in Ch 1, Sec 3. Specific consideration will be given by the Society to ships with different hull forms.

#### 1.3 Design life

**1.3.1** Rule loads and scantling criteria are based on a target design life of 25 years. The design life is the period during which the ship is assumed to be exposed to operating conditions.

#### 1.4 Environmental conditions

##### 1.4.1 Wave environment

Unless otherwise specified, the rule requirements are based on north atlantic wave environment for the strength and fatigue assessments.

##### 1.4.2 Wind and current

The effects of current are not considered with regard to the strength of the structure.

The effects of wind are only considered for defining the minimum external pressure acting on the hull, superstructures and deckhouses.

##### 1.4.3 Design temperatures

The structural assessment of hull strength members is assumed to be valid for the following design temperatures:

- lowest mean daily average temperature in air:  $-10^{\circ}\text{C}$
- lowest mean daily average temperature in seawater:  $0^{\circ}\text{C}$ .

Ships intended to operate in areas with lower mean daily average temperature, e.g. regular service during winter seasons to Arctic or Antarctic waters, are subject to specific requirements.

In the above, the following definitions apply:

daily average : Average during one day and one night

mean : Statistical mean over an observation period (at least 20 years)

lowest : The lowest value during one year.

For seasonally restricted service, the lowest value within the period of operation applies.

## **1.5 Operating conditions**

**1.5.1** The Rules specify the minimum loading conditions that are to be assessed for compliance.

Specification of loading conditions other than those required by the Rules is the responsibility of the Owner. These other loading conditions are to be documented and assessed for compliance.

## **1.6 Operating draughts**

**1.6.1** The design operating draughts are to be specified by the builder/designer, subject to acceptance by the Owner, and are to be used to derive the appropriate structural scantlings.

All operational loading conditions in the loading manual are to comply with the specified design operating draughts. The following design operating draughts are, as a minimum, to be considered:

- scantling draught for the assessment of structure
- minimum ballast draught at midship for the assessment of structure
- minimum forward draught,  $T_F$ , for the assessment of bottom structure forward subjected to slamming loads, as defined in Ch 5, Sec 5, [4.2.1].

## **1.7 Maximum service speed**

**1.7.1** The maximum service speed is to be specified. Although the hull structure assessment accounts for the service speed, this does not relieve the responsibilities of the Owner and personnel to properly handle the ship.

## **1.8 Owner's extras**

**1.8.1** The Owner's specification above the general classification or statutory requirements may affect the structural design. Owner's extras may include requirements for:

- vibration analysis
- maximum percentage of high strength steel
- additional scantlings above those required by the Rules
- additional design margin on the loads specified by the Rules, etc
- improved fatigue resistance, in the form of a specified increase in design fatigue life or equivalent.

Owner's extras are not specified in these Rules. Owner's extras, if any, that may affect the structural design are to be clearly specified in the design documentation.

# **2 Design principles**

## **2.1 Overall principles**

**2.1.1** These Rules are based on the following overall principles:

- the safety of the structure can be assessed by addressing the potential structural failure mode(s) when the ship is subject to operational loads and environmental loads/conditions
- the structural requirements are based on consistent design load sets which cover the appropriate operating modes of ships complying with Ch 1, Sec 1, [1].

**2.1.2** The ship structure is so designed that:

- it has a degree of redundancy. The ship structure should work in a hierarchical manner and, in principle, failure of structural elements lower down in the hierarchy does not result in immediate consequential failure of elements higher up in the hierarchy
- it has sufficient reserve strength to withstand the wave and internal loads in damaged conditions that are reasonably foreseeable, e.g. flooding scenarios
- the incidence of in-service cracking is minimised, particularly in locations which affect the structural integrity or containment integrity, affect the performance of structural or other systems, or are difficult to inspect and repair
- it has adequate structural redundancy to survive in the event that the structure is accidentally damaged by a minor impact leading to flooding of any compartment.

## **2.2 Loads**

### **2.2.1 Design load scenarios**

The structural assessment is based on the design load scenarios encountered by the ship, as defined in Ch 5, Sec 7 and reminded below:

- N : Seagoing conditions with extrem sea loads  
H : Harbour and sheltered water conditions

T	: Tank testing operations
I	: Application of impact loads such as bottom slamming and bow impact encountered during seagoing operations
SL	: Application of sloshing loads encountered during seagoing operations
F	: Fatigue design load scenario
A	: Accidental scenarios with loads not occurring during normal operations
BWE	: Ballast water exchange scenario.

### 2.2.2 Load categories

The design load scenarios given in [2.2.1] may be associated to one of the following load categories:

- S when the associated load components result only from static effects
- S+D when the associated load components result from both static and dynamic effects.

## 2.3 Structural capacity assessment

### 2.3.1 General

The basic principle in structural design is to apply the defined design loads, identify plausible failure modes and use appropriate capacity models to obtain the required structural scantlings.

### 2.3.2 Capacity models for strength assessment

The capacity models for strength assessment are able to analyse the failure mode with regard to the required degree of accuracy. The capacity models are either in a prescriptive format or require the use of more advanced calculations such as finite element analysis methods.

The formulae used to determine stress, deformations and capacity are deemed appropriate for the selected capacity assessment method and the type and magnitude of the design load set.

### 2.3.3 Capacity models for fatigue assessment

The capacity models for fatigue assessment:

- provide rule requirements to assess structural details against fatigue failure
- are based on a linear cumulative damage summation (Palmgren-Miner rule) in combination with a design S-N curve, a reference stress range and an assumed long-term stress distribution curve, and
- are either in a prescriptive format or require the use of more advanced calculations, such as finite element analysis methods. These methods account for the combined effects of global and local dynamic loads.

### 2.3.4 Net scantling approach

The objective of the net scantling approach is to:

- provide a relationship between the thickness used for strength calculations during the newbuilding stage and the minimum thickness accepted during the operational phase
- enable the status of the structure with respect to corrosion to be clearly ascertained throughout the life of the ship.

The net scantling approach distinguishes between local corrosion and global corrosion:

- local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener
- global corrosion is defined as the overall average corrosion of larger areas, such as primary supporting members and the hull girder.

Both the local corrosion and the global corrosion are used as a basis for the newbuilding review and are to be assessed during operation of the ship.

No credit is given in the assessment of structural capability for the presence of coatings or similar corrosion protection systems.

The application of the net thickness approach to assess the structural capacity is specified in Ch 4, Sec 2.

## 3 Rule design methods

### 3.1 General

#### 3.1.1 Design methods

Scantling requirements are specified to cover the relevant failure modes, as necessary, for various structural parts.

The criteria for the assessment of scantlings are based on one of the following design methods:

- Working stress design (WSD) method, also known as the permissible or allowable stress method
- Partial safety factor (PSF) method, also known as load and resistance factor design (LRFD).

For both WSD and PSF, two design assessment conditions are given, as well as the corresponding acceptance criteria. These conditions are associated with the probability level of the combined loads, A and B.

## a) Composition of the WSD method

- for condition A:

$$W_{\text{stat}} \leq \eta_1 R$$

- for condition B:

$$W_{\text{stat}} + W_{\text{dyn}} \leq \eta_2 R$$

where:

$W_{\text{stat}}$  : Simultaneously occurring static loads (or load effects in terms of stresses)

$W_{\text{dyn}}$  : Simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components

$R$  : Characteristic structural capacity (e.g. specified minimum yield stress or buckling capacity)

$\eta_i$  : Permissible utilisation factor (resistance factor). The utilisation factor includes consideration of uncertainties in loads, structural capacity and the consequence of failure.

## b) Composition of the PSF method

- for condition A:

$$\gamma_{\text{stat-1}} W_{\text{stat}} + \gamma_{\text{dyn-1}} W_{\text{dyn}} \leq \frac{R}{\gamma_R}$$

- for condition B:

$$\gamma_{\text{stat-2}} W_{\text{stat}} + \gamma_{\text{dyn-2}} W_{\text{dyn}} \leq \frac{R}{\gamma_R}$$

where:

$\gamma_{\text{stat-i}}$  : Partial safety factor that accounts for the uncertainties related to static loads in condition A or B

$\gamma_{\text{dyn-i}}$  : Partial safety factor that accounts for the uncertainties related to dynamic loads in condition A or B

$\gamma_R$  : Partial safety factor that accounts for the uncertainties related to structural capacity.

The acceptance criteria for both the WSD method and the PSF method are calibrated for the various requirements such that consistent and acceptable safety levels for all combinations of static and dynamic load effects are derived.

**3.2 Minimum requirements**

**3.2.1** The minimum requirements specify the minimum scantling requirements which are to be applied irrespective of all other requirements, hence thickness below the minimum is not allowed.

The minimum requirements are usually in one of the following forms:

- minimum thickness, which is independent of the specified minimum yield stress
- minimum stiffness and proportion, which are based on buckling failure modes.

**3.3 Load-capacity based requirements****3.3.1 General**

In general, the working stress design (WSD) method is applied in the requirements, except for the hull girder ultimate strength criteria, where the partial safety factor (PSF) method is applied for its highly critical failure mode, in order to better account for uncertainties related to static loads, dynamic loads and capacity formulations.

The identified load scenarios are addressed by the Rules in terms of design loads, design format and acceptance criteria set.

Load-capacity based prescriptive requirements provide scantling requirements for all plating, local support members, most primary supporting members and the hull girder and cover all structural elements including deckhouses and foundations for deck equipment.

In general, these requirements explicitly control one particular failure mode and hence several requirements may be applied to assess one particular structural member.

**3.3.2 Design loads for strength assessment**

The structural assessment of the compartment boundaries, e.g. the bulkheads, is based on the loading condition deemed relevant for the type of ship and the operation the ship is intended for.

To provide consistency of approach, standardised rule values for parameters, such as  $GM$  and  $C_B$ , are applied to calculate the rule load values.

The design load scenarios for structural verification combine the applicable and simultaneously acting local and global load components. The relevant design load scenarios are given in Ch 5, Sec 7.

The simultaneously occurring dynamic loads are obtained by applying a dynamic load combination factor to the dynamic load values given in Part B, Chapter 5. The dynamic load combination factors for each dynamic load case are given in Ch 5, Sec 2.

Design load conditions for the hull girder ultimate strength are given in Ch 6, Sec 2.

### **3.3.3 Design loads for fatigue assessment**

For the fatigue requirements given in Part B, Chapter 10, the load assessment is based on the expected load history and an average approach is applied. The expected load history for the design life is characterised by the  $10^{-2}$  probability level of the dynamic load value, the load history for each structural member is represented by Weibull probability distributions of the corresponding stresses.

The considered wave induced loads include:

- hull girder loads (i.e. vertical and horizontal bending moments)
- dynamic wave pressures
- dynamic pressure from cargo, if any.

The load values are based on rule parameters corresponding to the loading conditions, e.g.  $G_M$ ,  $C_B$  and the applicable draughts amidships.

The simultaneously occurring dynamic loads are accounted for, combining the stresses due to the various dynamic load components. The stress combination procedure is given in Part B, Chapter 10.

### **3.3.4 Structural response analysis**

The following approaches are used for the determination of the structural response to the applied design load combinations:

- a) beam theory is used for prescriptive requirements
- b) finite element analysis is used for:
  - standard mesh for cargo hold model
  - fine mesh for local models
  - very fine mesh for fatigue assessment.

## **3.4 Acceptance criteria**

### **3.4.1 General**

The acceptance criteria are categorised into four sets. The specific acceptance criteria sets applied in the rule requirements depend on the probability level of the characteristic combined load.

- a) The acceptance criteria set AC-1 is typically applied for the static design load scenarios (S) and for the sloshing design loads. The allowable stress for such loads is lower than for an extreme load to take into account effects of:
  - repeated yield
  - allowance for some dynamics
  - margins for some selected limited operational mistakes.
- b) the acceptance criteria set AC-2 is typically applied for the static + dynamic design load scenarios (S+D), where the considered loads are extreme loads with a low probability of occurrence.
- c) the acceptance criteria set AC-3 is typically applied for exceptional static conditions load scenarios (A: S and T: S), such as flooding or tank testing loads.
- d) the acceptance criteria set AC-4 is typically applied for impact design load scenarios (I), such as bottom slamming and bow impact loads.

### **3.4.2 Criteria**

A general overview of the acceptance criteria is provided in Tab 1 and Tab 2 for the different design load scenarios covered by these Rules for the yield and buckling failure modes:

- for the yield criteria, the permissible stress is proportional to the specified minimum yield stress of the material
- for the buckling failure mode, the acceptance criteria are based on the control of stiffness and proportions as well as on the buckling utilisation factor.

## **3.5 Design verification**

### **3.5.1 Design verification - Hull girder ultimate strength**

The requirements for the ultimate strength of the hull girder are based on a partial safety factor (PSF) method. A safety factor is assigned to each of the basic variables, the still water bending moment, the wave bending moment and the ultimate capacity. The safety factors are determined using a structural reliability assessment approach, the long-term load history distribution of the wave bending moment is derived using ship motion analysis techniques suitable for determining extreme wave bending moments.

The purpose of the hull girder ultimate strength verification is to demonstrate that one of the most critical failure modes of the ship is controlled.

### **3.5.2 Design verification - Finite element analysis**

The finite element analysis is used to verify the scantlings given by the load-capacity based prescriptive requirements to better consider the complex interactions between the ship's structural components, complex local structural geometry, change in thicknesses and member section properties as well as the complex load regime with sufficient accuracy.

A linear elastic three dimensional finite element analysis of the cargo region, if any, or of the full length model is carried out to assess and verify the structural response of the actual hull girder and primary supporting members and to provide the scantling requirements for the primary supporting members. The purpose of the finite element analysis is to verify that the stresses and buckling capability of the primary supporting members are within acceptable limits for the applied design loads.

**3.5.3 Design verification - Fatigue assessment**

The fatigue assessment is required to verify that the fatigue life of critical structural details is adequate. A simplified fatigue requirement is applied to details such as end connections of longitudinal stiffeners using stress concentration factors (SCF) to account the actual detail geometry. A fatigue assessment procedure using finite element analysis for determining the actual hot spot stress of the geometric detail is applied to selected details. In both cases, the fatigue assessment method is based on the Palmgren-Miner linear damage model.

**3.5.4 Relationship between prescriptive scantling requirements and finite element analysis**

The scantlings defined by the prescriptive requirements are not to be reduced by any form of alternative calculations such as finite element analysis, unless explicitly stated.

**Table 1 : Acceptance criteria - Prescriptive requirements**

Acceptance criteria	Plate panels and local supporting members (1)		Primary supporting members (1)		Hull girder members	
	Yield	Buckling	Yield	Buckling	Yield	Buckling
AC-1 AC-2 AC-3	Permissible stress: Ch 7, Sec 4 Ch 7, Sec 5	Control of stiffness and proportions: Ch 9, Sec 1	Permissible stress: Ch 7, Sec 6	Control of stiffness and proportions: Ch 9, Sec 1	Permissible stress: Ch 6, Sec 1	Allowable buckling utilisation factor: Ch 9, Sec 1
AC-4	Plastic criteria: Ch 11, Sec 1, [3] Ch 11, Sec 3, [6] Ch 11, Sec 4, [3]	Control of stiffness and proportions: Ch 9, Sec 1	Plastic criteria: Ch 11, Sec 1, [3] Ch 11, Sec 3, [6] Ch 11, Sec 4, [3]	Control of stiffness and proportions: Ch 9, Sec 1	N/A	N/A

(1) Refer to Part B, Chapter 11 for other structures and to Ch 11, Sec 5 for superstructures, deckhouses and hull outfitting.

**Table 2 : Acceptance criteria - Finite Element Analysis**

Acceptance criteria	Cargo hold analysis		Fine mesh analysis
	Yield	Buckling	Yield
AC-1 AC-2 AC-3	Permissible stress: refer to Ch 8, App 1, [5]	Allowable buckling utilisation factor: refer to Ch 9, Sec 1	Permissible stress: refer to Ch 8, App 2, [4] Screening criteria: refer to Ch 8, App 2, [1.2.3]

# Section 3 Symbols and Definitions

## 1 Symbols and units

### 1.1

#### 1.1.1 Ship's dimensions and main data

Unless otherwise specified, symbols regarding ship's main data and their units used in these Rules are those defined in Tab 1.

#### 1.1.2 Materials

Unless otherwise specified, symbols regarding materials and their units used in these Rules are those defined in Tab 2.

**Table 1 : Ship's dimensions and main data**

Symbol	Meaning				Unit	Reference
B	Moulded breadth of the ship				m	[2.1.4]
$C_B$	Block coefficient at draught $T_{SC}$				–	[2.1.9]
$C_{B-BAL}$	Block coefficient at draught $T_{BAL}$				–	[2.1.9]
$C_W$	Waterplane coefficient at draught $T_{SC}$				–	[2.1.10]
$C_{W-BAL}$	Waterplane coefficient at draught $T_{BAL}$				–	[2.1.10]
D	Moulded depth of the ship				m	[2.1.5]
$\Delta$	Moulded displacement at draught $T_{SC}$				t	[2.1.7]
L	Rule length				m	[2.1.1]
	$L_0 = \min(L; 120)$	$L_1 = \min(L; 200)$	$L_2 = \min(L; 250)$	$L_3 = \min(L; 300)$		
$L_{LL}$	Load line length				m	[2.1.2]
$L_S$	Subdivision length				m	[2.1.3]
T	Moulded draught				m	[2.1.6]
$T_{BAL}$	Minimum draught amidships among ballast conditions				m	[2.1.6]
$T_{BAL-H}$	Minimum draught amidships among heavy ballast conditions				m	[2.1.6]
$T_{LC}$	Draught amidships at the considered loading condition				m	[2.1.6]
$T_{SC}$	Scantling draught				m	[2.1.6]
V	Maximum service speed				knots	[2.1.8]
x, y, z	Coordinates of the calculation point with respect to the reference coordinate system				m	[2.6]

**Table 2 : Materials**

Symbol	Meaning	Unit	Reference
E	Young's modulus	N/mm <sup>2</sup>	Ch 4, Sec 1, [2]
G	Shear modulus: $G = \frac{E}{2(1 + \nu)}$	N/mm <sup>2</sup>	–
k	Material factor	–	Ch 4, Sec 1, [2]
$\nu$	Poisson's ratio	–	Ch 4, Sec 1, [2]
$R_{eH}$	Specified minimum yield stress	N/mm <sup>2</sup>	Ch 4, Sec 1, [2]
$R_m$	Specified minimum tensile strength	N/mm <sup>2</sup>	Ch 4, Sec 1, [2]
$R_Y$	Nominal yield stress, taken equal to 235/k	N/mm <sup>2</sup>	–
$\tau_{eH}$	Specified shear yield stress: $\tau_{eH} = \frac{R_{eH}}{\sqrt{3}}$	N/mm <sup>2</sup>	–

**1.1.3 Loads**

Unless otherwise specified, symbols regarding loads and their units used in these Rules are those defined in Tab 3.

**1.1.4 Scantlings**

Unless otherwise specified, symbols regarding scantlings and their units used in these Rules are those defined in Tab 4.

**1.1.5 Gravity acceleration**

The gravity acceleration  $g$  is taken equal to  $9,81 \text{ m/s}^2$ .

**1.1.6 Density of seawater**

The density of seawater  $\rho$  is taken equal to  $1,025 \text{ t/m}^3$ .

**Table 3 : Loads**

Symbol	Meaning	Unit	Reference
$T_{\theta}$	Roll period	s	Ch 5, Sec 3, [2.1.1]
$\theta$	Roll angle	deg	Ch 5, Sec 3, [2.1.1]
$T_{\varphi}$	Pitch period	s	Ch 5, Sec 3, [2.1.2]
$\varphi$	Pitch angle	deg	Ch 5, Sec 3, [2.1.2]
$a_x$	Longitudinal acceleration	$\text{m/s}^2$	Ch 5, Sec 3, [3]
$a_y$	Transverse acceleration	$\text{m/s}^2$	Ch 5, Sec 3, [3]
$a_z$	Vertical acceleration	$\text{m/s}^2$	Ch 5, Sec 3, [3]
$k_r$	Roll radius of gyration	m	Ch 5, Sec 3, Tab 4
GM	Metacentric height	m	Ch 5, Sec 3, Tab 4
S	Static load scenario	–	–
S+D	Dynamic load scenario	–	–
$P_{ex}$	Total sea pressure	$\text{kN/m}^2$	Ch 5, Sec 5, [1]
$P_{in}$	Total internal pressure due to liquid	$\text{kN/m}^2$	Ch 5, Sec 6, [1]
$P_s$	Static sea pressure	$\text{kN/m}^2$	Ch 5, Sec 5, [1.2]
$P_{ls}$	Static tank pressure	$\text{kN/m}^2$	Ch 5, Sec 6, [1.2]
$P_w$	Dynamic wave pressure	$\text{kN/m}^2$	Ch 5, Sec 5, [1.3] and Ch 5, Sec 5, [1.4]
$P_{ld}$	Dynamic tank pressure	$\text{kN/m}^2$	Ch 5, Sec 6, [1.3]
$P_d$	Green sea deck pressure	$\text{kN/m}^2$	Ch 5, Sec 5, [3.2]
$P_{sl}$	Sloshing pressure	$\text{kN/m}^2$	Ch 5, Sec 6, [2.2.1]
$P_{dl}$	Total pressure due to uniform cargo	$\text{kN/m}^2$	Ch 5, Sec 6, [6.1]
$P_{SLI}$	Bottom and stern slamming pressure	$\text{kN/m}^2$	Ch 5, Sec 5, [4.2]
$P_{FI}$	Bow impact pressure	$\text{kN/m}^2$	Ch 5, Sec 5, [4.3]
$P_{fs}$	Static pressure in flooded conditions	$\text{kN/m}^2$	Ch 5, Sec 6, [1.4.1]
$P_{ST}$	Tank testing pressure	$\text{kN/m}^2$	Ch 5, Sec 6, [10.1.1]
$F_{u-s}$	Force due to unit cargo in static (S) design load scenario	kN	Ch 5, Sec 6, [6.2.1]
$F_{u-d}$	Force due to unit cargo in static plus dynamic (S+D) design load scenario	kN	Ch 5, Sec 6, [6.2.1]
$M_{sw}$	Vertical still water bending moment	$\text{kN}\cdot\text{m}$	Ch 5, Sec 4, [2.1.1]
$Q_{sw}$	Vertical still water shear force	kN	Ch 5, Sec 4, [2.3.1]
$M_{wv}$	Vertical wave bending moment	$\text{kN}\cdot\text{m}$	Ch 5, Sec 4, [3.1]
$Q_{wv}$	Vertical wave shear force	kN	Ch 5, Sec 4, [3.2]
$M_{wt}$	Torsional wave moment	$\text{kN}\cdot\text{m}$	Ch 5, Sec 4, [3.5]
$M_{wh}$	Horizontal wave bending moment	$\text{kN}\cdot\text{m}$	Ch 5, Sec 4, [3.3]
$Q_{wh}$	Horizontal wave shear force	kN	Ch 5, Sec 4, [3.4]

Table 4 : Scantlings

Symbol	Meaning	Unit	Reference
$I_{y-n50}$	Net vertical moment of inertia of hull girder, calculated with half corrosion reduction	m <sup>4</sup>	–
$I_{z-n50}$	Net horizontal moment of inertia of hull girder, calculated with half corrosion reduction	m <sup>4</sup>	–
$Z_{D-n50}$	Net vertical hull girder section moduli, at deck, calculated with half corrosion reduction	m <sup>3</sup>	–
$Z_{B-n50}$	Net vertical hull girder section moduli, at bottom, calculated with half corrosion reduction	m <sup>3</sup>	–
$z_n$	Vertical distance from BL to horizontal neutral axis	m	–
a	Length of an elementary plate panel (EPP)	mm	Ch 4, Sec 6, [2.1.1]
b	Breadth of an elementary plate panel (EPP)	mm	Ch 4, Sec 6, [2.1.1]
s	Stiffener spacing	mm	Ch 4, Sec 6, [1.2.1]
S	Primary supporting member spacing	m	Ch 4, Sec 6, [1.2.2]
$\ell$	Span of stiffeners or primary supporting members	m	Ch 4, Sec 6, [1]
$\ell_b$	Bracket arm length	m	–
t	Net thickness with full corrosion reduction	mm	–
$t_{n50}$	Net thickness with half corrosion reduction	mm	–
$t_c$	Corrosion addition	mm	–
$t_{gr}$	Gross thickness	mm	–
$t_{as\_built}$	As-built thickness taken as the actual thickness provided at the newbuilding stage	mm	–
$t_{gr\_off}$	Gross thickness offered	mm	–
$t_{gr\_req}$	Gross thickness required	mm	–
$t_{off}$	Net thickness offered	mm	–
$t_{req}$	Net thickness required	mm	–
$t_{vol\_add}$	Thickness for voluntary addition	mm	–
$t_{res}$	Reserve thickness, taken equal to 0,5	mm	–
$t_{c1}, t_{c2}$	Corrosion addition on each side of structural member	mm	–
$h_w$	Web height of stiffener or primary supporting member	mm	–
$t_w$	Web thickness of stiffener or primary supporting member	mm	–
$b_f$	Face plate width of stiffener or primary supporting member	mm	–
$h_{stf}$	Height of stiffener or primary supporting member	mm	–
$t_f$	Face plate/flange thickness of stiffener or primary supporting member	mm	–
$t_p$	Thickness of the plating attached to a stiffener or a primary supporting member	mm	–
$b_{eff}$	Effective breadth of attached plating, in bending, for yield and fatigue	mm	–
$A_{eff}$	Net sectional area of stiffener or primary supporting member, with attached plating of width s, calculated with full corrosion reduction	cm <sup>2</sup>	–
$A_{eff-n50}$	Net sectional area of stiffener or primary supporting member, with attached plating of width s, calculated with half corrosion reduction	cm <sup>2</sup>	–
$A_{shr}$	Net shear sectional area of stiffener or primary supporting member, calculated with full corrosion reduction	cm <sup>2</sup>	–
$A_{shr-n50}$	Net shear sectional area of stiffener or primary supporting member, calculated with half corrosion reduction	cm <sup>2</sup>	–
$I_p$	Net polar moment of inertia of a stiffener about its connection to plating	cm <sup>4</sup>	–
I	Net moment of inertia of a stiffener, with attached plating, about its neutral axis parallel to the plating	cm <sup>4</sup>	–
Z	Net section modulus of a stiffener or primary supporting member, with attached plating of breadth $b_{eff}$ , calculated with full corrosion reduction	cm <sup>3</sup>	–
$Z_{n50}$	Net section modulus of a stiffener or primary supporting member, with attached plating of breadth $b_{eff}$ , calculated with half corrosion reduction	cm <sup>3</sup>	–

## 2 Definitions

### 2.1 Ship's dimensions and main data

#### 2.1.1 Rule length

The rule length  $L$  is the distance, in m, measured on the waterline at the scantling draught  $T_{SC}$ , from the fore-side of the stem to the after side of the rudder post, or to the centre of the rudder stock where there is no rudder post.  $L$  is to be not less than 96% and need not exceed 97% of the extreme length on the waterline at the scantling draught  $T_{SC}$ .

In ships without rudder stock (e.g. ships fitted with azimuth thrusters), the rule length  $L$  is to be taken equal to 97% of the extreme length on the waterline at the scantling draught  $T_{SC}$ .

In ships with unusual stem or stern arrangements, the rule length is considered on a case-by-case basis.

#### 2.1.2 Load line length

The load line length  $L_{LL}$  shall be taken as 96% of the total length on a waterline at 85% of the least moulded depth measured from the top of the keel, or as the length from the fore side of the stem to the axis of the rudder stock on that waterline, if that be greater.

For ships without a rudder stock, the length  $L_{LL}$  is to be taken as 96% of the waterline at 85% of the least moulded depth.

Where the stem contour is concave above the waterline at 85% of the least moulded depth, both the forward terminal of the total length and the fore-side of the stem is taken at the vertical projection to that waterline of the aftermost point of the stem contour (see Fig 1).

In ship design with a rake of keel, the waterline on which this length is measured is parallel to the designed waterline at 85% of the least moulded depth  $D_{min}$  found by drawing a line parallel to the keel line of the ship (including skeg) tangent to the moulded sheer line of the freeboard deck. The least moulded depth is the vertical distance measured from the top of the keel to the top of the freeboard deck beam at side at the point of tangency (see Fig 2).

Figure 1 : Concave stem contour

Figure 2 : Length of ships with a rake of keel

#### 2.1.3 Subdivision length

The subdivision length  $L_S$  of the ship is the greatest projected moulded length of that part of the ship at or below deck or decks limiting the vertical extent of flooding with the ship at the deepest subdivision draught.

#### 2.1.4 Moulded breadth

The moulded breadth  $B$  is the greatest moulded breadth, in m, measured amidships at the scantling draught  $T_{SC}$ .

#### 2.1.5 Moulded depth

The moulded depth  $D$  is the vertical distance measured from the top of the keel to the top of the freeboard deck beam at side. Where the form at the lower part of the midship section is of a hollow character or where thick garboards are fitted, the distance is measured from the point where the line of the flat of the bottom continued inwards cuts the side of the keel.

*In ships having rounded gunwales, the moulded depth is to be measured to the point of intersection of the moulded lines of deck and sides, the lines extending as though the gunwales were of angular design.*

*Where the freeboard deck is stepped and the raised part of the deck extends over the point at which the moulded depth is to be determined, the moulded depth is to be measured to a line of reference extending from the lower part of the deck along a line parallel with the raised part.*

### 2.1.6 Draught

The draught  $T$ , in m, is the summer load line draught for the ship in operation, measured from the moulded baseline at midship.

Note 1: This may be less than the maximum permissible summer load waterline draught.

In the case of ships with a solid bar keel, the moulded base line is to be taken at the intersection between the upper face of the bottom plating with the solid bar keel at the middle of the length  $L$ .

$T_{SC}$  is the scantling draught, in m, at which the strength requirements for the scantlings of the ship are met and represents the full load condition. The scantling draught  $T_{SC}$  is to be not less than that corresponding to the assigned freeboard. The draught of ships to which timber freeboards are assigned corresponds to the loading condition of timber, and the requirements of the Society are to be applied to this draught.

$T_{LC}$  is the draught, in m, amidships for a considered load case

$T_{BAL}$  is the minimum design normal ballast draught amidships, in m, at which the strength requirements for the scantlings of the ship are met. This normal ballast draught is the minimum draught of ballast conditions including ballast water exchange operation, if any, for any ballast conditions in the loading manual including both departure and arrival conditions.

$T_{BAL-H}$  is the minimum design heavy ballast draught, in m, at which the strength requirements for the scantlings of the ship are met. This heavy ballast draught is to be considered for ships having heavy ballast condition.

### 2.1.7 Moulded displacement

The moulded displacement  $\Delta$ , in t, corresponds to the underwater volume of the ship, at draught  $T_{SC}$  in seawater with a density of 1,025 t/m<sup>3</sup>.

The moulded displacement  $\Delta_{LC}$ , in t, at a considered load case, corresponds to the underwater volume of the ship, at draught  $T_{LC}$ , in seawater with a density of 1,025 t/m<sup>3</sup>.

### 2.1.8 Maximum service speed

The maximum ahead service speed  $V$ , in knots, means the greatest speed which the ship is designed to maintain in service at her deepest seagoing draught at the maximum propeller RPM (revolution per minute) and corresponding engine MCR (maximum continuous rating).

### 2.1.9 Block coefficient

The block coefficient  $C_B$ , at scantling draught  $T_{SC}$ , is defined by:

$$C_B = \frac{\Delta}{1,025 L B T_{SC}}$$

The block coefficient  $C_{B-LC}$ , at a considered load case, is defined by:

$$C_{B-LC} = \frac{\Delta_{LC}}{1,025 L B T_{LC}}$$

### 2.1.10 Waterplane coefficient

The waterplane coefficient  $C_W$ , at scantling draught  $T_{SC}$ , is defined by:

$$C_W = \frac{A_{WP}}{L B}$$

where:

$A_{WP}$  : Waterplane area at scantling draught  $T_{SC}$ , in m<sup>2</sup>.

The waterplane coefficient  $C_{W-LC}$ , at a considered load case, is defined by:

$$C_{W-LC} = \frac{A_{WP-LC}}{L B}$$

where:

$A_{WP-LC}$  : Waterplane area at draught  $T_{LC}$ , in m<sup>2</sup>.

### 2.1.11 Lightweight

The lightweight is the ship displacement, in t, complete in all respects, but without cargo, consumable, stores, passengers and crew and their effects, and without any liquids on board except the machinery and piping fluids, such as lubricants and hydraulics, which are at operating levels.

**2.1.12 Deadweight**

The deadweight DWT is the difference, in t, between the displacement, at the summer draught in seawater of density  $\rho = 1,025 \text{ t/m}^3$ , and the lightweight.

**2.1.13 Fore end or forward perpendicular**

The fore end (FE) of the rule length  $L$  is the perpendicular to the scantling draught waterline at the forward side of the stem. See Fig 3.

**2.1.14 Aft end**

The aft end (AE) of the rule length  $L$  is the perpendicular to the scantling draught waterline at a distance  $L$  aft of the fore end. See Fig 3.

**Figure 3 : Fore end, Aft end and midship part**

**2.1.15 After perpendicular**

The after perpendicular is the perpendicular to the waterline at the after side of the rudder post on the summer load waterline. For ships without rudder post, the after perpendicular is the perpendicular to the waterline at the centre of the rudder stock on the summer load waterline.

**2.1.16 Midship**

The midship is the perpendicular to the scantling draught waterline at a distance  $0,5 L$  aft of the fore end.

**2.1.17 Midship part**

The midship part of a ship is the part extending  $0,4 L$  amidships, unless otherwise specified.

**2.2 Superstructure and deckhouse**

**2.2.1 Superstructure**

A superstructure is a decked structure on the freeboard deck extending from side to side of the ship or with the side plating not being inboard of the shell plating more than  $0,04 B$ .

**2.2.2 Deckhouse**

A deckhouse is a decked structure on the freeboard or superstructure deck which does not comply with the definition of a superstructure.

**2.2.3 Bridge**

A bridge is an elevated superstructure having a clear view forward and at each side, and from which a ship is steered.

**2.2.4 Enclosed/open superstructure**

Enclosed superstructure means a superstructure with bulkheads forward and/or aft fitted with weathertight doors and closing appliances.

An open superstructure is a superstructure which does not comply with the definition of a enclosed superstructure.

**2.2.5 Forecastle**

A forecastle is a short superstructure situated at the bow.

**2.2.6 Poop**

The poop is the superstructure located at the extreme aft end of the ship.

**2.2.7 Raised quarterdeck**

A raised quarterdeck is a partial superstructure of reduced height as defined in [2.2.9].

It extends forward from the after perpendicular and has an intact front bulkhead (sidescuttles of the non-opening type fitted with efficient deadlights and bolted man hole covers).

Where the forward bulkhead is not intact due to doors and access openings, the superstructure is then to be considered as a poop.

### 2.2.8 Trunk

A trunk is a decked structure similar to a deckhouse but not provided with a lower deck.

### 2.2.9 Standard height of superstructure

The standard height of superstructure is defined in Tab 5.

**Table 5 : Standard height of superstructure**

Load line length $L_{LL}$ , in m	Standard height $h_s$ , in m	
	Raised quarter deck	All other superstructures
$L_{LL} \leq 30$	0,90	1,80
$30 < L_{LL} < 75$	$0,9 + 0,00667 (L_{LL} - 30)$	1,80
$75 \leq L_{LL} < 125$	$1,2 + 0,012 (L_{LL} - 75)$	$1,8 + 0,01 (L_{LL} - 75)$
$L_{LL} \geq 125$	1,80	2,30

### 2.2.10 Tiers of superstructure

A tier is extending over one standard height of superstructure as defined in [2.2.9].

The lowest tier is the tier located immediately above the freeboard deck.

When the freeboard exceeds one standard superstructure height, as defined in [2.2.9] for “all other superstructures”, the lowest tier may be considered as an upper tier when calculating the scantlings of superstructures and deckhouses.

The second tier is the tier located immediately above the lowest tier, and so on.

## 2.3 Type A and Type B ships

### 2.3.1 Type A ship

A Type A ship is one which:

- is designed to carry only liquid cargoes in bulk;
- has a high integrity of the exposed deck with only small access openings to cargo compartments, closed by watertight gasketed covers of steel or equivalent material; and
- has low permeability of loaded cargo compartments.

A Type A ship is to be assigned a freeboard following the requirements reported in the International Load Line Convention 1966, as amended.

### 2.3.2 Type B ship

All ships which do not come within the provisions regarding Type A ships stated in [2.3.1] are to be considered as Type B ships.

A Type B ship is to be assigned a freeboard following the requirements reported in the International Load Line Convention 1966, as amended.

### 2.3.3 Type B-60 ship

A Type B-60 ship is any Type B ship of over 100 metres in length which, fulfilling the requirements reported in Ch 3, App 4, [4.4], is assigned with a value of tabular freeboard which can be reduced up to 60 per cent of the difference between the “B” and “A” tabular values for the appropriate ship lengths.

### 2.3.4 Type B-100 ships

A Type B-100 ship is any Type B ship of over 100 metres in length which, fulfilling the requirements reported in Ch 3, App 4, [4.4], is assigned with a value of tabular freeboard which can be reduced up to 100 per cent of the difference between the “B” and “A” tabular values for the appropriate ship lengths.

## 2.4 Positions 1 and 2

### 2.4.1 Position 1

Position 1 includes:

- exposed freeboard and raised quarter decks,
- exposed superstructure decks situated forward of  $0,25 L_{LL}$  from the perpendicular, at the forward side of the stem, to the waterline at 85% of the least moulded depth measured from the top of the keel.

### 2.4.2 Position 2

Position 2 includes:

- exposed superstructure decks situated aft of  $0,25 L$  from the perpendicular, at the forward side of the stem, to the waterline at 85% of the least moulded depth measured from the top of the keel and located at least one standard height of superstructure above the freeboard deck,

- *exposed superstructure decks situated forward of  $0,25 L_{LL}$  from the perpendicular, at the forward side of the stem, to the waterline at 85% of the least moulded depth measured from the top of the keel and located at least two standard heights of superstructure above the freeboard deck.*

## 2.5 Sister ship

2.5.1 A sister ship is a ship built by the same yard from the same plans.

## 2.6 Reference coordinate system

2.6.1 The ship's geometry, motions, accelerations and loads are defined with respect to the following right-hand coordinate system (see Fig 4):

Origin : At the intersection of the longitudinal plane of symmetry of ship, the aft end of L, and the baseline

X axis : Longitudinal axis, positive forwards

Y axis : Transverse axis, positive towards portside

Z axis : Vertical axis, positive upwards.

## 2.7 Arrangement

### 2.7.1 Aft peak

The aft peak is the area aft of the aft peak bulkhead.

The aft peak bulkhead is the first main transverse watertight bulkhead forward of the stern.

The aft peak tank is the compartment in the narrow part of the stern, aft of the aft peak bulkhead.

### 2.7.2 Bow

The bow is the structural arrangement and form of the forward end of the ship.

### 2.7.3 Bulkhead

A bulkhead is a structural partition wall subdividing the interior of the ship into compartments.

In a cargo ship the freeboard deck may be taken as the bulkhead deck.

An engine room bulkhead is a transverse bulkhead located either directly forward or aft of the engine room.

### 2.7.4 Compartment

A compartment is an internal space bounded by bulkheads or plating.

### 2.7.5 Deck

A deck is the horizontal structure element defining the upper or lower boundary of a compartment.

The freeboard deck is the deck designated as such by the designer, in accordance with International Convention on Load Lines (ICLL), generally the uppermost complete deck exposed to weather and sea, with permanent means of closing for all the exposed openings.

The strength deck is the uppermost continuous deck.

The superstructure deck is the deck forming the upper boundary of a superstructure.

### 2.7.6 Fore peak

The fore peak is the area of the ship forward of the collision bulkhead.

### 2.7.7 Stern

The stern is the after end of the vessel.

### 2.7.8 Tank

Tank is a generic term for space intended to carry liquid such as seawater, fresh water, oil, liquid cargoes, fuel oil, water ballast, etc.

### 2.7.9 Well

Well means any area on the deck exposed to the weather, where water may be entrapped. Wells are considered to be deck areas bounded on two or more sides by deck structures.

## 2.8 Structural components

### 2.8.1 Bilge plating

The bilge plating is the curved plating between the bottom shell and the side shell, to be taken as follows:

- Within the cylindrical part of the ship: from the start of the curvature at the lower turn of bilge on the bottom to the end of the curvature at the upper turn of the bilge
- Outside the cylindrical part of the ship: from the start of the curvature at the lower turn of the bilge on the bottom to the lesser of:
  - a point on the side shell located  $0,2D$  above the baseline/local centreline elevation
  - the end of the curvature at the upper turn of the bilge

### 2.8.2 Bottom shell

The bottom shell is the shell envelope plating forming the predominantly flat bottom portion of the shell envelope, including the keel plate.

### 2.8.3 Bracket

A bracket is an extra structural component used to increase the strength of a joint between two structural members

### 2.8.4 Double skin member

A double skin member is a structural member where the idealised beam comprises the web with top and bottom flanges formed by the attached plating.

### 2.8.5 Elementary plate panel (EPP)

An elementary plate panel is the smallest plate element surrounded by structural members such as stiffeners, PSM, bulkheads, etc.

### 2.8.6 Flange

A flange is a section of a stiffening member attached to the web, or sometimes formed by bending the web over. It is usually parallel to the plated surface.

### 2.8.7 Girder

Girder is a collective term for primary supporting structural members.

### 2.8.8 Keel

The keel is the main structural member or backbone of a ship running longitudinally along the centreline of the bottom, usually a flat plate stiffened by a vertical plate on its centreline inside the shell.

### 2.8.9 Plating

A plating is a sheet of steel supported by stiffeners, primary supporting members or bulkheads.

### 2.8.10 Primary supporting member (PSM)

A primary supporting member is a member of the beam, girder or stringer type, which provide the overall structural integrity of the hull envelope and tank boundaries, e.g. double bottom floors and girders, transverse side structure, deck transverses, bulkhead stringers and vertical webs on longitudinal bulkheads.

### 2.8.11 Shelf plate

A shelf plate is an horizontal plate located on the top of a bulkhead stool.

### 2.8.12 Shell envelope plating

The shell envelope plating is the shell plating forming the effective hull girder exclusive of the strength deck plating.

### 2.8.13 Side shell

The side shell is the shell envelope plating forming the side portion of the shell envelope above the bilge plating.

### 2.8.14 Single skin member

A single skin member is a structural member where the idealised beam comprises a web, a top flange formed by an attached plating and a bottom flange formed by a face plate.

### 2.8.15 Stiffener

Stiffener is a collective term for secondary supporting structural members.

### 2.8.16 Strake

Strake means course or row of shell, deck, bulkhead, or other plating.

### 2.8.17 Stringer

A stringer is an horizontal girder linking vertical web frames.

A stringer plate is the outside strake of deck plating.

### 2.8.18 Web

A web is a section of a stiffening member attached to the plated surface, usually perpendicular.

Web frame means a transverse primary supporting member, including deck transverse

## Section 4 Documentation to be Submitted

### 1 Documentation to be submitted for all ships

#### 1.1 Ships surveyed by the Society during the construction

##### 1.1.1 Plans and documents to be submitted for approval

The plans and documents to be submitted to the Society for approval are listed in Tab 1.

The above plans and documents are to be supplemented by further documentation which depends on the service notation and, possibly, the additional class notation (see Pt A, Ch 1, Sec 2) assigned to the ship, as specified in [2].

Structural plans are to show details of connections of the various parts and, in general, are to specify the materials used, including their manufacturing processes, welded procedures and heat treatments. See also Ch 13, Sec 1.

The structural drawings are to indicate for each structural element the as-built scantling and the renewal thickness as specified in Pt A, Ch 2, App 3, [4.5.3]. If thickness for voluntary addition, as defined in Ch 4, Sec 2, is included in the as-built thickness, this is to be clearly mentioned and identified on the drawings.

An alternative means for reporting the renewal thicknesses may be accepted by the Society on a case-by-case basis.

**Table 1 : Plans and documents to be submitted for approval for all ships**

Plan or document	Containing also information on
Midship section Transverse sections Shell expansion Decks and profiles Double bottom Pillar arrangements Framing plan Deep tank and ballast tank bulkheads, wash bulkheads	Class characteristics Main dimensions Minimum ballast draught Frame spacing Maximum ahead service speed Density of cargoes Design loads on decks and double bottom, including details of unitary loads, if any, as vehicles, steel coils, containers, etc. Steel grades Areas subjected to low temperatures Location and height of air vent outlets of various compartments Corrosion protection Welding details Openings in decks and shell and relevant compensations Boundaries of flat areas in bottom and sides Details of structural reinforcements and/or discontinuities Bilge keel with details of connections to hull structures Overpressure due to sustained liquid flow through air pipe or overflow pipe in case of overfilling or filling during flow through ballast water exchange Relief valve setting pressure Design still water bending moments and shear forces at midship
Loading manual and loading instruments	See Ch 1, Sec 5, [2]
Watertight subdivision bulkheads Watertight tunnels	Openings and their closing appliances, if any
Fore part structure	Location and height of air vent outlets of various compartments
Transverse thruster, if any, general arrangement, tunnel structure, connections of thruster with tunnel and hull structures	
Aft part structure	Location and height of air vent outlets of various compartments
Machinery space structures Foundations of propulsion machinery and boilers	Type, power and r.p.m. of propulsion machinery Mass and centre of gravity of machinery and boilers (1) Details, including SWL, of travelling gantry cranes, if any
Superstructures and deckhouses Machinery space casing	Extension and mechanical properties of the aluminium alloy used (where applicable)

Plan or document	Containing also information on
Bow doors, stern doors and inner doors, if any, side doors and other openings in the side shell	Closing appliances Electrical diagrams of power control and position indication circuits for bow doors, stern doors, side doors, inner doors, television system and alarm systems for ingress of water
Hatch covers, if any	Design loads on hatch covers Sealing and securing arrangements, type and position of locking bolts Distance of hatch covers from the summer load waterline and from the fore end
Bow or stern ramps, elevators for cargo handling and movable decks, if any	Structural arrangements of ramps, elevators and movable decks with their masses Arrangement of vehicles on ramps and movable decks and vehicles characteristics Arrangements of securing and locking devices Connection of ramps, lifting and/or hoisting appliances to the hull structures, with indication of design loads (amplitude and direction) Wire ropes and hoisting devices in working and stowed position Hydraulic jacks Loose gear (blocks, shackles, etc.) indicating the safe working loads and the testing loads Test conditions
Windows and side scuttles, arrangements and details	Type of material (glass, PMMA, PC) and its mechanical properties
Scuppers and sanitary discharges	
Bulwarks and freeing ports	Arrangement and dimensions of bulwarks and freeing ports on the freeboard deck and superstructure deck
Helicopter decks, if any	General arrangement Main structure Characteristics of helicopters: maximum mass, distance between landing gears or landing skids, print area of wheels or skids, distribution of landing gear loads
Rudder and rudder horn (1)	Maximum ahead service speed
Sternframe or sternpost, sterntube Propeller shaft boss and brackets (1)	
Derricks and cargo gear Cargo lift structures	Design loads (forces and moments) Connections to the hull structures
Sea chests, stabiliser recesses, etc.	Overpressure due to the inlet grating cleaning system
Hawse pipes	
Plan of outer doors and hatchways	
Plan of manholes	
Plan of access to and escape from spaces	
Plan of ventilation	Use of spaces
Plan of tank testing	Testing procedures for the various compartments Height of pipes for testing
Plan of watertight doors and scheme of relevant manoeuvring devices	Manoeuvring devices Electrical diagrams of power control and position indication circuits
Freeboard calculations	
Stability documentation	See Ch 3, Sec 1, [2.1]
Calculations relevant to intact stability and, where required, damage stability	
Equipment number calculation	Geometrical elements for calculation List of equipment Construction and breaking load of steel wires Material, construction, breaking load and relevant elongation of synthetic ropes
Emergency towing arrangement	See Ch 12, Sec 4
<b>(1)</b> Where other steering or propulsion systems are adopted (e.g. steering nozzles or azimuth propulsion systems), the plans showing the relevant arrangement and structural scantlings are to be submitted. For azimuth propulsion systems, see Ch 12, Sec 1, [11].	

### 1.1.2 Plans and documents to be submitted for information

In addition to those in [1.1.1], the following plans and documents are to be submitted to the Society for information:

- general arrangement
- capacity plan, indicating the volume and position of the centre of gravity of all compartments and tanks
- lines plan
- hydrostatic curves
- lightweight distribution
- towing and mooring arrangement plan as defined in Ch 12, Sec 4, [4.2.10].

In addition, when direct calculation analyses are carried out by the Designer according to the rule requirements, they are to be submitted to the Society.

## 1.2 Ships for which the Society acts on behalf of the relevant Administration

### 1.2.1 Plans and documents to be submitted for approval

The plans required by the National Regulations concerned are to be submitted to the Society for approval, in addition to those in [1.1].

## 2 Further documentation to be submitted for ships with certain service notations or additional class notations

### 2.1 General

**2.1.1** Depending on the service notation and, possibly, the additional class notation (see Pt A, Ch 1, Sec 2) assigned to the ship, other plans or documents may be required to be submitted to the Society, in addition to those in [1.1]. They are listed in the relevant parts of the Rules applicable to these notations as defined in Pt A, Ch 1, Sec 2.

# Section 5 Loading Manual and Loading Instruments

## 1 Loading manual and loading instrument requirement criteria

### 1.1 Ship categories

#### 1.1.1 Category I ships

- ships having large openings in the strength decks where combined stresses due to vertical and horizontal hull girder bending and torsional and lateral loads need to be considered
- ships liable to carry non-homogeneous loadings, where the cargo and/or ballast may be unevenly distributed; exception is made for ships less than 120 metres in length, when their design takes into account uneven distribution of cargo or ballast: such ships belong to Category II
- ships having the service notation **chemical tanker ESP** or **liquefied gas carrier**.

#### 1.1.2 Category II ships

- ships whose arrangement provides small possibilities for variation in the distribution of cargo and ballast
- ships on a regular and fixed trading pattern where the loading manual gives sufficient guidance
- the exception given under Category I.

### 1.2 Requirement criteria

#### 1.2.1 All ships

An approved loading manual is to be supplied for all ships equal to or greater than 65 m in length, except those of Category II less than 90 m in length in which the deadweight does not exceed 30% of the displacement at the summer loadline draught.

In addition, an approved loading instrument is to be supplied for all ships of Category I of 65 m in length and above.

The loading instrument is ship specific onboard equipment and the results of the calculations are only applicable to the ship for which it has been approved.

An approved loading instrument may not replace an approved loading manual.

1.2.2 In any case, when a loading instrument is present onboard, it is to be approved by the Society.

#### 1.2.3 Bulk carriers, ore carriers and combination carriers equal to or greater than 150 m in length

Ships with one of the service notations **bulk carrier**, **bulk carrier ESP**, **self-unloading bulk carrier ESP**, **ore carrier ESP** or **combination carrier ESP**, and equal to or greater than 150 m in length, are to be provided with an approved loading manual and an approved computer-based loading instrument, in accordance with the applicable requirements of this Section.

#### 1.2.4 Bulk carriers, ore carriers or combination carriers less than 150 m in length

Ships with one of the service notation **bulk carrier**, **bulk carrier ESP**, **self-unloading bulk carrier ESP**, **ore carrier ESP** or **combination carrier ESP**, and less than 150 m in length, are to be provided with an approved computer-based loading instrument in accordance with the applicable requirements of this Section. The approved loading instrument is to be capable of providing information on the ship's stability in the intact condition.

#### 1.2.5 Oil tankers and chemical tankers

Ships with one of the service notation **oil tanker ESP**, or **chemical tanker**, are to be provided with an approved computer-based loading instrument in accordance with the applicable requirements of this Section. The approved loading instrument is to be capable of verifying compliance with the intact and applicable damage stability requirements. Exemptions may be granted on a case by case basis.

## 2 Loading manual

### 2.1 Definitions

#### 2.1.1 All ships

A loading manual is a document which describes:

- the loading conditions on which the design of the ship has been based, including permissible limits of still water bending moment and shear force
- the results of the calculations of still water bending moments, shear forces and, where applicable, limitations due to torsional and lateral loads
- the allowable local loading for the structure (hatch covers, decks, double bottom, etc.).

**2.1.2 Bulk carriers, ore carriers and combination carriers equal to or greater than 150 m in length**

In addition to [2.1.1], for ships with one of the service notations **bulk carrier**, **bulk carrier ESP**, **self-unloading bulk carrier ESP**, **ore carrier ESP** or **combination carrier ESP**, and equal to or greater than 150 m in length, the loading manual is also to describe:

- for cargo holds of ships with the service notation **bulk carrier** or **bulk carrier ESP**: the envelope results and permissible limits of still water bending moments and shear forces in the hold flooded condition
- the cargo hold(s) or combination of cargo holds which might be empty at full draught
- hold mass curves for each single hold in the relevant loading conditions listed in Pt D, Ch 4, Sec 3, [3.1], showing the maximum allowable and the minimum required masses of cargo and double bottom contents of each hold as a function of the draught at mid-hold position (for determination of permissible mass in cargo holds, refer to Pt D, Ch 4, App 2)
- hold mass curves for any two adjacent holds in the relevant loading conditions listed in Pt D, Ch 4, Sec 3, [3.1], showing the maximum allowable and the minimum required masses of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds. This mean draught may be calculated by averaging the draught of the two mid-hold positions (for determination of permissible mass in cargo holds, refer to Pt D, Ch 4, App 2)
- maximum allowable tank top loading together with specification of the nature of the cargo for cargoes other than bulk cargoes
- maximum allowable load on deck and hatch covers. If the ship is not approved to carry load on deck or hatch covers, this is to be clearly stated in the loading manual
- the maximum rate of ballast change together with the advice that a load plan is to be agreed with the terminal on the basis of the achievable rates of change of ballast.

**2.2 Conditions of approval**

**2.2.1 All ships**

The approved loading manual is to be based on the final data of the ship. The manual is to include the design (cargo and ballast) loading conditions, subdivided into departure and arrival conditions as appropriate, upon which the approval of the hull scantlings is based, defined in Ch 5, Sec 8, [3.1.1].

In the case of modifications resulting in changes to the main data of the ship, a new approved loading manual is to be issued.

**2.2.2 Bulk carriers, ore carriers and combination carriers equal to or greater than 150 m in length**

In addition to [2.2.1], for ships with one of the service notations **bulk carrier**, **bulk carrier ESP**, **self-unloading bulk carrier ESP**, **ore carrier ESP** or **combination carrier ESP**, and equal to or greater than 150 m in length, the following loading conditions, subdivided into departure and arrival conditions as appropriate, are also to be included in the loading manual:

- alternate light and heavy cargo loading conditions at maximum draught, where applicable
- homogeneous light and heavy cargo loading conditions at maximum draught
- ballast conditions  
For ships with ballast holds adjacent to topside wing, hopper and double bottom tanks, it may be acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty
- short voyage conditions where the ship is to be loaded to maximum draught but with a limited amount of bunkers
- Multi-port (MP) loading/unloading conditions
- deck cargo conditions, where applicable
- typical loading sequences where the ship is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, relevant part load conditions and alternate conditions where applicable. Typical unloading sequences for these conditions are also to be included  
The typical loading/unloading sequences are also to be developed to not exceed applicable strength limitations. The typical loading sequences are also to be developed paying due attention to the loading rate and deballasting capability
- typical sequences for change of ballast at sea, where applicable.

**2.2.3 Language**

The loading manual is to be prepared in a language understood by the users. If this is not English, a translation into English is to be included.

**3 Loading instrument**

**3.1 Additional class notations LI**

**3.1.1** The additional class notations **LI-HG**, **LI-S1**, **LI-S2**, **LI-S3**, **LI-S4**, **LI-HG-S1**, **LI-HG-S2**, **LI-HG-S3**, **LI-HG-S4** and **LI-LASHING** may be assigned in accordance with Pt A, Ch 1, Sec 2, [6.16.1] to ships equipped with a loading instrument, as defined in [3.1.2].

**3.1.2** When the ship is equipped with a loading instrument performing:

- only hull girder calculations, the additional class notation **LI-HG** is assigned
- only intact stability calculations (when the ship is not required to meet damage stability requirements), the additional class notation **LI-S1** is assigned

- intact stability calculations and damage stability on a basis of a limit curve, the additional class notation **LI-S2** is assigned
- intact stability calculations and direct damage stability calculations based on pre-programmed damage cases, the additional class notation **LI-S3** is assigned.
- damage stability calculations associated with an actual loading condition and actual flooding case, using direct application of user defined damage, for the purpose of providing operational information for safe return to port, the additional class notation **LI-S4** is assigned.
- lashing calculations, the additional class notation **LI-LASHING** is assigned.

When the loading instrument performs hull girder and stability calculations, the additional class notation **LI-HG-S1**, **LI-HG-S2**, **LI-HG-S3**, **LI-HG-S4** is assigned, as applicable.

## **3.2 Definitions**

### **3.2.1 All ships**

A loading instrument is an instrument which is either analog or digital and by means of which it can be easily and quickly ascertained that, at specified read-out points, the still water bending moments, shear forces and still water torsional moments and lateral loads, where applicable, in any load or ballast condition, do not exceed the specified permissible values.

An operational manual is always to be provided for the loading instrument.

Single point loading instruments are not acceptable.

The approval of a loading instrument for lashing calculation is to be performed according to the approval of lashing software as applicable in Pt F, Ch 12, Sec 5.

### **3.2.2 Bulk carriers, ore carriers and combination carriers equal to or greater than 150 m in length**

For ships with one of the service notations **bulk carrier**, **bulk carrier ESP**, **self-unloading bulk carrier ESP**, **ore carrier ESP** or **combination carrier ESP**, and equal to or greater than 150 m in length, the loading instrument is an approved digital system as defined in [3.2.1]. In addition to [3.2.1], it is also to ascertain as applicable that:

- the mass of cargo and double bottom contents in way of each hold as a function of the draught at mid-hold position
- the mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds
- the still water bending moment and shear forces in the hold flooded conditions, where required,

do not exceed the specified permissible values.

## **3.3 Conditions of approval**

### **3.3.1 All ships**

The loading instrument is subject to approval, which is to include:

- verification of type approval, if any
- verification that the final data of the ship have been used
- acceptance of number and position of all read-out points
- acceptance of relevant limits for read-out points
- checking of proper installation and operation of the instrument on board, under agreed test conditions, and that a copy of the operation manual is available.

### **3.3.2 Bulk carriers, ore carriers and combination carriers equal to or greater than 150 m in length**

In addition, for ships with one of the service notations **bulk carrier**, **bulk carrier ESP**, **self-unloading bulk carrier ESP**, **ore carrier ESP** or **combination carrier ESP**, and equal to or greater than 150 m in length, the approval is also to include, as applicable:

- acceptance of hull girder bending moment limits for all read-out points
- acceptance of hull girder shear force limits for all read-out points
- acceptance of limits for the mass of cargo and double bottom contents of each hold as a function of draught (for determination of permissible mass in cargo holds, refer to Pt D, Ch 4, App 2)
- acceptance of limits for the mass of cargo and double bottom contents in any two adjacent holds as a function of draught (for determination of permissible mass in cargo holds, refer to Pt D, Ch 4, App 2).

**3.3.3** In the case of modifications implying changes in the main data of the ship, the loading instrument is to be modified accordingly and approved.

**3.3.4** The operation manual and the instrument output are to be prepared in a language understood by the users. If this is not English, a translation into English is to be included.

**3.3.5** The operation of the loading instrument is to be verified upon installation under the agreed test conditions. It is to be checked that the agreed test conditions and the operation manual for the instrument are available on board.

**3.3.6** When the loading instrument also performs stability calculations, it is to be approved for stability purposes in accordance with the procedures indicated in [3.6], [3.7] and [3.8], as applicable.

### **3.4 Approval procedure**

#### **3.4.1 General**

The loading instrument approval process includes the following procedures for each ship:

- data verification which results in endorsed test conditions
- approval of computer hardware, where necessary, as specified in Pt C, Ch 3, Sec 6, [2.4.1]
- installation testing which results in an Installation Test Report.

#### **3.4.2 Data verification approval - Endorsed test conditions**

The Society is to verify the results and actual ship data used by the calculation program for the particular ship on which the program will be installed.

Upon application for data verification, the Society is to advise the applicant of a minimum of four loading conditions, taken from the ship's approved loading manual, which are to be used as the test conditions. Within the range of these test conditions, each compartment is to be loaded at least once. The test conditions normally cover the range of load draughts from the deepest envisaged loaded condition to the light ballast condition. In addition, the lightship test condition is to be submitted.

When the additional class notation **LI-S4** is assigned, at least three damage cases are to be examined, each of them associated with at least three loading conditions taken from the ship's approved stability information. Output of the software is to be compared with results of corresponding load / damage case in the approved damage stability booklet or an alternative independent software source.

When the loading instrument also performs stability calculations, it is to cover all the stability requirements applicable to the ship. The test conditions are to be taken from the ship's approved trim and stability booklet.

The data indicated in [3.4.3] and contained in the loading program are to be consistent with the data specified in the approved loading manual. Particular attention is drawn to the final lightship weight and centres of gravity derived from the inclining experiment or lightweight check.

The approval of the computer application software is based on the acceptance of the results of the test conditions according to [3.5], [3.6], [3.7], and [3.8], as applicable.

When the requested information has been submitted and the results of the test conditions are considered satisfactory, the Society endorses the test conditions, a copy of which is to be available on board.

#### **3.4.3 Data to be submitted**

The following data, submitted by the applicant, are to be consistent with the as-built ship:

- identification of the calculation program including the version number
- main dimensions, hydrostatic particulars and, if applicable, ship profile
- position of the forward and after perpendiculars and, if appropriate, the calculation method to derive the forward and after draughts at the actual position of the ship's draught marks
- ship lightweight and lightweight distribution along the ship's length
- lines plans and/or offset tables
- compartment definitions, including frame spacing and centre of volumes, together with capacity tables (sounding/ullage tables), if appropriate
- deadweight definitions for each loading condition.

#### **3.4.4 Installation testing**

During the installation test, one of the ship's senior officers is to operate the loading instrument and calculate the test conditions. This operation is to be witnessed by a Surveyor of the Society. The results obtained from the loading instrument are to be identical to those stated in the endorsed test conditions. If the numerical output from the loading instrument is different from the endorsed test conditions, no approval will be confirmed.

An installation test is also to be carried out on the second nominated computer, when applicable as indicated in Pt C, Ch 3, Sec 6, [2.4.1], which would be used in the event of failure of the first computer. Where the installation test is carried out on a type approved computer, a second nominated computer and test are not required.

Subject to the satisfactory completion of installation tests, the Society's Surveyor endorses the test conditions, adding details of the place and the date of the installation test survey, as well as the Society stamp and the Surveyor's signature.

#### **3.4.5 Operational manual**

A uniquely identified ship specific operational manual is to be submitted to the Society for documentation.

The operational manual is to be written in a concise and unambiguous manner. The use of illustrations and flowcharts is recommended.

The operational manual is to contain:

- a general description of the program denoting identification of the program and its stated version number
- details of the hardware specification needed to run the loading program
- a description of error messages and warnings likely to be encountered, and unambiguous instructions for subsequent actions to be taken by the user in each case
- where applicable, the shear force correction factors
- where applicable, the local permissible limits for single and two adjacent hold loadings as a function of the appropriate draught and the maximum weight for each hold
- where applicable, the Society's restrictions (maximum allowable load on double bottom, maximum specific gravity allowed in liquid cargo tanks, maximum filling level or percentage in liquid cargo tanks)
- example of a calculation procedure supported by illustrations and sample computer output
- example computer output of each screen display, complete with explanatory text.

### 3.4.6 Calculation program specifications

The software is to be written so as to ensure that the user cannot alter the critical ship data files containing the following information:

- lightship weight and lightship weight distribution and associated centres of gravity
- the Society's structural limitations or restrictions
- geometric hull form data
- hydrostatic data and cross curves, where applicable
- compartment definitions, including frame spacing and centre of volumes, together with capacity tables (sounding/ullage tables), if appropriate
- when intact stability criteria are given, a listing of all calculated stability criteria with the obtained values and the conclusions (criteria fulfilled or not fulfilled), the down-flooding angle and the corresponding down-flooding opening.

Any changes in the software are to be made by the manufacturer or his appointed representative and the Society is to be informed immediately of such changes. Failure to advise of any modifications to the calculation program may invalidate the approval issued. In cases where the approval is considered invalid by the Society, the modified calculation program is to be re-assessed in accordance with the approval procedure.

### 3.4.7 Functional specification

The calculation program is to be user-friendly and designed such that it limits possible input errors by the user.

The forward, midship and after draughts, at the respective perpendiculars, are to be calculated and presented to the user on screen and hardcopy output in a clear and unambiguous manner.

It is recommended that the forward, midship and after draughts, at the actual position of the ship's draught marks are calculated and presented to the user on screen and hard copy output in a clear and unambiguous manner.

The displacement is to be calculated for the specified loading condition and corresponding draught readings and presented to the user on screen and hardcopy output.

The loading instrument is to be capable of producing print-outs of the results in both numerical and graphical forms. The numerical values are to be given in both forms, as absolute values and as the percentage of the permissible values. This print-out is to include a description of the corresponding loading condition.

All screen and hardcopy output data is to be presented in a clear and unambiguous manner with an identification of the calculation program (the version number is to be stated).

When the additional class notation **LI-S3** is assigned, the software is to include pre-defined relevant damage cases for both sides of the ship according to the applicable rules for automatic check of a given loading condition.

When the additional class notation **LI-S3** or **LI-S4** is assigned, the damage stability is to be based on a hull form model, that is, directly calculated from a full three-dimensional geometric model. In addition, the system shall be pre-loaded with a detailed computer model of the complete hull, including appendages, all compartments, tanks and the relevant parts of the superstructure considered in the damage stability calculation, wind profile, down-flooding and up-flooding openings, cross-flooding arrangements, internal compartment connections and escape routes, as applicable and according to the type of stability software.

When the additional class notation **LI-S1** or **LI-S2** is assigned, in case a full three dimensional model is used for stability calculations, the requirements of the computer model for the additional class notation **LI-S3** or **LI-S4** are applicable.

*For ships engaged in anchor handling operations, planning tools are to be provided in compliance with operational manual requirements. Information such as ballasting and consumables sequences, permissible tension, working sectors, heeling angles and use of roll-reduction devices are to be stated.*

**3.4.8 Specific functional requirements for LI-S4**

The software used for damage stability for SRTP need not to be totally separated from other software used for normal stability.

When the software for damage stability for SRTP is not separated:

- the function of switching between normal software and SRTP software is to be provided
- the actual intact loading condition is to be the same for both functions (normal operation and SRTP)
- the SRTP module needs only to be activated in case of an incident.

For passenger ships which are subject to SRTP and have an onboard stability computer and shore-based support, such software need not be identical.

Each internal space is to be assigned its permeability as given in Tab 1, unless a more accurate permeability has been reflected in the approved stability information.

The system is to be capable of accounting for applied moments such as wind, lifeboat launching, cargo shifts and passenger relocation.

The system is to take into account for the effect of wind by using the method in SOLAS regulation II-1/7-2.4.1.2 as the default, but allow for manual input of the wind speed/pressure if the on-scene pressure is significantly different ( $P = 120 \text{ N/m}^2$  equates to Beaufort 6; approximately 13,8 m/s or 27 knots).

The system is to be capable of assessing the impact of open main watertight doors on stability (e.g. for each damage case provided for verification, additional damage stability calculation shall be done and presented, taking into account any watertight door located within the damaged compartment(s)).

The system is to utilize the latest approved lightship weight and centre of gravity information.

The output of the software is to be such that it provides the master with sufficient clear unambiguous information to enable quick and accurate assessment of the stability of the vessel for any actual damage, the impact of flooding on the means of escape and the controls of devices necessary for managing and/or controlling the stability of the ship.

When the actual loading condition is input in the software, in addition to the information required in [3.4.6] and in [3.4.7], the following output corresponding to intact stability are to be available:

- free surfaces
- GZ values relevant to an adequate range of heeling (not less than 60°) available indicatively at the following intervals: 0 5 10 15 20 25 30 40 50 60 deg
- GM/KG limiting curve according to SOLAS, Ch II-1, Regulation 5-1

When the actual loading condition is associated to the actual damage case(s) due to the casualty, in addition to the information required in [3.4.6] and in [3.4.7], the following output corresponding to the damage stability are to be available:

- progressive flooding angle and corresponding progressive flooding openings
- GM value
- GZ values relevant to an adequate range of heeling (not less than 60°) available indicatively at the following intervals: 0 5 10 15 20 25 30 40 50 60 deg
- the survivability criteria are left to the discretion of the Society
- relevant flooding points (unprotected or weathertight) with the distance from the damage waterline to each point
- list of all flooded compartments with the permeability considered
- amount of water in each flooded compartment
- escape route immersion angles
- a profile view, deck views and cross-sections of the ship indicating the flooded waterplane and the damaged compartments.

For Ro-Ro Passenger ships subject to the Stockholm Agreement (IMO Circular Letter No. 1891), the software is to include algorithms for estimating the effect of water accumulation on deck (WOD). For example, in addition to the predefined significant wave height taken from the approved stability document, the software allows the crew to input manually the significant wave height of the ship navigation area. For checking the correctness of the algorithms for estimating the effect of WOD, the calculations with two additional significant wave heights are to be submitted.

**Table 1 : Permeability for internal spaces**

Spaces	Default	Full	Partially filled	Empty
Container spaces	0,95	0,70	0,80	0,95
Dry cargo spaces	0,95	0,70	0,80	0,95
Ro-Ro spaces	0,95	0,90	0,90	0,95
Cargo liquids	0,95	0,70	0,80	0,95
Intended for consumable liquids	0,95	0,95	0,95	0,95
Stores	0,95	0,60	0,60	0,95
Occupied by machinery	0,85			
Void spaces	0,95			
Occupied by accommodation	0,95			

**3.5 Hull girder forces and moments**

**3.5.1 General**

The loading program is to be capable of calculating the following hull girder forces and moments in accordance with Ch 5, Sec 4, [2]:

- Still Water Shear Force (SWSF) including the shear force correction, where applicable
- Still Water Bending Moment (SWBM)
- Still Water Torsion Moment (SWTM), where applicable
- for ships with relatively large openings in the strength deck, additional considerations such as torsional loads are to be considered.

The data which are to be provided to, or accepted by, the Society are specified in Tab 3.

Read-out points are usually to be selected at the position of the transverse bulkheads or other obvious boundaries. Additional read-out points may be required between bulkheads of long holds or tanks, or between container stacks.

Where the still water torsion moments are required to be calculated, one test condition is to demonstrate such a calculation.

The calculated forces and moments are to be displayed in both graphical and tabular formats, including the percentage of permissible values. The screen and hardcopy output is to display the calculated forces or moments, and the corresponding permissible limits, at each specified read-out point. Alternative limits may be considered by the Society on a case by case basis.

**3.5.2 Acceptable tolerances**

The accuracy of the calculation program is to be within the acceptable tolerance band, specified in Tab 2, of the results at each read-out point obtained by the Society, using an independent program or the approved loading manual with identical input.

**3.5.3 Permissible limits and restrictions**

The user is to be able to view the following Society structural limitations in a clear and unambiguous manner:

- all permissible still water shear forces and still water bending moments
- where applicable, the permissible still water torsion moments
- where applicable, all local loading limits both for one hold and for adjacent hold loadings
- cargo hold weight
- ballast tank/hold capacities
- filling restrictions.

It is to be readily apparent to the user when any of the structural limits has been exceeded.

**Table 2 : Tolerance band for the comparison of computational accuracy**

Computation	Tolerance (percentage of the permissible values)
Still Water Shear Force	± 5%
Still Water Bending Moment	± 5%
Still Water Torsion Moment, where applicable	± 5%

**Table 3 : Data to be provided to, or to be accepted by, the Society**

Calculation	Data to be provided to, or accepted by, the Society
Still Water Shear Force (SWSF)	<ul style="list-style-type: none"> <li>• The read-out points (frame locations) for the SWSF calculations. These points are normally selected at the position of the transverse bulkhead or other obvious boundaries. Additional read-out points may be specified between the bulkheads of long holds or tanks or between container stacks.</li> <li>• Shear force correction factors and method of application.</li> <li>• The permissible seagoing and harbour SWSF limits at the read-out points. Where appropriate, additional sets of permissible SWSF values may be specified.</li> </ul>
Still Water Bending Moment (SWBM)	<ul style="list-style-type: none"> <li>• The read-out points (frame locations) for the SWBM calculations. These points are normally selected at the position of the transverse bulkhead, mid-hold or other obvious boundaries.</li> <li>• The permissible seagoing and harbour SWBM limits at the read-out points. Where appropriate, additional sets of permissible SWBM values may be specified.</li> </ul>
Still Water Torsion Moment (SWTM), where applicable	<ul style="list-style-type: none"> <li>• The read-out points (frame locations) for the SWTM calculations, where applicable.</li> <li>• The permissible limits at the read-out points.</li> </ul>

### **3.6 Intact stability**

#### **3.6.1 Application**

The loading instrument approval for stability purposes is required when a loading instrument to be installed on board a ship performs stability calculations, as stated in [3.3.6].

#### **3.6.2 Data verification approval - Endorsed test conditions**

The requirements in [3.4.2] apply. In addition, at least one of the four loading conditions required is to show the compartments, intended for liquid loads in which the free surface effect is considerable, filled in order to have the maximum free surface moment.

The additional data necessary for the approval of the loading instrument for stability purposes are specified in [3.6.3].

In order to obtain the approval of the loading instrument, all the intact stability requirements (and relevant criteria) applicable to the ship, reported in Ch 4, Sec 2 as well as in Part D or Part E, are to be available in the computer output; the lack of any one of them is sufficient to prevent the endorsement of the test conditions.

#### **3.6.3 Additional data to be submitted**

In addition to the data required in [3.4.3], the following are to be submitted:

- cross curves of stability calculated on a free trimming basis, for the ranges of displacement and trim anticipated in normal operating conditions, with indication of the volumes which have been considered in the computation of these curves
- capacity tables indicating, for each compartment or space, the values of the co-ordinates  $X_G$ ,  $Y_G$  and  $Z_G$  of the centre of gravity, as well as the inertia, corresponding to an adequate number of filling percentages
- list of all the openings (location, tightness, means of closure), pipes or other sources which may lead to progressive flooding
- deadweight definitions for each loading condition in which, for any load taken into account, the following information is to be specified:
  - weight and centre of gravity co-ordinates
  - percentage of filling (if liquid load)
  - free surface moment (if liquid load)
- information on loading restrictions (maximum filling level or percentage in liquid cargo tanks, maximum KG or minimum GM curve or table which can be used to determine compliance with the applicable intact and damage stability criteria), when applicable
- all the intact stability criteria applicable to the ship concerned.

### **3.7 Grain loading**

#### **3.7.1 Application**

The loading instrument approval for stability purposes is required when a loading instrument to be installed on board a ship performs grain loading stability calculations, as stated in [3.3.6].

In such case, the loading instrument is also to perform intact stability calculations, and therefore the approval is to be based on the requirements specified in [3.6].

Additional requirements relevant to grain stability are provided in [3.7.2] and [3.7.3].

#### **3.7.2 Data verification approval - Endorsed test conditions**

The requirements stated in [3.6.2] apply. In addition, when the ship is allowed to carry grain in slack hold, at least one of the four loading conditions required is to include partially filled holds.

The additional data necessary for the approval of the loading instrument for grain stability purposes are specified in [3.7.3].

In order to obtain the approval of the loading instrument, all the grain stability requirements and relevant criteria specified in NR 467 Pt D, Ch 4, Sec 3, [1.2] are to be available in the computer output.

In addition, the outputs are to include:

- the reference to the type of calculation (trimmed or untrimmed ends)
- the value of the actual grain heeling moment for each hold
- the value of the maximum permissible grain heeling moment for each hold
- the total value of the actual grain heeling moment
- the total value of the maximum permissible grain heeling moment.

The lack of any of the above is sufficient to prevent the endorsement of the test conditions.

#### **3.7.3 Additional data to be submitted**

In addition to the data required in [3.6.3], the following are to be submitted:

- calculation of the total grain heeling moment
- calculation of the maximum permissible total grain heeling moment as a function of the draught (or displacement) and maximum KG

- curves or tables of volume, centre of volume and volumetric heeling moment for partially filled compartments (if applicable)
- for filled holds: volumetric heeling moment for trimmed and/or untrimmed ends, as applicable, including temporary bulkheads, if any.

### **3.8 Damage stability**

#### **3.8.1 Application**

The loading instrument approval for stability purposes is required when a loading instrument to be installed on board a ship performs damage stability calculations, as stated in [3.3.6].

In such case, the loading instrument is also to perform intact stability calculations, and therefore the approval is to be based on the requirements specified in [3.6].

Additional requirements relevant to damage stability are given in [3.8.2] and [3.8.3].

#### **3.8.2 Data verification approval - Endorsed test conditions**

The requirements specified in [3.6.2] apply.

The additional data necessary for the approval of the loading instrument for stability purposes are specified in [3.8.3].

The approval of damage stability calculations performed by a loading instrument is limited to those relevant to deterministic damage stability rules specified in Part D applicable to ships with one of the service notations **passenger ship**, **oil tanker ESP**, **chemical tanker ESP** or **liquefied gas carrier**. In order to obtain the approval of the loading instrument, all the damage stability requirements (and relevant criteria) applicable to the ship are to be available in the computer output. The lack of any one of them is sufficient to prevent the endorsement of the test conditions.

#### **3.8.3 Additional data to be submitted**

In addition to the data required in [3.6.3], the following are to be submitted:

- List of all the damage cases which are to be considered in accordance with the relevant deterministic damage stability rules. Each damage case is to clearly indicate all the compartments or spaces taken into account, as well as the permeability associated with each compartment or space.  
This information is to be taken from the approved damage stability documentation, and the source details are to be clearly indicated; in the case of unavailability of such documentation, the above-mentioned information may be requested from the Society
- All the damage stability criteria applicable to the ship concerned.

### **3.9 Acceptable tolerances**

#### **3.9.1 General**

The acceptable tolerances for the stability particulars are to be in agreement with the requirements of IACS Unified Requirements UR L5 as amended.

# Appendix 1

## Equivalences between Current Revision and July 2021 Edition of the Rules for the Classification of Steel Ships

### 1 General

#### 1.1 Equivalences between current revision and edition July 2021 of NR467, Part B

1.1.1 Tab 1 provides equivalences between the provisions of the current revision of the Rules and former revision (Edition July 2021 amended in January 2022).

**Table 1 : Equivalences between current revision and edition July 2021 of NR467, Part B**

# Part B

## Hull and Stability

---

### CHAPTER 2

## GENERAL ARRANGEMENT DESIGN

---

- Section 1      Subdivision Arrangement
- Section 2      Compartment Arrangement
- Section 3      Access Arrangement

# Section 1 Subdivision Arrangement

## 1 General

### 1.1 Application to ships having additional service feature SPxxx or SPxxx-capable

**1.1.1** Ships having additional service feature **SPxxx** or **SPxxx-capable** with xxx equal to or greater than 240 are to comply, in addition to the applicable requirements of this Section, with the requirements of Pt D, Ch 11, Sec 2, considering the special personnel as passengers.

**1.1.2** Ships having additional service feature **SPxxx** or **SPxxx-capable** with xxx less than 240 are to comply with the requirements of this Section, unless otherwise specified, considering the special personnel as crew.

## 2 Number and arrangement of transverse watertight bulkheads

### 2.1 Number of watertight bulkheads

#### 2.1.1 General

All ships, in addition to complying with the requirements of [2.1.2], are to have at least the following transverse watertight bulkheads:

- one collision bulkhead
- one after peak bulkhead
- two bulkheads forming the boundaries of the machinery space in ships with machinery amidships, and a bulkhead forward of the machinery space in ships with machinery aft. In the case of ships with an electrical propulsion plant, both the generator room and the engine room are to be enclosed by watertight bulkheads.

#### 2.1.2 Additional bulkheads

For ships not required to comply with subdivision regulations, transverse bulkheads adequately spaced and in general not less in number than indicated in Tab 1 are to be fitted.

Additional bulkheads may be required for ships having to comply with subdivision or damage stability criteria (see Part D or Part E for the different types of ships).

**Table 1 : Number of bulkheads**

Length (m)	Number of bulkheads for ships with aft machinery (1)	Number of bulkheads for other ships
$L < 65$	3	4
$65 \leq L < 85$	4	5
$85 \leq L < 105$	4	5
$105 \leq L < 120$	5	6
$120 \leq L < 145$	6	7
$145 \leq L < 165$	7	8
$165 \leq L < 190$	8	9
$L \geq 190$	to be defined on a case by case basis	

(1) After peak bulkhead and aft machinery bulkhead are the same.

### 2.2 Water ingress detection

**2.2.1** A water ingress detection system is to be fitted according to Pt C, Ch 1, Sec 10, [6.12].

## 3 Collision bulkhead

### 3.1

**3.1.1** A collision bulkhead is to be fitted which is to be watertight up to the bulkhead deck of passenger ships and the freeboard deck of cargo ships. This bulkhead is to be located at a distance from the forward perpendicular  $FP_{LL}$  of not less than 5 per cent of the length  $L_{LL}$  of the ship or 10 m, whichever is the less, and, except as may be permitted by the Society, not more than 8 per cent of  $L_{LL}$  or 5 per cent of the  $L_{LL} + 3$  m, whichever is the greater.

For ships not covered by the SOLAS Convention, the length  $L_{LL}$  need not be taken less than 50 m, unless required by the National Authorities.

**3.1.2** Where any part of the ship below the waterline extends forward of the forward perpendicular, e.g. a bulbous bow, the distances, in metres, stipulated in [3.1.1] are to be measured from a point either:

- at the mid-length of such extension, or
- at a distance 1,5 per cent of the length  $L_{LL}$  of the ship forward of the forward perpendicular, or
- at a distance 3 metres forward of the forward perpendicular; whichever gives the smallest measurement.

**3.1.3** The bulkhead may have steps or recesses provided they are within the limits prescribed in [3.1.1] or [3.1.2].

No door, manhole, ventilation duct or any other opening is to be fitted in the collision bulkhead below the bulkhead deck of passenger ships and the freeboard deck of cargo ships.

**3.1.4** At Owner request and subject to the agreement of the flag Administration, the Society may, on a case by case basis, accept a distance from the collision bulkhead to the forward perpendicular  $FP_{LL}$  greater than the maximum specified in [3.1.1] and [3.1.2], provided that subdivision and stability calculations show that, when the ship is in upright condition on full load summer waterline, flooding of the space forward of the collision bulkhead will not result in any part of the freeboard deck becoming submerged, or in any unacceptable loss of stability.

In such a case, the attention of the Owner and the Shipyard is drawn to the fact that the flag Administration may impose additional requirements and that such an arrangement is, in principle, formalised by the issuance of a certificate of exemption under the SOLAS Convention provisions. Moreover, in case of change of flag, the taking Administration may not accept the exemption.

**3.1.5** Where a long forward superstructure is fitted, the collision bulkhead is to be extended weathertight to the next deck above the bulkhead deck of passenger ships and the freeboard deck of cargo ships. The extension need not be fitted directly above the bulkhead below provided that all parts of the extension, including any part of the ramps attached to it, are located within the limits prescribed in [3.1.1] or [3.1.2] with the exemption permitted by [3.1.6] and the part of the deck which forms the step is made effectively weathertight. The extension is to be so arranged as to preclude the possibility of the bow door or ramp, where fitted, causing damage to it in the case of damage to, or detachment of, a bow door or any part of the ramp.

**3.1.6** Where bow doors are fitted and a sloping loading ramp forms part of the extension of the collision bulkhead above the bulkhead deck of passenger ships and the freeboard deck of cargo ships, the ramp is to be weathertight over its complete length. In cargo ships, the part of the ramp which is more than 2,3 m above the freeboard deck may extend forward of the limit specified in [3.1.1] or [3.1.2]. Ramps not meeting the above requirements are to be disregarded as an extension of the collision bulkhead.

**3.1.7** The number of openings in the extension of the collision bulkhead above the freeboard deck is to be restricted to the minimum compatible with the design and normal operation of the ship. All such openings are to be capable of being closed weathertight.

## **4 After peak, machinery space bulkheads and stern tubes**

### **4.1**

#### **4.1.1 General**

Bulkheads are to be fitted separating the machinery space from cargo and accommodation spaces forward and aft and made watertight up to the bulkhead deck of passenger ships and the freeboard deck of cargo ships. An after peak bulkhead is also to be fitted and made watertight up to the bulkhead deck or the freeboard deck. The after peak bulkhead may, however, be stepped below the bulkhead deck or the freeboard deck, provided the degree of safety of the ship as regards subdivision is not thereby diminished.

#### **4.1.2 Sterntubes**

In all cases, sterntubes are to be enclosed in watertight spaces of moderate volume. In passenger ships, the stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the sterntube compartment and of such volume that, if flooded by leakage through the stern gland, the bulkhead deck will not be immersed. In cargo ships, other measures to minimise the danger of water penetrating into the ship in case of damage to sterntube arrangements may be taken at the discretion of the Society.

For ships less than 65 m, where the after peak bulkhead in way of the sterntube stuffing box is not provided, sterntubes are to be enclosed in watertight spaces of moderate volume.

## 5 Height of transverse watertight bulkheads other than collision bulkhead and after peak bulkhead

### 5.1

**5.1.1** Transverse watertight bulkheads are to extend watertight up to the bulkhead deck. In exceptional cases at the request of the Owner, the Society may allow transverse watertight bulkheads to terminate at a deck below that from which freeboard is measured, provided that this deck is at an adequate distance above the full load waterline.

**5.1.2** Where it is not practicable to arrange a watertight bulkhead in one plane, a stepped bulkhead may be fitted. In this case, the part of the deck which forms the step is to be watertight and equivalent in strength to the bulkhead.

## 6 Openings in watertight bulkheads and decks for ships having a service notation other than passenger ship or ro-ro passenger ship

### 6.1 Application

**6.1.1** The requirements in [6.2] and [6.3] apply to ships having a service notation other than **passenger ship** or **ro-ro passenger ship**.

Openings in watertight bulkheads below the bulkhead deck for ships with service notation **passenger ship** or **ro-ro passenger ship** are to comply with Part D, Chapter 11 or Part D, Chapter 12, respectively.

**6.1.2** The requirements in [6.2] and [6.3] are not applicable to ships having additional service feature **SPxxx** or **SPxxx-capable** with xxx less than 240.

Openings in watertight bulkheads below the bulkhead deck for ships with additional service feature **SPxxx** or **SPxxx-capable** with xxx less than 240 are to comply with Part D, Chapter 11.

### 6.2 General

**6.2.1** *The number of openings in watertight subdivisions is to be kept to a minimum compatible with the design and proper working of the ship. Where penetrations of watertight bulkheads and internal decks are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity. The Society may permit relaxation in the watertightness of openings above the freeboard deck, provided that it is demonstrated that any progressive flooding can be easily controlled and that the safety of the ship is not impaired.*

**6.2.2** No door, manhole ventilation duct or any other opening is permitted in the collision bulkhead below the subdivision deck.

**6.2.3** Lead or other heat sensitive materials may not be used in systems which penetrate watertight subdivision bulkheads, where deterioration of such systems in the event of fire would impair the watertight integrity of the bulkheads.

**6.2.4** Valves not forming part of a piping system are not permitted in watertight subdivision bulkheads.

**6.2.5** The requirements relevant to the operating systems for doors complying with the provisions in [6.3] are specified in:

- Tab 2 for doors of internal watertight bulkheads, and
- Tab 3 for doors of external watertight boundaries below equilibrium or intermediate waterplane.

**6.2.6** A diagram showing the location of the door and an indication to show its position is to be provided at the central operating console located at the navigation bridge. A red light is to indicate that the door is in the open position and a green light is to indicate that the door is in the closed position. The red light is to flash when the door is in an intermediate position.

**6.2.7** Signboard/instructions are to be placed in way of the door advising how to act when the door is closed.

**6.2.8** For watertight doors, including sliding doors, operated by hydraulic door actuators, either a central hydraulic unit or an independent hydraulic unit for each door is to be provided with a low fluid level alarm or low gas pressure alarm, as applicable or some other means of monitoring loss of stored energy in the hydraulic accumulators. This alarm is to be both audible and visible and is to be located at the navigation bridge.

### 6.3 Openings in the watertight bulkheads and internal decks

#### 6.3.1 Openings used while at sea

*Doors provided to ensure the watertight integrity of internal openings which are used while at sea are to be sliding watertight doors capable of being remotely closed from the bridge and are also to be operable locally from each side of the bulkhead.*

*For cargo ships, the angle of list at which operation by hand is to be possible is 30 degrees.*

Position indicators are to be provided at all remote operating positions for all ships and locally on both sides of the internal doors for cargo ships. An audible alarm is also to be provided at the door closure. The power, control and indicators are to be operable in the event of main power failure. Particular attention is to be paid to minimise the effect of control system failure. Each power-operated sliding watertight door is to be provided with an individual hand-operated mechanism. The possibility of opening and closing the door by hand at the door itself from both sides is to be assured.

Failure of the normal power supply of the required alarms is to be indicated by an audible and visual alarm at the navigation bridge.

**6.3.2 Openings normally closed at sea**

Access doors and access hatch covers normally closed at sea, intended to ensure the watertight integrity of internal openings, are to be provided with position indicators on the bridge for all ships, and locally on both sides of the internal doors for cargo ships, showing whether these doors or hatch covers are open or closed. A notice is to be affixed to each such door or hatch cover to the effect that it is not to be left open.

**6.3.3 Doors or ramps in large cargo spaces**

Watertight doors or ramps of satisfactory construction may be fitted to internally subdivide large cargo spaces, provided that the Society is satisfied that such doors or ramps are essential. These doors or ramps may be hinged, rolling or sliding doors or ramps, but are not to be remotely controlled. Such doors are to be closed before the voyage commences and are to be kept closed during navigation. Should any of the doors or ramps be accessible during the voyage, they are to be fitted with a device which prevents unauthorised opening.

The word “satisfactory” means that scantlings and sealing requirements for such doors or ramps are to be sufficient to withstand the maximum head of the water at the flooded waterline.

**6.3.4 Openings permanently kept closed at sea**

Other closing appliances which are kept permanently closed at sea to ensure the watertight integrity of internal openings are to be provided with a notice which is to be affixed to each such closing appliance to the effect that it is to be kept closed. Manholes fitted with closely bolted covers need not be so marked.

**Table 2 : Doors in internal watertight bulkheads of cargo ships**

Position relative to freeboard deck	Frequency of use while at sea	Type (1)	Remote closure	Remote indication	Audible or visual alarm	Notice
Below	Used	POS	X	X	X (local)	
	Normally closed (2)	S, H		X		X
	Permanently closed (3)	S, H				X
At or above	Used (4) (5)	POS	X	X	X (local)	
	Normally closed (2)	S, H		X		X
	Permanently closed (3)	S, H				X

(1) POS : Power operated, sliding or rolling  
 S : Sliding or rolling  
 H : Hinged  
 (2) If hinged, this door is to be of single action type.  
 (3) Doors are to be fitted with a device which prevents unauthorized opening.  
 (4) According to Ch 3, App 4, [3], doors separating a main machinery space from a steering gear compartment may be hinged single action type provided the lower sill of such doors is above the summer load line and the doors remain closed at sea whilst not in use.  
 (5) Under MARPOL, hinged watertight doors may be acceptable in watertight bulkhead in the superstructure.

**Table 3 : Doors in external watertight boundaries below equilibrium or intermediate waterplane of cargo ships**

Position relative to freeboard deck	Frequency of use while at sea	Type (1)	Remote closure	Remote indication	Audible or visual alarm	Notice
Below	Permanently closed (2)	S, H		X		X
At or above	Normally closed (3)	S, H		X		X
	Permanently closed (2)	S, H		X		X

(1) POS : Power operated, sliding or rolling  
 S : Sliding or rolling  
 H : Hinged  
 (2) Doors are to be fitted with a device which prevents unauthorized opening.  
 (3) If hinged, this door is to be of single action type.

# Section 2                      Compartment Arrangement

## 1 General

### 1.1 Application to ships having additional service feature SPxxx or SPxxx-capable

**1.1.1** Ships having additional service feature **SPxxx** or **SPxxx-capable** with xxx equal to or greater than 240 are to comply, in addition of the applicable requirements of this Section with the requirements of Pt D, Ch 11, Sec 2, considering the special personnel as passengers.

**1.1.2** Ships having additional service feature **SPxxx** or **SPxxx-capable** with xxx less than 240 are to comply with the requirements of this Section, unless otherwise specified, considering the special personnel as crew.

### 1.2 Definitions

#### 1.2.1 Cofferdam

A cofferdam means an empty space arranged so that compartments on each side have no common boundary; a cofferdam may be located vertically or horizontally. As a rule, a cofferdam is to be properly ventilated and of sufficient size to allow for inspection.

## 2 Cofferdams

### 2.1 Cofferdam arrangement

**2.1.1** Cofferdams are to be provided between:

- fuel oil tanks and lubricating oil tanks
- compartments intended for liquid hydrocarbons (fuel oil, lubricating oil) and compartments intended for fresh water (drinking water, water for propelling machinery and boilers, water for fire-fighting purposes)
- compartments intended for liquid hydrocarbons (fuel oil, lubricating oil) and tanks intended for the carriage of liquid foam for fire extinguishing.

**2.1.2** Cofferdams separating:

- fuel oil tanks and lubricating oil tanks
- lubricating oil tanks from compartments intended for fresh water
- lubricating oil tanks from those intended for the carriage of liquid foam for fire extinguishing
- fuel oil tanks from tanks intended for the carriage of liquid foam for fire extinguishing on ships having the service notation **fire-fighting**

need not to be required when agreed by the Society in relation to the characteristics and dimensions of the spaces containing such tanks, provided that:

- the thickness of common boundary plates of adjacent tanks is increased, with respect to the thickness obtained according to Ch 7, Sec 4, by 2 mm in the case of tanks carrying fresh water or boiler feed water, and by 1 mm in all other cases
- the sum of the throats of the weld fillets at the edges of these plates is not less than the thickness of the plates themselves
- the structural test is carried out with a head increased by 1 m with respect to Ch 13, Sec 6, [1.4].

**2.1.3** Vented cofferdam may be required to separate heated oil fuel tanks from enclosed spaces located directly above (see Pt C, Ch 1, Sec 10, [11.7.2], item a)).

## 3 Double bottoms

### 3.1 Double bottom arrangement for ships other than tankers

**3.1.1** A double bottom is to be fitted extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

**3.1.2** Where a double bottom is required to be fitted, the inner bottom is to be continued out to the ship's sides in such a manner as to protect the bottom to the turn of the bilge. Such protection is to be deemed satisfactory if the inner bottom is not lower at any part than a plane parallel with the keel line and which is located not less than a vertical distance  $h$  measured from the keel line, as calculated by the formula:

$$h = B/20$$

However, in no case is the value of  $h$  to be less than 760 mm, and need not to be taken as more than 2 m.

**3.1.3** Small wells constructed in the double bottom in connection with drainage arrangement are not to extend downward more than necessary. The vertical distance from the bottom of such a well to a plane coinciding with the keel line is not to be less than  $h/2$  or 500 mm, whichever is greater, or compliance with requirement defined in Ch 3, Sec 3, [3.4.3] is to be shown for that part of the ship.

Other wells (e.g. for lubricating oil under main engines) may be permitted by the Society if satisfied that the arrangements give protection equivalent to that afforded by a double bottom complying with this regulation.

Proof of equivalent protection is to be shown by demonstrating that the ship is capable of withstanding bottom damages as specified in Ch 3, Sec 3, [3.4.3]. Alternatively, wells for lubricating oil below main engines may protrude into the double bottom below the boundary line defined by the distance  $h$  provided that the vertical distance between the well bottom and a plane coinciding with the keel line is not less than  $h/2$  or 500 mm, whichever is the greater.

For a cargo ship of less than 80 m in length, the arrangements are to provide a level of safety to the satisfaction of the Society.

**3.1.4** A double bottom need not be fitted in way of watertight tanks, including dry tanks of moderate size, provided the safety of the ship is not impaired in the event of bottom or side damage as defined in Ch 3, Sec 3, [3.4].

**3.1.5** Any part of a ship that is not fitted with a double bottom in accordance with [3.1.1] or [3.1.4] is to be capable of withstanding bottom damages, as specified in Ch 3, Sec 3, [3.4.3]. For cargo ships of less than 80 m in length, the alternative arrangements are to provide a level of safety to the satisfaction of the Society.

**3.1.6** In the case of unusual bottom arrangements, it is to be demonstrated that the ship is capable of withstanding bottom damages as specified in Ch 3, Sec 3, [3.4.3]. For cargo ships of less than 80 m in length, the alternative arrangements are to provide a level of safety to the satisfaction of the Society.

## **4 Compartments forward of the collision bulkhead**

### **4.1 General**

**4.1.1** The fore peak and other compartments located forward of the collision bulkhead are not to be used for the carriage of fuel oil or other flammable products.

This requirement does not apply to ships of less than 400 gross tonnage, except for those where the fore peak is the forward cofferdam of tanks arranged for the carriage of flammable liquid products having a flashpoint not exceeding 60°C.

## **5 Minimum bow height**

### **5.1 General**

**5.1.1** The bow height  $F_b$  defined as the vertical distance at the forward perpendicular between the waterline corresponding to the assigned summer freeboard and the designed trim and the top of the exposed deck at side, is to be not less than:

$$F_b = [6075(L_{LL}/100) - 1875(L_{LL}/100)^2 + 200(L_{LL}/100)^3] \times [2,08 + 0,609C_b - 1,603C_{wf} - 0,0129(L_{LL}/T_1)]$$

where:

$F_b$  : Calculated minimum bow height, in mm

$T_1$  : Draught at 85% of the least moulded depth, in m, as defined in Ch 1, Sec 3, [2.1.6]

$C_{wf}$  : Waterplane area coefficient forward of  $L_{LL}/2$ :

$$C_{wf} = \frac{A_{wf}}{L_{LL}B}$$

$A_{wf}$  : Waterplane area forward of  $L_{LL}/2$  at draught  $T_1$ , in m<sup>2</sup>.

For ships to which timber freeboards are assigned, the summer freeboard (and not the timber summer freeboard) is to be assumed when applying the formula above.

**5.1.2** Where the bow height required in [5.1.1] is obtained by sheer, the sheer is to extend for at least 15% of  $L_{LL}$  of the ship measured from the forward perpendicular. Where it is obtained by fitting a superstructure, such superstructure is to extend from the stem to a point at least  $0,07L_{LL}$  abaft the forward perpendicular and is to be enclosed as defined in Ch 11, Sec 5.

**5.1.3** Ships which, to suit exceptional operational requirements, cannot meet the requirements in [5.1.1] and [5.1.2] will be considered by the Society on a case by case basis.

**5.1.4** The sheer of the forecastle deck may be taken into account, even if the length of the forecastle is less than  $0,15L_{LL}$ , but greater than  $0,07L_{LL}$ , provided that the forecastle height is not less than one half of standard height of superstructure between  $0,07L_{LL}$  and the forward perpendicular.

**5.1.5** Where the forecastle height is less than one half of the standard height of superstructure, the credited bow height may be determined as follows:

- a) Where the freeboard deck has sheer extending from abaft  $0,15L_{LL}$  by a parabolic curve having its origin at  $0,15L_{LL}$  abaft the forward perpendicular at a height equal to the midship depth of the ship, extended through the point of intersection of forecastle bulkhead and deck, and up to a point at the forward perpendicular not higher than the level of the forecastle deck (see Fig 1). However, if the value of the height denoted  $h_t$  in Fig 1 is smaller than the value of the height denoted  $h_b$  then  $h_t$  may be replaced by  $h_b$  in the available bow height, where:

$$h_t = Z_b \left( \frac{0,15L_{LL}}{x_b} \right)^2 - Z_t$$

$Z_b, Z_t$  : As defined in Fig 1

$h_f$  : Half standard height of superstructure.

- b) Where the freeboard deck has sheer extending for less than  $0,15L_{LL}$  or has no sheer, by a line from the forecastle deck at side at  $0,07L_{LL}$  extended parallel to the base line to the forward perpendicular (see Fig 2).

**Figure 1 : Credited bow height where the freeboard deck has sheer extending from abaft  $0,15 L$**

**Figure 2 : Credited bow height where the freeboard deck has sheer extending for less than  $0,15 L$**

**5.1.6** All ships assigned a type B freeboard, other than oil tankers, chemical tankers and gas carriers, are to have additional reserve buoyancy in the fore end. Within the range of  $0,15L_{LL}$  abaft of the forward perpendicular, the sum of the projected area between the summer load waterline and the deck at side (A1 and A2 in Fig 3) and the projected area of an enclosed superstructure, if fitted, is, in  $m^2$ , to be not less than:

$$A3 = (0,15 F_{min} + 4 (L_{LL}/3 + 10)) L_{LL}/1000$$

where:

$$F_{min} : F_{min} = (F_0 \cdot f_1) + f_2$$

$F_0$  : Tabular freeboard, in mm, taken from the International Convention on Load Lines, as amended, Table 28.2, corrected for regulation 27(9) or 27(10), as applicable

$f_1$  : Correction for block coefficient given in the International Convention on Load Lines, as amended, regulation 30

$f_2$  : Correction for depth, in mm, given in the International Convention on Load Lines, as amended, regulation 31.

**Figure 3 : Areas A1, A2 and A3**

## 6 Shaft tunnels

### 6.1 General

**6.1.1** Shaft tunnels are to be watertight.

## 7 Watertight ventilators and trunks

### 7.1 General

**7.1.1** Watertight ventilators and trunks are to be carried at least up to the bulkhead deck in passenger ships and up to the freeboard deck in ships other than passenger ships.

## 8 Fuel oil tanks

### 8.1 General

**8.1.1** The arrangements for the storage, distribution and utilisation of the fuel oil are to be such as to ensure the safety of the ship and persons on board.

**8.1.2** As far as practicable, fuel oil tanks are to be part of the ship's structure and are to be located outside machinery spaces of category A.

Where fuel oil tanks, other than double bottom tanks, are necessarily located adjacent to or within machinery spaces of category A, at least one of their vertical sides is to be contiguous to the machinery space boundaries, they are preferably to have a common boundary with the double bottom tanks and the area of the tank boundary common with the machinery spaces is to be kept to a minimum.

Where such tanks are situated within the boundaries of machinery spaces of category A, they may not contain fuel oil having a flashpoint of less than 60°C.

Note 1: Machinery spaces of category A are defined in Pt C, Ch 4, Sec 1, [2.29].

**8.1.3** Fuel oil tanks may not be located where spillage or leakage therefrom can constitute a hazard by falling on heated surfaces. Precautions are to be taken to prevent any oil that may escape under pressure from any pump, filter or heater from coming into contact with heated surfaces.

Fuel oil tanks in boiler spaces may not be located immediately above the boilers or in areas subjected to high temperatures, unless special arrangements are provided in agreement with the Society.

**8.1.4** Where a compartment intended for goods or coal is situated in proximity of a heated liquid container, suitable thermal insulation is to be provided.

### 8.2 Fuel oil tank protection

**8.2.1** All ships with an aggregate oil fuel capacity of 600 m<sup>3</sup> are to comply with the requirements of the Regulation 12 A of Annex I to Marpol Convention, as amended.

## 9 Tanks containing fuel for auxiliary vehicles

### 9.1 General

**9.1.1** Tanks containing fuel for auxiliary vehicles are to comply with the requirements of Pt C, Ch 4, Sec 11, [3.1].

### 9.2 Tank protection and segregation

**9.2.1** Tanks containing fuel for auxiliary vehicles are to be located in accordance with the requirements of Pt C, Ch 4, Sec 11, [3.2].

## 10 Tanks containing chemical treatment fluids for exhaust gas pollution prevention system

### 10.1 Tank protection and segregation

**10.1.1** Tanks containing chemical treatment fluids for exhaust gas pollution prevention system are to comply with requirements of:

- Pt C, Ch 1, Sec 11, [3.2] for tank containing urea
- Pt C, Ch 1, Sec 11, [4.2] for tank containing sodium hydroxide (NaOH) or calcium hydroxide (Ca(OH)<sub>2</sub>)
- Pt C, Ch 1, Sec 11, [4.8] for tank residues
- Pt C, Ch 1, Sec 11, [5.4] for tanks containing other chemicals.

## 11 Tanks containing solvent for onboard carbon capture systems (ships assigned the additional service feature OCC)

### 11.1 Tank protection and segregation

**11.1.1** Tanks containing solvent (as defined in Pt C, Ch 1, Sec 12, [1.3.6]) for OCC are to comply with the requirements of Pt C, Ch 1, Sec 12, [2.4.4].

## Section 3 Access Arrangement

### 1 General

#### 1.1

1.1.1 The number and size of small hatchways for trimming and access openings to tanks or other enclosed spaces, are to be kept to the minimum consistent with access and maintenance of the space.

### 2 Double bottom

#### 2.1 Inner bottom manholes

2.1.1 Inner bottom manholes are to be not less than 400 mm x 400 mm. Their number and location are to be so arranged as to provide convenient access to any part of the double bottom.

2.1.2 Inner bottom manholes are to be closed by watertight plate covers. Doubling plates are to be fitted on the covers, where secured by bolts.

Where no ceiling is fitted, covers are to be adequately protected from damage by the cargo.

#### 2.2 Floor and girder manholes

2.2.1 Manholes are to be provided in floors and girders so as to provide convenient access to all parts of the double bottom.

2.2.2 The size of manholes and lightening holes in floors and girders is, in general, to be less than 50 per cent of the local height of the double bottom.

Where manholes of greater sizes are needed, edge reinforcement by means of flat bar rings or other suitable stiffeners may be required.

2.2.3 Manholes may not be cut into the continuous centreline girder or floors and girders below pillars, except where allowed by the Society on a case by case basis.

### 3 Access arrangement to and within spaces in, and forward of, the cargo area

#### 3.1 General

3.1.1 The requirements in [3.2] to [3.4] are not applicable to ships with service notations **bulk carrier**, **bulk carrier CSR ESP**, **bulk carrier CSR BC-A ESP**, **bulk carrier CSR BC-B ESP**, **bulk carrier CSR BC-C ESP**, **self-unloading bulk carrier ESP**, **ore carrier ESP**, **combination carrier ESP**, of 20,000 gross tonnage and over, and to ships with service notation **oil tanker ESP** of 500 gross tonnage and over. For such ships, refer to the applicable requirements of Part D.

3.1.2 The requirements in [3.2] to [3.4] are not applicable to spaces in double bottom and double side tanks.

#### 3.2 Access to tanks

##### 3.2.1 Tanks with a length equal to or greater than 35 m

*Tanks and subdivisions of tanks having lengths of 35 m and above are to be fitted with at least two access hatchways and ladders, as far apart as practicable longitudinally.*

##### 3.2.2 Tanks with a length less than 35 m

*Tanks less than 35 m in length are to be served by at least one access hatchway and ladder.*

##### 3.2.3 Dimensions of access hatchways

*The dimensions of any access hatchway are to be sufficient to allow a person wearing a self-contained breathing apparatus to ascend or descend the ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the tank. In no case is the clear opening to be less than 600 mm x 600 mm.*

##### 3.2.4 Tanks subdivided by wash bulkheads

*When a tank is subdivided by one or more wash bulkheads, at least two hatchways are to be fitted, and these hatchways are to be so located that the associated ladders effectively serve all subdivisions of the tank.*

### **3.3 Access within tanks**

#### **3.3.1 Wash bulkheads in tanks**

Where one or more wash bulkheads are fitted in a tank, they are to be provided with openings not less than 600 x 800 mm and so arranged as to facilitate the access of persons wearing breathing apparatus or carrying a stretcher with a patient.

#### **3.3.2 Passage on the tank bottom**

To provide ease of movement on the tank bottom throughout the length and breadth of the tank, a passageway is to be fitted on the upper part of the bottom structure of each tank, or alternatively, manholes having at least the dimensions of 600 mm x 800 mm are to be arranged in the floors at a height of not more than 600 mm from the bottom shell plating.

#### **3.3.3 Passageways in the tanks**

- a) Passageways in the tanks are to have a minimum width of 600 mm considering the requirement for the possibility of carrying an unconscious person. Elevated passageways are to be provided with guard rails over their entire length. Where guard rails are provided on one side only, foot rails are to be fitted on the opposite side. Shelves and platforms forming a part of the access to the tanks are to be of non-skid construction where practicable and be fitted with guard rails. Guard rails are to be fitted to bulkhead and side stringers when such structures are being used for recognised access
- b) Access to elevated passageways from the ship's bottom is to be provided by means of easily accessible passageways, ladders or treads. Treads are to provide lateral support for the foot. Where rungs of ladders are fitted against a vertical surface, the distance from the centre of the rungs to that surface is to be at least 150 mm
- c) When the height of the bottom structure does not exceed 1,50 m, the passageways required in a) may be replaced by alternative arrangements having regard to the bottom structure and requirement for ease of access of a person wearing a self-contained breathing apparatus or carrying a stretcher with a patient.

#### **3.3.4 Manholes**

Where manholes are fitted, as indicated in [2.2.2], access is to be facilitated by means of steps and hand grips with platform landings on each side.

#### **3.3.5 Guard rails**

Guard rails are to be 900 mm in height and consist of a rail and intermediate bar. These guard rails are to be of substantial construction.

### **3.4 Construction of ladders**

#### **3.4.1 General**

In general, the ladders are not to be inclined at an angle exceeding 70°. The flights of ladders are not to be more than 9 m in actual length. Resting platforms of adequate dimensions are to be provided.

#### **3.4.2 Construction**

Ladders and handrails are to be constructed of steel of adequate strength and stiffness and securely attached to the tank structure by stays. The method of support and length of stay are to be such that vibration is reduced to a practical minimum.

#### **3.4.3 Corrosive effect of the cargo**

Provision is to be made for maintaining the structural strength of the ladders and railings taking into account the corrosive effect of the cargo.

#### **3.4.4 Width of ladders**

The width of ladders is not to be less than:

- 350 mm for vertical ladders
- 400 mm for inclined ladders.

#### **3.4.5 Treads**

The treads are to be equally spaced at a distance apart measured vertically not exceeding 300 mm. They are to be formed of two square steel bars of not less than 22 mm by 22 mm in section fitted to form a horizontal step with the edges pointing upward, or of equivalent construction. The treads are to be carried through the side stringers and attached thereto by double continuous welding.

#### **3.4.6 Sloping ladders**

All sloping ladders are to be provided with handrails of substantial construction on both sides fitted at a convenient distance above the treads.

## **4 Shaft tunnels**

### **4.1 General**

**4.1.1** Tunnels are to be large enough to ensure easy access to shafting.

**4.1.2** Access to the tunnel is to be provided by a watertight door fitted on the aft bulkhead of the engine room in compliance with Ch 2, Sec 1, [6].

## **5 Access to steering gear compartment**

### **5.1**

**5.1.1** The steering gear compartment is to be readily accessible and, as far as practicable, separated from machinery spaces.

**5.1.2** Suitable arrangements to ensure working access to steering gear machinery and controls are to be provided. These arrangements are to include handrails and gratings or other non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage.

# Part B

## Hull and Stability

---

### CHAPTER 3

### STABILITY

---

Section 1	General
Section 2	Intact Stability
Section 3	Damage Stability
Appendix 1	Inclining Test and Lightweight Check
Appendix 2	Trim and Stability Booklet
Appendix 3	Probabilistic Damage Stability Method for Cargo Ships
Appendix 4	Damage Stability Calculation for Ships Assigned with a Reduced Freeboard

# Section 1 General

## 1 General

### 1.1 Application

#### 1.1.1 General

All ships equal to or greater than 24 m in length may be assigned class only after it has been demonstrated that their intact stability is adequate. Adequate intact stability means compliance with standards laid down by the relevant Administration or with the requirements specified in this Chapter taking into account the ship's size and type. In any case, the level of intact stability is not to be less than that provided by the Rules.

#### 1.1.2 Ships less than 24 m in length

The Rules also apply to ships less than 24 m in length. In this case, the requirements concerned may be partially omitted when deemed appropriate by the Society.

#### 1.1.3 Approval of the Administration

Evidence of approval by the Administration concerned may be accepted for the purpose of classification.

### 1.2 Application to ships having additional service feature SPxxx or SPxxx-capable

**1.2.1** Ships having additional service feature **SPxxx** or **SPxxx-capable** with xxx equal to or greater than 240 are to comply, in addition to the applicable requirements of this Chapter, with the requirements of Pt D, Ch 11, Sec 3, considering the special personnel as passengers.

**1.2.2** Ships having additional service feature **SPxxx** or **SPxxx-capable** with xxx less than 240 are to comply with the requirements of this Chapter, unless otherwise specified, considering the special personnel as crew.

### 1.3 Application to ships having additional class notation STABLIFT

**1.3.1** Ships having additional class notation **STABLIFT** are to comply, in addition to the applicable requirements of this Chapter, with the requirements of Pt E, Ch 8, Sec 3.

### 1.4 Alterations

**1.4.1** When alterations are made to a ship in service that result in calculable differences in the lightship properties, a detailed weights and centres of gravity calculation to adjust the lightship properties is to be carried out.

The ship is to be re-inclined if any of the following deviations from the approved values are exceeded:

- 2% of the lightship displacement; or
- 1% of L for the longitudinal centre of gravity; or
- 1% of the vertical centre of gravity.

The lightship transverse centre of gravity is not subject to a deviation limit.

**1.4.2** When a ship does not exceed the deviation limits specified in [1.4.1], amended stability information should be provided to the master using the new calculated lightship properties if any of the following deviations from the approved values are exceeded:

- 1% of the lightship displacement; or
- 0,5% of L for the longitudinal centre of gravity; or
- 0,5% of the vertical centre of gravity.

However, in cases when these deviation limits are not exceeded, it is not necessary to amend the stability information supplied to the master.

## **2 Examination procedure**

### **2.1 Documents to be submitted**

#### **2.1.1 List of documents**

For the purpose of the examination of the stability, the documentation listed in Ch 1, Sec 4, [1.1.2] is to be submitted for information.

The stability documentation to be submitted for approval, as indicated in Ch 1, Sec 4, [1.2.1], is as follows:

- inclining test report for the ship, as required in [2.2] or:
  - where the stability data is based on a sister ship, the inclining test report of that sister ship along with the lightship measurement report for the ship in question; or
  - where lightship particulars are determined by methods other than inclining of the ship or its sister, the lightship measurement report of the ship along with a summary of the method used to determine those particulars as indicated in [2.2.4].
- trim and stability booklet, as required in Ch 3, Sec 2, [1.1.1]
- and, as applicable:
  - grain loading manual, as required in Pt D, Ch 4, Sec 3, [1.2.2]
  - damage stability calculations, as required in Ch 3, Sec 3, [3.1]
  - damage control documentation, as required in Ch 3, Sec 3, [4]
  - loading computer documentation, as required in Ch 3, Sec 2, [1.1.2] and in Ch 3, Sec 3, [3.1.3].

A copy of the trim and stability booklet and, if applicable, the grain stability booklet, the damage control documentation or the loading computer documentation is to be available on board for the attention of the Master.

#### **2.1.2 Provisional documentation**

The Society reserves the right to accept or demand the submission of provisional stability documentation for examination.

Provisional stability documentation includes loading conditions based on estimated lightship values.

#### **2.1.3 Final documentation**

Final stability documentation based on the results of the inclining test or the lightweight check is to be submitted for examination.

When provisional stability documentation has already been submitted and the difference between the estimated values of the lightship and those obtained after completion of the test is less than:

- 2% for the displacement, and
- 1% of the length between perpendiculars for the longitudinal position of the centre of gravity

and the determined vertical position of the centre of gravity is not greater than the estimated vertical position of the centre of gravity, the provisional stability documentation may be accepted as the final stability documentation.

## **2.2 Inclining test/lightweight check**

### **2.2.1 Definitions**

#### **a) Lightship**

*The lightship is a ship complete in all respects, but without consumables, stores, cargo, and crew and effects, and without any liquids on board except for machinery and piping fluids, such as lubricants and hydraulics, at operating levels, and mediums required for the fixed fire-extinguishing systems, such as fresh water, CO<sub>2</sub>, dry chemical powder, foam concentrate, etc.*

#### **b) Inclining test**

The inclining test is a procedure which involves moving a series of known weights, normally in the transverse direction, and then measuring the resulting change in the equilibrium heel angle of the ship. By using this information and applying basic naval architecture principles, the ship's vertical centre of gravity (VCG or KG) is determined.

#### **c) Lightweight check**

The lightweight check is a procedure which involves auditing all items which are to be added, deducted or relocated on the ship at the time of the inclining test so that the observed condition of the ship can be adjusted to the lightship condition. The weight and longitudinal, transverse and vertical location of each item are to be accurately determined and recorded. The lightship displacement and longitudinal centre of gravity (LCG) can be obtained using this information, as well as the static waterline of the ship at the time of the inclining test as determined by measuring the freeboard or verified draught marks of the ship, the ship's hydrostatic data and the sea water density.

### 2.2.2 General

Any ship for which a stability investigation is requested in order to comply with class requirements is to be initially subjected to an inclining test permitting the evaluation of the position of the lightship centre of gravity, or a lightweight check of the lightship displacement, so that the stability data can be determined. Cases for which the inclining test is required and those for which the lightweight check is accepted in its place are listed in [2.2.4] and [2.2.5].

A detailed procedure of the test is to be submitted to the Society prior to the test. This procedure is to include:

- a) *Identification of the ship by name and shipyard hull number, if applicable*
- b) *Date, time and location of the test*
- c) *Inclining weight data:*
  - *type*
  - *amount (number of units and weight of each)*
  - *certification*
  - *method of handling (i.e. sliding rail or crane)*
  - *anticipated maximum angle of heel to each side*
- d) *Measuring devices:*
  - *pendulums - approximate location and length*
  - *U-tubes - approximate location and length*
  - *inclinometers - Location and details of approvals and calibrations*
- e) *Approximate trim*
- f) *Condition of tanks*
- g) *Estimate weights to deduct, to complete, and to relocate in order to place the ship in its true lightship condition.*

The inclining test or lightweight check is to be attended by a Surveyor of the Society. The Society may accept inclining tests or lightweight checks attended by a member of the flag Administration.

The inclining test is adaptable to ships less than 24 m in length, provided that precautions are taken, on a case by case basis, to ensure the accuracy of the test procedure.

The inclining test or lightweight test report is to be signed by the Surveyor to confirm the information witnessed during the test. In addition, for ships performing regular adjustments of equipment such as for example supply vessels, the report is to include the detailed list of the major equipment on the decks, if they are included in the lightship particulars.

### 2.2.3 Inclining test

The inclining test is required in the following cases:

- any new ship, after its completion, except for the cases specified in [2.2.4]
- any ship, where any alterations are made so as to materially affect the stability (see [1.4]).

Note 1: Due attention is to be paid to SOLAS Ch.II.1 Reg.22 (if applicable) whereby it is stipulated that such allowance is subject to the Flag Authorities agreement (refer to Pt A, Ch 1, Sec 1, [3.1.1]).

### 2.2.4 Lightweight check

The Society may allow a lightweight check to be carried out in lieu of an inclining test in the case of:

- *Stability data are available from the inclining test of a sister ship and it is shown to the satisfaction of the Society that reliable stability information for the exempted ship can be obtained from such basic data. A lightweight survey shall be carried out upon completion and the ship shall be inclined whenever in comparison with the data derived from the sister ship, a deviation from the lightship displacement exceeding 1% for ships of 160 m or more in length and 2% for ships of 50 m or less in length and as determined by linear interpolation for intermediate lengths or a deviation from the lightship longitudinal centre of gravity exceeding 0.5% of  $L_{LL}$  is found.*
- Special types of ship, such as pontoons, provided that the vertical centre of gravity is considered at the level of the deck.
- Special types of ship provided that:
  - a detailed list of weights and the positions of their centres of gravity is submitted
  - a lightweight check is carried out, showing accordance between the estimated values and those determined
  - adequate stability is demonstrated in all the loading conditions reported in the trim and stability booklet.

### 2.2.5 Detailed procedure

A detailed procedure for conducting an inclining test is included in Ch 3, App 1. For the lightweight check, the same procedure applies except as provided for in Ch 3, App 1, [1.1.9].

## Section 2 Intact Stability

### 1 General

#### 1.1 Information for the Master

##### 1.1.1 Stability booklet

Each ship is to be provided with a stability booklet, approved by the Society, which contains sufficient information to enable the Master to operate the ship in compliance with the applicable requirements contained in this Section.

Where any alterations are made to a ship so as to materially affect the stability information supplied to the Master, amended stability information is to be provided. If necessary the ship is to be re-inclined.

Stability data and associated plans are to be drawn up in the working language of the ship and any other language the Society may require. reference is also made to the International Safety Management (ISM) Code, adopted by IMO by resolution A.741(18). All translations of the stability booklet are to be approved.

The format of the trim and stability booklet and the information included are specified in Ch 3, App 2.

##### 1.1.2 Loading instrument

As a supplement to the approved stability booklet, a loading instrument, approved by the Society, may be used to facilitate the stability calculations mentioned in Ch 3, App 2.

A simple and straightforward instruction manual is to be provided.

In order to validate the proper functioning of the computer hardware and software, pre-defined loading conditions are to be run in the loading instrument periodically, at least at every periodical class survey, and the print-out is to be maintained on board as check conditions for future reference in addition to the approved test conditions booklet.

The procedure to be followed, as well as the list of technical details to be sent in order to obtain loading instrument approval, are given in Ch 1, Sec 5, [3].

##### 1.1.3 Operating booklets for certain ships

Ships with innovative design are to be provided with additional information in the stability booklet such as design limitations, maximum speed, worst intended weather conditions or other information regarding the handling of the craft that the Master needs to operate the ship.

#### 1.2 Permanent ballast

1.2.1 If used, permanent ballast is to be located in accordance with a plan approved by the Society and in a manner that prevents shifting of position. Permanent ballast is not to be removed from the ship or relocated within the ship without the approval of the Society. Permanent ballast particulars are to be noted in the ship's stability booklet.

1.2.2 Permanent solid ballast is to be installed under the supervision of the Society.

### 2 Design criteria

#### 2.1 General intact stability criteria

##### 2.1.1 General

The intact stability criteria specified in [2.1.2], [2.1.3], [2.1.4], and [2.1.5] are to be complied with for the loading conditions mentioned in Ch 3, App 2, [1.2].

However, the lightship condition not being an operational loading case, the Society may accept that part of the above-mentioned criteria are not fulfilled.

*These criteria set minimum values, but no maximum values are recommended. It is advisable to avoid excessive values of metacentric height, since these might lead to acceleration forces which could be prejudicial to the ship, its equipment and to safe carriage of the cargo.*

##### 2.1.2 GZ curve area

The area under the righting lever curve (GZ curve) is to be not less than 0,055 m-rad up to  $\theta = 30^\circ$  angle of heel and not less than 0,09 m-rad up to  $\theta = 40^\circ$  or the angle of down flooding  $\theta_f$  if this angle is less than  $40^\circ$ . Additionally, the area under the righting lever curve (GZ curve) between the angles of heel of  $30^\circ$  and  $40^\circ$  or between  $30^\circ$  and  $\theta_f$ , if this angle is less than  $40^\circ$ , is to be not less than 0,03 m-rad.

Note 1: Note 1:  $\theta_f$  is an angle of heel at which openings in the hull, superstructures or deckhouses which cannot be closed weathertight submerge.

In applying this criterion, openings which cannot be closed weathertight include ventilators that have to remain open to supply air to the engine room, to the emergency generator room or to closed ro-ro and vehicle spaces for the effective operation of the ship, but exclude small openings through which progressive flooding cannot take place. This interpretation is not intended to be applied to existing ships.

The means of closing air pipes are to be weathertight and of an automatic type if the openings of the air pipes to which the devices are fitted would be submerged at an angle of less than 40 degrees (or any lesser angle which may be needed to suit stability requirements) when the ship is floating at its summer load line draught. Pressure/vacuum valves (P.V. valves) may be accepted on tankers. Wooden plugs and trailing canvas hoses may not be accepted in positions 1 and 2 as defined in Ch 1, Sec 3, [2.4].

### 2.1.3 Minimum righting lever

The righting lever  $GZ$  is to be at least 0,20 m at an angle of heel equal to or greater than 30°.

### 2.1.4 Angle of maximum righting lever

The maximum righting arm is to occur at an angle of heel preferably exceeding 30° but not less than 25°.

When the righting lever curve has a shape with two maximums, the first is to be located at a heel angle not less than 25°.

In cases of ships with a particular design and subject to the prior agreement of the flag Administration, the Society may accept an angle of heel  $\theta_{max}$  less than 25° but in no case less than 15°, provided that the area "A" below the righting lever curve up to the angle of  $\theta_{max}$  is not less than the value obtained, in m.rad, from the following formula:

$$A = 0,055 + 0,001 (30^\circ - \theta_{max})$$

where  $\theta_{max}$  is the angle of heel in degrees at which the righting lever curve reaches its maximum.

### 2.1.5 Initial metacentric height

The initial metacentric height  $GM_0$  is not to be less than 0,15 m.

### 2.1.6 Elements affecting stability

A number of influences such as beam wind on ships with large windage area, icing of topsides, water trapped on deck, rolling characteristics, following seas, etc., which adversely affect stability, are to be taken into account.

### 2.1.7 Elements reducing stability

Provisions are to be made for a safe margin of stability at all stages of the voyage, regard being given to additions of weight, such as those due to absorption of water and icing (details regarding ice accretion are given in [6]) and to losses of weight such as those due to consumption of fuel and stores.

## 3 Severe wind and rolling criterion (weather criterion)

### 3.1 Scope

3.1.1 This criterion supplements the stability criteria given in [2.1] for ships of 24 m in length and over. The more stringent criteria of [2.1] and the weather criterion are to govern the minimum requirements.

### 3.2 Weather criterion

#### 3.2.1 Assumptions

The ability of a ship to withstand the combined effects of beam wind and rolling is to be demonstrated for each standard condition of loading, with reference to Fig 1 as follows:

- the ship is subjected to a steady wind pressure acting perpendicular to the ship's centreline which results in a steady wind heeling lever ( $\ell_{w1}$ )
- from the resultant angle of equilibrium ( $\theta_0$ ), the ship is assumed to roll owing to wave action to an angle of roll ( $\theta_1$ ) to windward
- the ship is then subjected to a gust wind pressure which results in a gust wind heeling lever ( $\ell_{w2}$ )
- free surface effects, as described in [4], are to be accounted for in the standard conditions of loading as set out in Ch 3, App 2, [1.2].

#### 3.2.2 Criteria

Under the assumptions of [3.2.1], the following criteria are to be complied with:

- the area "b" is to be equal to or greater than area "a", where:
  - a : Area above the  $GZ$  curve and below  $\ell_{w2}$ , between  $\theta_R$  and the intersection of  $\ell_{w2}$  with the  $GZ$  curve
  - b : Area above the heeling lever  $\ell_{w2}$  and below the  $GZ$  curve, between the intersection of  $\ell_{w2}$  with the  $GZ$  curve and  $\theta_2$
- the angle of heel under action of steady wind ( $\theta_0$ ) is to be limited to 16° or 80% of the angle of deck edge immersion, whichever is less.

Figure 1 : Severe wind and rolling

### 3.2.3 Heeling levers

The wind heeling levers  $l_{w1}$  and  $l_{w2}$ , in m, referred to in [3.2.2], are constant values at all angles of inclination and are to be calculated as follows:

$$l_{w1} = \frac{PAZ}{1000g\Delta}$$

and

$$l_{w2} = 1,5 l_{w1}$$

where:

- $P$  : 504 N/m<sup>2</sup> for unrestricted navigation notation. The value of  $P$  used for ships with restricted navigation notation may be reduced subject to the approval of the Society
  - $A$  : Projected lateral area in m<sup>2</sup>, of the portion of the ship and deck cargo above the waterline
  - $Z$  : Vertical distance in m, from the centre of  $A$  to the centre of the underwater lateral area or approximately to a point at one half the draught
  - $\Delta$  : Displacement in t
- $g = 9,81 \text{ m/s}^2$ .

### 3.2.4 Angles of heel

For the purpose of calculating the criteria of [3.2.2], the angles in Fig 1 are defined as follows:

- $\theta_0$  : Angle of heel, in degrees, under action of steady wind
  - $\theta_1$  : Angle of roll, in degrees, to windward due to wave action, calculated as follows:
 
$$\theta_1 = 109kX_1X_2\sqrt{rs}$$
  - $\theta_2$  : Angle of downflooding ( $\theta_f$ ) in degrees, or 50° or  $\theta_c$ , whichever is less
  - $\theta_f$  : Angle of heel in degrees, at which openings in the hull, superstructures or deckhouses which cannot be closed weathertight immerse. In applying this criterion, openings which cannot be closed weathertight include ventilators that have to remain open to supply air to the engine room or emergency generator room for the effective operation of the ship, but exclude small openings through which progressive flooding cannot take place.
  - $\theta_c$  : Angle in degrees, of second intercept between wind heeling lever  $l_{w2}$  and GZ curves
- $\theta_R = \theta_0 - \theta_1$
- $X_1$  : Coefficient defined in Tab 1
  - $X_2$  : Coefficient defined in Tab 2
  - $k$  : Coefficient equal to:
    - $k = 1,0$  for a round-bilged ship having no bilge or bar keels
    - $k = 0,7$  for a ship having sharp bilge
    - For a ship having bilge keels, a bar keel or both,  $k$  is defined in Tab 3.
- $r = 0,73 \pm 0,6 (OG)/T_1$
- $OG$  : Distance in m, between the centre of gravity and the waterline (positive if centre of gravity is above the waterline, negative if it is below)
  - $T_1$  : Mean moulded draught in m, of the ship

$s$  : Factor defined in Tab 4.

Note 1: The angle of roll  $\theta_1$  for ships with anti-rolling devices is to be determined without taking into account the operations of these devices.

Note 2: The angle of roll  $\theta_1$  may be obtained, in lieu of the above formula, from model tests or full scale measurements.

The rolling period  $T_R$  in  $s$ , is calculated as follows:

$$T_R = \frac{2CB}{\sqrt{GM}}$$

where:

$$C = 0,373 + 0,023 \frac{B}{T_1} - 0,043 \frac{L_W}{100}$$

The symbols in the tables and formula for the rolling period are defined as follows:

$L_W$  : Length in  $m$ , of the ship at the waterline

$T_1$  : Mean moulded draught in  $m$ , of the ship

$A_K$  : Total overall area in  $m^2$  of bilge keels, or area of the lateral projection of the bar keel, or sum of these areas, or area of the lateral projection of any hull appendages generating added mass during ship roll

$GM$  : Metacentric height in  $m$ , corrected for free surface effect.

**3.2.5** Tab 1 to Tab 4 and formulae described in [3.2.4] are based on data from ships having:

- $B/T_1$  smaller than 3,5
- $(KG/T_1 - 1)$  between  $-0,3$  and  $0,5$
- $T_R$  smaller than 20  $s$ .

For ships with parameters outside of the above limits the angle of roll ( $\theta_1$ ) may be determined with model experiments of a subject ship with the procedure described in IMO MSC.1/Circ. 1200 as the alternative. In addition, the Society may accept such alternative determinations for any ship, if deemed appropriate.

**Table 1 : Values of coefficient  $X_1$**

$B/T_1$	$X_1$
$\leq 2,4$	1,00
2,5	0,98
2,6	0,96
2,7	0,95
2,8	0,93
2,9	0,91
3,0	0,90
3,1	0,88
3,2	0,86
3,4	0,82
$\geq 3,5$	0,80

**Note 1:** Intermediate values in this table are to be obtained by linear interpolation

**Table 2 : Values of coefficient  $X_2$**

$C_B$	$X_2$
$\leq 0,45$	0,75
0,50	0,82
0,55	0,89
0,60	0,95
0,65	0,97
$\geq 0,70$	1,00

**Note 1:** Intermediate values in this table are to be obtained by linear interpolation

Table 3 : Values of coefficient k

$\frac{A_k \times 100}{L \times B}$	k
0,0	1,00
1,0	0,98
1,5	0,95
2,0	0,88
2,5	0,79
3,0	0,74
3,5	0,72
≥ 4,0	0,70

**Note 1:** Intermediate values in this table are to be obtained by linear interpolation

Table 4 : Values of factor s

$T_R$	s
≤ 6	0,100
7	0,098
8	0,093
12	0,065
14	0,053
16	0,044
18	0,038
≥ 20	0,035

**Note 1:** Intermediate values in this table are to be obtained by linear interpolation

**3.2.6** Alternative means for determining the wind heeling lever ( $\ell_{W1}$ ) may be accepted, to the satisfaction of the Society as an equivalent to the calculation in [3.2.3]. When such alternative tests are carried out, reference shall be made based on the Interim Guidelines for alternative assessment of the weather criterion (IMO MSC.1/Circ.1200). the wind velocity used in the tests shall be 26 m/s in full scale with uniform velocity profile. the value of wind velocity used for ships in restricted services may be reduced to the satisfaction of the Society.

## 4 Effects of free surfaces of liquids in tanks

### 4.1 General

**4.1.1** For all loading conditions, the initial metacentric height and the righting lever curve are to be corrected for the effect of free surfaces of liquids in tanks.

### 4.2 Consideration of free surface effects

**4.2.1** Free surface effects are to be considered whenever the filling level in a tank is less than 98% of full condition. Free surface effects need not be considered where a tank is nominally full, i.e. filling level is 98% or above. Free surface effects for small tanks may be ignored under the condition in [4.8.1].

**4.2.2** Nominally full cargo tanks should be corrected for free surface effects at 98% filling level. In doing so, the correction to initial metacentric height should be based on the inertia moment of liquid surface at 5° of the heeling angle divided by displacement, and the correction to righting lever is suggested to be on the basis of real shifting moment of cargo liquids.

### 4.3 Categories of tanks

**4.3.1** Tanks which are taken into consideration when determining the free surface correction may be one of two categories:

- tanks with fixed filling level (e.g. liquid cargo, water ballast). The free surface correction is to be defined for the actual filling level to be used in each tank.
- tanks with variable filling level (e.g. consumable liquids such as fuel oil, diesel oil, and fresh water, and also liquid cargo and water ballast during liquid transfer operations). Except as permitted in [4.5.1] and [4.6.1], the free surface correction is to be the maximum value attainable among the filling limits envisaged for each tank, consistent with any operating instructions.

#### **4.4 Consumable liquids**

**4.4.1** *In calculating the free surfaces effect in tanks containing consumable liquids, it is to be assumed that for each type of liquid at least one transverse pair or a single centreline tank has a free surface and the tank or combination of tanks taken into account are to be those where the effect of free surface is the greatest.*

#### **4.5 Water ballast tanks**

**4.5.1** *Where water ballast tanks, including anti-rolling tanks and anti-heeling tanks, are to be filled or discharged during the course of a voyage, the free surfaces effect is to be calculated to take account of the most onerous transitory stage relating to such operations.*

#### **4.6 Liquid transfer operations**

**4.6.1** *For ships engaged in liquid transfer operations, the free surface corrections at any stage of the liquid transfer operations may be determined in accordance with the filling level in each tank at the stage of the transfer operation.*

#### **4.7 GM<sub>0</sub> and GZ curve corrections**

**4.7.1** *The corrections to the initial metacentric height and to the righting lever curve are to be addressed separately as indicated in [4.7.2] and [4.7.3].*

**4.7.2** *In determining the correction to the initial metacentric height, the transverse moments of inertia of the tanks are to be calculated at 0 degrees angle of heel according to the categories indicated in [4.3.1].*

**4.7.3** *The righting lever curve may be corrected by any of the following methods:*

- *correction based on the actual moment of fluid transfer for each angle of heel calculated; corrections may be calculated according to the categories indicated in [4.3.1]*
- *correction based on the moment of inertia, calculated at 0 degrees angle of heel, modified at each angle of heel calculated; corrections may be calculated according to the categories indicated in [4.3.1].*

**4.7.4** *Whichever method is selected for correcting the righting lever curve, only that method is to be presented in the ship's trim and stability booklet. However, where an alternative method is described for use in manually calculated loading conditions, an explanation of the differences which may be found in the results, as well as an example correction for each alternative, are to be included.*

#### **4.8 Small tanks**

**4.8.1** *Small tanks which satisfy the following condition corresponding to an angle of inclination of 30° need not be included in the correction:*

$$M_{fs}/\Delta_{min} < 0,01 \text{ m}$$

where:

$\Delta_{min}$  : Minimum ship displacement, in t, calculated at  $d_{min}$

$d_{min}$  : Minimum mean service draught, in m, of ship without cargo, with 10% stores and minimum water ballast, if required.

#### **4.9 Remainder of liquid**

**4.9.1** *The usual remainder of liquids in the empty tanks need not be taken into account in calculating the corrections, providing the total of such residual liquids does not constitute a significant free surface effect.*

### **5 Cargo ships carrying timber deck cargoes**

#### **5.1 Application**

**5.1.1** *The provisions given hereunder apply to ships engaged in the carriage of timber deck cargoes. Ships that are provided with and make use of their timber load line are also to comply with the requirements of regulations 41 to 45 of the International Load Line Convention 1966, as amended.*

#### **5.2 Definitions**

##### **5.2.1 Timber**

*Timber means sawn wood or lumber, cants, logs, poles, pulpwood and all other types of timber in loose or packaged forms. The term does not include wood pulp or similar cargo.*

### **5.2.2 Timber deck cargo**

*Timber deck cargo means a cargo of timber carried on an uncovered part of a freeboard or superstructure deck. The term does not include wood pulp or similar cargo.*

### **5.2.3 Timber load line**

*Timber load line means a special load line assigned to ships complying with certain conditions related to their construction set out in the International Convention on Load Lines 1966, as amended, and used when the cargo complies with the stowage and securing conditions of the Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 1991 (Resolution A.715(17)).*

## **5.3 Stability criteria**

**5.3.1** *For ships loaded with timber deck cargoes and provided that the cargo extends longitudinally between superstructures (where there is no limiting superstructure at the after end, the timber deck cargo is to extend at least to the after end of the aftermost hatchway) and transversely for the full beam of ship after due allowance for a rounded gunwale not exceeding 4% of the breadth of the ship and/or securing the supporting uprights and which remains securely fixed at large angles of heel, the Society may apply the criteria given in [5.3.2] to [5.3.5], which substitute those given in [2.1.2], [2.1.3], [2.1.4] and [2.1.5] and in [3.2].*

**5.3.2** *The area under the righting lever curve (GZ curve) is to be not less than 0,08 m·rad up to  $\theta = 40^\circ$  or the angle of flooding if this angle is less than  $40^\circ$ .*

**5.3.3** *The maximum value of the righting lever (GZ) is to be at least 0,25 m.*

**5.3.4** *At all times during a voyage, the metacentric height  $GM_0$  is to be not less than 0,10 m after correction for the free surface effects of liquid in tanks and, where appropriate, the absorption of water by the deck cargo and/or ice accretion on the exposed surfaces. (Details regarding ice accretion are given in [6]).*

**5.3.5** *When determining the ability of the ship to withstand the combined effect of beam wind and rolling according to [3.2], the  $16^\circ$  limiting angle of heel under action of steady wind is to be complied with, but the additional criterion of 80% of the angle of deck edge immersion may be ignored.*

## **5.4 Stability booklet**

**5.4.1** *The ship is to be supplied with comprehensive stability information which takes into account timber deck cargo. Such information is to enable the Master, rapidly and simply, to obtain accurate guidance as to the stability of the ship under varying conditions of service. Comprehensive rolling period tables or diagrams have proved to be very useful aids in verifying the actual stability conditions.*

**5.4.2** *For ships carrying timber deck cargoes, the Society may deem it necessary that the Master be given information setting out the changes in deck cargo from that shown in the loading conditions, when the permeability of the deck cargo is significantly different from 25% (see [5.5.1]).*

**5.4.3** *For ships carrying timber deck cargoes, conditions are to be shown indicating the maximum permissible amount of deck cargo having regard to the lightest stowage rate likely to be met in service.*

## **5.5 Calculation of the stability curve**

**5.5.1** *In addition to the provisions given in Ch 3, App 2, [1.3], the Society may allow account to be taken of the buoyancy of the deck cargo assuming that such cargo has a permeability of 25% of the volume occupied by the cargo. Additional curves of stability may be required if the Society considers it necessary to investigate the influence of different permeabilities and/or assumed effective height of the deck cargo.*

## **5.6 Loading conditions to be considered**

**5.6.1** *The loading conditions which are to be considered for ships carrying timber deck cargoes are specified in Ch 3, App 2, [1.2.2]. For the purpose of these loading conditions, the ship is assumed to be loaded to the summer timber load line with water ballast tanks empty.*

## **5.7 Assumptions for calculating loading conditions**

**5.7.1** *The following assumptions are to be made for calculating the loading conditions referred to in Ch 3, App 2, [1.2.2]:*

- *the amount of cargo and ballast is to correspond to the worst service condition in which all the relevant stability criteria reported in [2.1.2], [2.1.3], [2.1.4] and [2.1.5], or the optional criteria given in [5.3], are met*
- *in the arrival condition, it is to be assumed that the weight of the deck cargo has increased by 10% due to water absorption.*

**5.7.2** The stability of the ship at all times, including during the process of loading and unloading timber deck cargo, is to be positive and in compliance with the stability criteria of [5.3]. It is to be calculated having regard to:

- the increased weight of the timber deck cargo due to:
  - absorption of water in dried or seasoned timber, and
  - ice accretion, if applicable (as reported in [6])
- variations in consumable
- the free surface effect of liquid in tanks, and
- the weight of water trapped in broken spaces within the timber deck cargo and especially logs.

**5.7.3** Excessive initial stability is to be avoided as it will result in rapid and violent motion in heavy seas which will impose large sliding and racking forces on the cargo causing high stresses on the lashings. Unless otherwise stated in the stability booklet, the metacentric height is generally not to exceed 3% of the breadth in order to prevent excessive acceleration in rolling provided that the relevant stability criteria given in [5.3] are satisfied.

**5.8 Stowage of timber deck cargoes**

**5.8.1** The stowage of timber deck cargoes is to comply with the provisions of chapter 3 of the Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 1991 (resolution A.715(17)).

**6 Icing**

**6.1 Application**

**6.1.1** For any ship having an ice class notation or operating in areas where ice accretion is likely to occur, adversely affecting a ship's stability, icing allowances are to be included in the analysis of conditions of loading.

**6.2 Ships carrying timber deck cargoes**

**6.2.1** The Master is to establish or verify the stability of his ship for the worst service condition, having regard to the increased weight of deck cargo due to water absorption and/or ice accretion and to variations in consumable.

**6.2.2** When timber deck cargoes are carried and it is anticipated that some formation of ice will take place, an allowance is to be made in the arrival condition for the additional weight.

**6.2.3 Allowance for ice accretion**

The ice accretion weight,  $w$ , in  $kg/m^2$ , is to be taken as follows:

$$w = 30 \cdot \frac{2,3 (15,2 L - 351,8)}{l_{FB}} \cdot f_{TL} \cdot \frac{l_{bow}}{0,16 L}$$

where:

$f_{TL}$  : Timber and lashing factor:

$$f_{TL} = 1,2$$

$l_{FB}$  : Freeboard height, in mm

$l_{bow}$  : Length of bow flare region, in m, to be taken as the distance from the longitudinal position at which the maximum breadth occurs on a water line located 0,5 m below the freeboard deck at side to the foremost point of the bow at that waterline.

The ice accretion weight  $w$  over the timber deck region is to be applied to each of the load cases as illustrated in Fig 2.

**Figure 2 : Ice accretion load case for timber deck cargoes**

Load cases are to be applied in stability calculations.

### **6.3 Calculation assumptions**

**6.3.1** For ships operating in areas where ice accretion is likely to occur, the following icing allowance is to be made in the stability calculations:

- 30 kg per square metre on exposed weather decks and gangways
- 7,5 kg per square metre for the projected lateral area of each side of the ship above the water plane
- the projected lateral area of discontinuous surfaces of rail, sundry booms, spars (except masts) and rigging of ships having no sails and the projected lateral area of other small objects are to be computed by increasing the total projected area of continuous surfaces by 5% and the static moments of this area by 10%.

**6.3.2** Ships intended for operation in areas where ice is known to occur are to be:

- designed to minimise the accretion of ice, and
- equipped with such means for removing ice as, for example, electrical and pneumatic devices, and/or special tools such as axes or wooden clubs for removing ice from bulwarks, rails and erections.

### **6.4 Guidance relating to ice accretion**

**6.4.1** The following icing areas are to be considered:

- a) The area north of latitude 65°30'N, between longitude 28°W and the west coast of Iceland; north of the north coast of Iceland; north of the rhumb line running from latitude 66°N, longitude 15°W to latitude 73°30'N, longitude 15°E, north of latitude 73°30'N between longitude 15°E and 35°E, and east of longitude 35°E, as well as north of latitude 56°N in the Baltic Sea
- b) The area north of latitude 43°N bounded in the west by the North American coast and the east by the rhumb line running from latitude 43°N, longitude 48°W to latitude 63°N, longitude 28°W and thence along longitude 28°W
- c) All sea areas north of the North American Continent, west of the areas defined in a) and b)
- d) The Bering and Okhotsk Seas and the Tartary Strait during the icing season, and
- e) South of latitude 60°S.

**6.4.2** For ships operating where ice accretion may be expected:

- within the areas defined in a), c), d) and e) of [6.4.1] known to having icing conditions significantly different from those described in [6.3], ice accretion requirements of one half to twice the required allowance may be applied
- within the area defined in b), where ice accretion in excess of twice the allowance required by [6.3] may be expected, more severe requirements than those given in [6.3] may be applied.

# Section 3 Damage Stability

## 1 Application

### 1.1 Ships for which damage stability is required

**1.1.1** Damage stability calculation is required for ships which are assigned with the additional class notation **SDS**.

**1.1.2** The damage stability criteria to be applied depend on the ship type as described by its service notation and corresponding rules defined in Pt A, Ch 1, Sec 2.

**1.1.3** For tankers assigned with a tropical freeboard and granted with **SDS** additional class notation, the corresponding loading conditions and damage stability calculations are to be submitted into the damage stability booklet.

### 1.2 Ships having additional class notation **SDS** and additional service feature **SPxxx** or **SPxxx-capable**

**1.2.1** Ships having the additional class notation **SDS** and the additional service feature **SPxxx** or **SPxxx-capable** are to comply, in addition to the applicable requirements of this Section, with the requirements of Pt D, Ch 11, Sec 3, [2.3], considering the special personnel as passengers, where the attained subdivision index A (defined in Pt D, Ch 11, Sec 3, [2.3.3]) is not to be less than:

- R, where the ship is carrying 240 persons or more
- 0,8 R, where the ship is carrying not more than 60 persons
- R value to be calculated by linear interpolation between 0,8 R and R, where the ship is carrying more than 60 (but not more than 240) persons.

where:

$$R = 1 - \frac{5000}{L_s + 2,5N + 15225}$$

$$N = N_1 + 2 N_2$$

$N_1$  : Number of persons for whom lifeboats are provided

$N_2$  : Number of persons (including officers and crew) the ship is permitted to carry in excess of  $N_1$

$L_s$  : Subdivision length of the ship, as defined in Pt D, Ch 11, Sec 3, [2.1.4]

Where the conditions of service are such that compliance with Pt D, Ch 11, Sec 3, [2.3] on the basis of  $N = N_1 + 2 N_2$  is impracticable and where the Society considers that a suitably reduced degree of hazard exists, a lesser value of N may be taken but in no case less than  $N = N_1 + N_2$ .

**1.2.2** However, for ships having additional class notation **SDS** and additional service feature **SPxxx** or **SPxxx-capable** with xxx less than 240 persons, Pt D, Ch 11, Sec 3, [2.3.12] is not applicable.

## 2 General

### 2.1 Approaches to be followed for damage stability investigation

#### 2.1.1 General

The purpose of damage stability calculations is to assess the equilibrium position and reserve stability of the ship after flooding. In order to assess the behaviour of the ship after damage, two approaches have been developed: the deterministic and the probabilistic, which are to be applied depending on the ship type.

The metacentric heights (GM), stability levers (GZ) and centre of gravity positions for judging the final conditions are to be calculated by the constant displacement (lost buoyancy) method.

#### 2.1.2 Deterministic approach

The deterministic approach is based on standard dimensions of damage extending anywhere along the ship's length or between transverse bulkheads depending on the relevant requirements.

The consequence of such standard of damage is the creation of a group of damage cases, the number of which, as well as the number of compartments involved in each case, depend on the ship's dimensions and internal subdivision.

For each loading condition, each damage case is to be considered, and the applicable criteria are to be complied with.

Different deterministic methods in damage stability have been developed depending on ship type, on freeboard reduction, and on the kind of cargo carried.

The deterministic methods to be applied in the case of freeboard reduction are specified in Ch 3, App 4.

### **2.1.3 Probabilistic approach**

The probabilistic concept takes the probability of survival after collision as a measure of ship safety in the damaged condition, referred to as the attained subdivision index  $A$ .

The damage stability calculations are performed for a limited number of draughts and relevant GM values in order to draw a minimum GM curve where the attained subdivision index  $A$  achieves the minimum required level of safety  $R$ . For cargo ships, each case of damage is not required to comply with the applicable criteria, but the attained index  $A$ , which is the sum of the contribution of all damage cases, is to be equal to or greater than  $R$ .

The probabilistic method developed on the basis of the above-mentioned concepts is detailed in Ch 3, App 3.

As a general rule, the probabilistic method applies to cargo ships of a length not less than 80 m, and for which no deterministic methods apply.

## **3 Documents to be submitted**

### **3.1 Damage stability calculations**

#### **3.1.1 Damage stability documentation**

For all ships to which damage stability requirements apply, documents including damage stability calculations are to be submitted.

The damage stability calculations are to include:

- list of the characteristics (volume, centre of gravity, permeability) of each compartment which can be damaged
- a table of openings in bulkheads, decks and side shell reporting all the information about:
  - identification of the opening
  - vertical, transverse and horizontal location
  - type of closure: sliding, hinged or rolling for doors
  - type of tightness: watertight, weathertight, semi-watertight or unprotected
  - operating system: remote control, local operation, indicators on the bridge, television surveillance, water leakage detection, audible alarm, as applicable
  - foreseen utilization: open at sea, normally closed at sea, kept closed at sea
- list of all damage cases corresponding to the applicable requirements
- detailed results of damage stability calculations for all the loading conditions foreseen in the applicable requirements
- the limiting GM/KG curve, if foreseen in the applicable requirements
- capacity plan
- cross and down flooding devices and the calculations thereof according to Pt D, Ch 11, App 1 with information about diameter, valves, pipe lengths and coordinates of inlet/outlet
- watertight and weathertight door plan with pressure calculation
- side contour and wind profile
- pipes and damaged area when the destruction of these pipes results in progressive flooding.

#### **3.1.2 Additional information for the probabilistic approach**

In addition to the information listed in [3.1.1], the following is to be provided:

- *subdivision length  $L_s$*
- *initial draughts and the corresponding GM-values*
- *required subdivision index  $R$*
- *attained subdivision index  $A$  with a summary table for all contributions for all damaged zones.*
- *draught, trim, GM in damaged condition*
- *damage extension and definition of damage cases with probabilistic values  $p$ ,  $v$  and  $r$*
- *righting lever curve (including  $GZ_{max}$  and range) with factor of survivability  $s$*
- *critical weathertight and unprotected openings with their angle of immersion*
- *details of sub-compartments with amount of in-flooded water/lost buoyancy with their centres of gravity.*

#### **3.1.3 Loading instrument**

As a supplement to the approved damage stability documentation, a loading instrument, approved by the Society, may be used to facilitate the damage stability calculations mentioned in [3.1.1].

The procedure to be followed, as well as the list of technical details to be sent in order to obtain loading instrument approval, are given in Ch 1, Sec 5, [3.7].

## **3.2 Permeabilities**

### **3.2.1 Definition**

*The permeability of a space means the ratio of the volume within that space which is assumed to be occupied by water to the total volume of that space.*

### **3.2.2 General**

The permeabilities relevant to the type of spaces which can be flooded depend on the applicable requirements. Such permeabilities are indicated in Part D or Part E for each type of ship.

## **3.3 Progressive flooding**

### **3.3.1 Definition**

Progressive flooding is the additional flooding of spaces which were not previously assumed to be damaged. Such additional flooding may occur through openings or pipes as indicated in [3.3.2] and [3.3.3].

### **3.3.2 Openings**

The openings may be listed in the following categories, depending on their means of closure:

- **Unprotected**

Unprotected openings may lead to progressive flooding if they are situated within the range of the positive righting lever curve or if they are located below the waterline after damage (at any stage of flooding). Unprotected openings are openings which are not fitted with at least weathertight means of closure, or ventilators that have to remain open to supply air to the engine room, to the emergency generator room or to closed ro-ro and vehicle spaces for the effective operation of the ship.

- **Weathertight**

Openings fitted with weathertight means of closure are not able to sustain a constant head of water, but they can be intermittently immersed within the positive range of stability.

Weathertight openings may lead to progressive flooding if they are located below the waterline after damage (at any stage of flooding).

- **Semi-watertight**

Internal openings fitted with semi-watertight means of closure are able to sustain a constant head of water corresponding to the immersion relevant to the highest waterline after damage at the equilibrium of the intermediate stages of flooding.

Semi-watertight openings may lead to progressive flooding if they are located below the final equilibrium waterline after damage.

- **Watertight**

Internal openings fitted with watertight means of closure are able to sustain a constant head of water corresponding to the distance between the lowest edge of this opening and the bulkhead/freeboard deck.

Air pipe closing devices complying with Pt C, Ch 1, Sec 10, [9.1.6] may not be considered watertight, unless additional arrangements are fitted in order to demonstrate that such closing devices are effectively watertight.

The pressure/vacuum valves (PV valves) currently installed on tankers do not theoretically provide complete watertightness.

Manhole covers may be considered watertight provided the cover is fitted with bolts located such that the distance between their axes is less than five times the bolt's diameter.

Access hatch covers leading to tanks may be considered watertight.

Watertight openings do not lead to progressive flooding.

### **3.3.3 Pipes**

Progressive flooding through pipes may occur when:

- the pipes and connected valves are located within the assumed damage, and no valves are fitted outside the damage
- the pipes, even if located outside the damage, satisfy all of the following conditions:
  - the pipe connects a damaged space to one or more spaces located outside the damage
  - the highest vertical position of the pipe is below the waterline, and
  - no valves are fitted.

*The possibility of progressive flooding through ballast piping passing through the assumed extent of damage, where positive action valves are not fitted to the ballast system at the open ends of the pipes in the tanks served, is to be considered. Where remote control systems are fitted to ballast valves and these controls pass through the assumed extent of damage, then the effect of damage to the system is to be considered to ensure that the valves would remain closed in that event.*

*If pipes, ducts or tunnels are situated within assumed flooded compartments, arrangements are to be made to ensure that progressive flooding cannot thereby extend to compartments other than those assumed flooded. However, the Society may permit minor progressive flooding if it is demonstrated that the additional flooding of those compartments cannot lead to the capsizing or the sinking of the ship.*

Requirements relative to the prevention of progressive flooding are specified in Pt C, Ch 1, Sec 10, [5.5].

### 3.4 Bottom damages

#### 3.4.1 General

Ships which are not fitted with a double bottom as required by Ch 2, Sec 2, [3.1.2] or which are fitted with unusual bottom arrangements as defined in Ch 2, Sec 2, [3.1.6], are to comply with [3.4.2] and [3.4.3].

#### 3.4.2 Bottom damage description

The assumed extent of damage is described in Tab 1.

*If any damage of a lesser extent than the maximum damage specified in Tab 1 would result in a more severe condition, such damage should be considered.*

**Table 1 : Assumed extent of damage**

	For 0,3 L from the forward perpendicular of the ship	Any other part of the ship
Longitudinal extent	1/3 L <sup>2/3</sup> or 14,5 m, whichever is less	1/3 L <sup>2/3</sup> or 14,5 m, whichever is less
Transverse extent	B/6 or 10 m, whichever is less	B/6 or 5 m, whichever is less
Vertical extent, measured from the keel line	B/20, to be taken not less than 0,76 m and not more than 2 m	B/20, to be taken not less than 0,76 m and not more than 2 m

#### 3.4.3 Stability criteria

*Compliance with the requirements of Ch 2, Sec 2, [3.1.5] or Ch 2, Sec 2, [3.1.6] is to be achieved by demonstrating that  $s_i$ , when calculated in accordance with Ch 3, App 3, [1.6], is not less than 1 for all service conditions when subject to a bottom damage with an extent specified in [3.4.2] for any position in the affected part of the ship.*

*Flooding of such spaces shall not render emergency power and lighting, internal communication, signals or other emergency devices inoperable in other parts of the ship.*

## 4 Damage control documentation

### 4.1 General

#### 4.1.1 Application

*The damage control documentation is to include a damage control plan which is intended to provide ship's officers with clear information on the ship's watertight compartmentation and equipment related to maintaining the boundaries and effectiveness of the compartmentation so that, in the event of damage causing flooding, proper precautions can be taken to prevent progressive flooding through openings therein and effective action can be taken quickly to mitigate and, where possible, recover the ship's loss of stability.*

*The damage control documentation is to be clear and easy to understand. It is not to include information which is not directly relevant to damage control, and is to be provided in the language or languages of the ship's officers. If the languages used in the preparation of the documentation are not English or French, a translation into one of these languages is to be included.*

The use of a loading instrument performing damage stability calculations may be accepted as a supplement to the damage control documentation. This instrument is to be approved by the Society according to the requirements of Ch 1, Sec 5, [3.8].

The damage control plan is required for the following ships:

- ships carrying passengers
- cargo ships of 500 GT and over.

#### 4.1.2 Application to ships having additional service feature SPxxx or SPxxx-capable

The damage control documentation of ships having additional service feature **SPxxx** or **SPxxx-capable** is to comply with Pt D, Ch 11, Sec 3, [2.3.14].

## 5 Specific interpretations

### 5.1 Assumed damage penetration in way of sponsons

*5.1.1 If sponsons are fitted, it is necessary to establish the maximum assumed damage penetration (B/5) to be used when deciding on the various damage cases. For this purpose, the breadth B in the way of such sponsons is to be measured to the outside of the sponsons.*

*Clear of any such sponsons, the breadth B is to be the midship breadth measured to the outside of the original shell. In other words, the assumed penetration of B/5 is the same as that which applied before the fitting of sponsons.*

# Appendix 1      Inclining Test and Lightweight Check

## 1 Inclining test and lightweight check

### 1.1 General

#### 1.1.1 General conditions of the ship

The following conditions are to be met, as far as practicable:

- the weather conditions are to be favourable
- the ship should be moored in a quiet, sheltered area free from extraneous forces such as propeller wash from passing vessels, or sudden discharges from shore side pumps. The tide conditions and the trim of the ship during the test should be considered. Prior to the test, the depth of water should be measured and recorded in as many locations as are necessary to ensure that the ship will not contact the bottom. The specific gravity of water should be accurately recorded. The ship should be moored in a manner to allow unrestricted heeling. The access ramps should be removed. Power lines, hoses, etc., connected to shore should be at a minimum, and kept slack at all times
- the ship should be as upright as possible; with inclining weights in the initial position, up to one-half degree of list is acceptable. The actual trim and deflection of keel, if practical, should be considered in the hydrostatic data. In order to avoid excessive errors caused by significant changes in the water plane area during heeling, hydrostatic data for the actual trim and the maximum anticipated heeling angles should be checked beforehand
- cranes, derrick, lifeboats and liferafts capable of inducing oscillations are to be secured
- main and auxiliary boilers, pipes and any other system containing liquids are to be filled
- the bilge and the decks are to be thoroughly dried
- the anticipated liquid loading for the test should be included in the planning for the test. Preferably, all tanks should be empty and clean, or completely full. The number of slack tanks should be kept to an absolute minimum. The viscosity of the fluid, the depth of the fluid and the shape of the tank should be such that the free surface effect can be accurately determined
- the weights necessary for the inclination are to be already on board, located in the correct place. Their certificates are to be presented to the Surveyor witnessing the inclining test and are also to be included into the inclining test report.
- all work on board is to be suspended and crew or personnel not directly involved in the incline test are to leave the ship
- the ship is to be as complete as possible at the time of the test. The number of weights to be removed, added or shifted is to be limited to a minimum. Temporary material, tool boxes, staging, sand, debris, etc., on board is to be reduced to an absolute minimum
- decks should be free of water. Water trapped on deck may shift and pocket in a fashion similar to liquids in a tank. Any rain, snow or ice accumulated on the ship should be removed prior to the test.

#### 1.1.2 Inclining weights

*The total weight used is preferably to be sufficient to provide a minimum inclination of one degree and a maximum of four degrees of heel to each side. The Society may, however, accept a smaller inclination angle for large ships provided that the requirement on pendulum deflection or U-tube difference in height specified in [1.1.4] is complied with. Test weights are to be compact and of such a configuration that the VCG (vertical centre of gravity) of the weights can be accurately determined. Each weight is to be marked with an identification number and its weight. Re-certification of the test weights is to be carried out prior to the incline. A crane of sufficient capacity and reach, or some other means, is to be available during the inclining test to shift weights on the deck in an expeditious and safe manner. Water ballast transfer may be carried out, when it is impractical to incline using solid weights and subject to requirement of [1.1.3].*

*Weights, such as porous concrete, that can absorb significant amounts of moisture should only be used if they are weighed just prior to the inclining test or if recent weight certificates are presented. Each weight should be marked with an identification number and its weight. For small ships, drums completely filled with water may be used. Drums should normally be full and capped to allow accurate weight control. In such cases, the weight of the drums should be verified in the presence of a surveyor of the Society using a recently calibrated scale.*

*Precautions should be taken to ensure that the decks are not overloaded during weight movements. If deck strength is questionable then a structural analysis should be performed to determine if existing framing can support the weight.*

*Generally, the test weights should be positioned as far outboard as possible on the upper deck. The test weights should be on board and in place prior to the scheduled time of the inclining test.*

#### 1.1.3 Water ballast as inclining weight

Where the use of solid weights to produce the inclining moment is deemed to be impracticable, the movement of ballast water may be permitted as an alternative method. This acceptance would be granted for a specific test only, and approval of the test procedure by the Society is required. As a minimal prerequisite for acceptability, the following conditions are to be required:

- inclining tanks are to be wall-sided and free of large stringers or other internal members that create air pockets

- tanks are to be directly opposite to maintain ship's trim
- specific gravity of ballast water is to be measured and recorded
- pipelines to inclining tanks are to be full. If the ship's piping layout is unsuitable for internal transfer, portable pumps and pipes/hoses may be used
- blanks must be inserted in transverse manifolds to prevent the possibility of liquids being "leaked" during transfer. Continuous valve control must be maintained during the test
- all inclining tanks must be manually sounded before and after each shift
- vertical, longitudinal and transverse centres are to be calculated for each movement
- accurate sounding/ullage tables are to be provided. The ship's initial heel angle is to be established prior to the incline in order to produce accurate values for volumes and transverse and vertical centres of gravity for the inclining tanks at every angle of heel. The draught marks amidships (port and starboard) are to be used when establishing the initial heel angle
- verification of the quantity shifted may be achieved by a flowmeter or similar device
- the time to conduct the inclining is to be evaluated. If time requirements for transfer of liquids are considered too long, water may be unacceptable because of the possibility of wind shifts over long periods of time.

### 1.1.4 Pendulums

*The use of three pendulums is recommended but a minimum of two are to be used to allow identification of bad readings at any one pendulum station. However, for ships of a length equal to or less than 30 m, only one pendulum can be accepted. They are each to be located in an area protected from the wind. The pendulums are to be long enough to give a measured deflection, to each side of upright, of at least 15 cm. To ensure recordings from individual instruments are kept separate, it is suggested that the pendulums be physically located as far apart as practical.*

*The use of an inclinometer or U-tube is to be considered in each separate case. It is recommended that inclinometers or other measuring devices only be used in conjunction with at least one pendulum.*

### 1.1.5 Free surface and slack tanks

The number of slack tanks should normally be limited to one port/starboard pair or one centreline tank of the following:

- fresh water reserve feed tanks
- fuel/diesel oil storage tanks
- fuel/diesel oil day tanks
- lube oil tanks
- sanitary tanks
- potable water tanks.

*To avoid pocketing, slack tanks are normally to be of regular (i.e. rectangular, trapezoidal, etc.) cross section and be 20% to 80% full if they are deep tanks and 40% to 60% full if they are double-bottom tanks. These levels ensure that the rate of shifting of liquid remains constant throughout the heel angles of the inclining test. If the trim changes as the ship is inclined, then consideration are also to be given to longitudinal pocketing. Slack tanks containing liquids of sufficient viscosity to prevent free movement of the liquids, as the ship is inclined (such as bunker at low temperature), are to be avoided since the free surface cannot be calculated accurately. A free surface correction for such tanks is not to be used unless the tanks are heated to reduce viscosity. Communication between tanks are never to be allowed. Cross-connections, including those via manifolds, are to be closed. Equal liquid levels in slack tank pairs can be a warning sign of open cross connections. A bilge, ballast, and fuel oil piping plan can be referred to, when checking for cross connection closures.*

### 1.1.6 Means of communications

*Efficient two-way communications are to be provided between central control and the weight handlers and between central control and each pendulum station. One person at a central control station is to have complete control over all personnel involved in the test.*

### 1.1.7 Documentation

*The person in charge of the inclining test is to have available a copy of the following plans at the time of the test:*

- lines plan
- hydrostatic curves or hydrostatic data
- general arrangement plan of decks, holds, inner bottoms, etc.
- capacity plan showing capacities and vertical and longitudinal centres of gravity of cargo spaces, tanks, etc. When water ballast is used as inclining weights, the transverse and vertical centres of gravity for the applicable tanks, for each angle of inclination, must be available
- tank sounding tables
- draught mark locations, and
- docking drawing with keel profile and draught mark corrections (if available).

**1.1.8 Determination of the displacement**

The operations necessary for the accurate evaluation of the displacement of the ship at the time of the inclining test, as listed below, are to be carried out:

- draught mark readings are to be taken at aft, midship and forward, at starboard and port sides
- the mean draught (average of port and starboard reading) is to be calculated for each of the locations where draught readings are taken and plotted on the ship's lines drawing or outboard profile to ensure that all readings are consistent and together define the correct waterline. The resulting plot is to yield either a straight line or a waterline which is either hogged or sagged. If inconsistent readings are obtained, the freeboards/ draughts are to be retaken
- the specific gravity of the sea water is to be determined. Samples are to be taken from a sufficient depth of the water to ensure a true representation of the sea water and not merely surface water, which could contain fresh water from run off of rain. A hydrometer is to be placed in a water sample and the specific gravity read and recorded. For large ships, it is recommended that samples of the sea water be taken forward, midship and aft, and the readings averaged. For small ships, one sample taken from midship is sufficient. The temperature of the water is to be taken and the measured specific gravity corrected for deviation from the standard, if necessary.

A correction to water specific gravity is not necessary if the specific gravity is determined at the inclining experiment site. Correction is necessary if specific gravity is measured when the sample temperature differs from the temperature at the time of the inclining (e.g., if the check of specific gravity is performed at the office). Where the value of the average calculated specific gravity is different from that reported in the hydrostatic curves, adequate corrections are to be made to the displacement curve

- all double bottoms, as well as all tanks and compartments which can contain liquids, are to be checked, paying particular attention to air pockets which may accumulate due to the ship's trim and the position of air pipes, and also taking into account the provisions of [1.1.1]
- it is to be checked that the bilge is dry, and an evaluation of the liquids which cannot be pumped, remaining in the pipes, boilers, condenser, etc., is to be carried out
- the entire ship is to be surveyed in order to identify all items which need to be added, removed or relocated to bring the ship to the lightship condition. Each item is to be clearly identified by weight and location of the centre of gravity
- the possible solid permanent ballast is to be clearly identified and listed in the report.
- normally, the total value of missing weights is not to exceed 2% and surplus weights, excluding liquid ballast, not exceed 4% of the lightship displacement. For smaller vessels, higher percentages may be allowed.

**1.1.9 The incline**

The standard test generally employs eight distinct weight movements as shown in Fig 1.

Movement No.8, a recheck of the zero point, may be omitted if a straight line plot is achieved after movement No.7. If a straight line plot is achieved after the initial zero and six weight movements, the inclining test is complete and the second check at zero may be omitted. If a straight line plot is not achieved, those weight movements that did not yield acceptable plotted points should be repeated or explained.

**Figure 1 : Weight shift procedure**

The weights are to be transversely shifted, so as not to modify the ship's trim and vertical position of the centre of gravity. After each weight shifting, the new position of the transverse centre of gravity of the weights is to be accurately determined. After each weight movement, the distance the weight was moved (centre to centre) is to be measured and the heeling moment calculated by multiplying the distance by the amount of weight moved. The tangent is calculated for each pendulum by dividing the deflection by the length of the pendulum. The resultant tangents are plotted on the graph as shown in Fig 2. The plot is to be run during the test to ensure that acceptable data are being obtained. The pendulum deflection is to be read when the ship has reached a final position after each weight shifting. During the reading, no movements of personnel are allowed. For ships with a length equal to or less than 30 m, six distinct weight movements may be accepted.

**Figure 2 : Graph of resultant tangents**

# Appendix 2 Trim and Stability Booklet

## 1 Trim and stability booklet

### 1.1 Information to be included in the trim and stability booklet

#### 1.1.1 General

A trim and stability booklet is a stability manual, to be approved by the Society, which is to contain information to enable the Master to operate the ship in compliance with the applicable requirements contained in the Rules.

The format of the stability booklet and the information included vary depending on the ship type and operation.

Additional information may be required depending on the type of the ship as specified in Part D and Part E.

#### 1.1.2 List of information

The following information is to be included in the trim and stability booklet:

- A general description of the ship, including:
  - the ship's name and the Society classification number
  - the ship type and service notation
  - the class notations
  - the yard, the hull number and the year of delivery
  - the Flag, the port of registry, the international call sign and the IMO number
  - the moulded dimensions
  - the draught corresponding to the assigned summer load line, the draught corresponding to the assigned summer timber load line and the draught corresponding to the tropical load line, if applicable
  - the displacement corresponding to the above-mentioned draughts.
- Instructions on the use of the booklet.
- General arrangement and capacity plans indicating the assigned use of compartments and spaces (cargo, passenger, stores, accommodation, etc.).
- A sketch indicating the position of the draught marks referred to the ship's perpendiculars.
- Hydrostatic curves or tables corresponding to the design trim, and, if significant trim angles are foreseen during the normal operation of the ship, curves or tables corresponding to such range of trim are to be introduced. A reference relevant to the sea density, in  $t/m^3$ , is to be included as well as the draught measure (from keel or underkeel).
- Cross curves (or tables) of stability calculated on a free trimming basis, for the ranges of displacement and trim anticipated in normal operating conditions, with indication of the volumes which have been considered in the computation of these curves.
- Tank sounding tables or curves showing capacities, centres of gravity, and free surface data for each tank.
- Lightship data from the inclining test, as indicated in Ch 3, Sec 1, [2.2], including lightship displacement, centre of gravity co-ordinates, place and date of the inclining test, as well as the Society approval details specified in the inclining test report. It is suggested that a copy of the approved test report be included.

Where the above-mentioned information is derived from a sister ship, the reference to this sister ship is to be indicated, and a copy of the approved inclining test report relevant to this sister ship is to be included.

- Standard loading conditions as indicated in [1.2] and examples for developing other acceptable loading conditions using the information contained in the booklet.
- Intact stability results (total displacement and its centre of gravity co-ordinates, draughts at perpendiculars, GM, GM corrected for free surfaces effect, GZ values and curve, criteria as indicated in Ch 3, Sec 2, [2] and Ch 3, Sec 2, [3] as well as possible additional criteria specified in Part D or Part E when applicable, reporting a comparison between the actual and the required values) are to be available for each of the above-mentioned operating conditions. The method and assumptions to be followed in the stability curve calculation are specified in [1.3].
- Information on loading restrictions (maximum allowable load on double bottom, maximum specific gravity allowed in liquid cargo tanks, maximum filling level or percentage in liquid cargo tanks, maximum KG or minimum GM curve or table which can be used to determine compliance with the applicable intact and damage stability criteria) when applicable.
- Information about openings (location, tightness, means of closure), pipes or other progressive flooding sources.
- Information concerning the use of any special cross-flooding fittings with descriptions of damage conditions which may require cross-flooding, when applicable.
- Any other guidance deemed appropriate for the operation of the ship.
- A table of contents and index for each booklet.

## 1.2 Loading conditions

### 1.2.1 General

The standard loading conditions to be included in the trim and stability booklet are:

- lightship condition
- ship in ballast in the departure condition, without cargo but with full stores and fuel
- ship in ballast in the arrival condition, without cargo and with 10% stores and fuel remaining.

Further loading cases may be included when deemed necessary or useful.

The heel at the equilibrium of any sailing condition is not to be greater than 1°.

### 1.2.2 Ships carrying cargo on deck

In addition to the loading conditions indicated in [1.2.1] to [1.2.14], in the case of cargo carried on deck the following cases are to be considered:

- ship in the fully loaded departure condition having cargo homogeneously distributed in the holds and a cargo specified in extension and weight on deck, with full stores and fuel
- ship in the fully loaded arrival condition having cargo homogeneously distributed in holds and a cargo specified in extension and weight on deck, with 10% stores and fuel.

### 1.2.3 General cargo ships

In addition to the standard loading conditions reported in [1.2.1], the following loading cases are to be included in the trim and stability booklet:

- ship in the fully loaded departure condition, with cargo homogeneously distributed throughout all cargo spaces and with full stores and fuel
- ship in the fully loaded arrival condition with cargo homogeneously distributed throughout all cargo spaces and with 10% stores and fuel remaining.

For ships with service notation **general cargo ship** completed by the additional feature **nonhomload**, the following loading cases are also to be included in the trim and stability booklet:

- Ship in the departure condition, with cargo in alternate holds, for at least three stowage factors, one of which is relevant to the summer load waterline and with full stores and consumables.

Where the condition with cargo in alternate holds relevant to the summer load waterline leads to local loads on the double bottom greater than those allowed by the Society, it is to be replaced by the one in which each hold is filled in order to reach the maximum load allowed on the double bottom; in no loading case is such value to be exceeded

- Same conditions as above, but with 10% stores and consumables.

### 1.2.4 Container ships

In addition to the standard loading conditions specified in [1.2.1], for ships with the service notation **container ship** the following loading cases are to be included in the trim and stability booklet:

- ship with a number of containers having a weight corresponding to the maximum permissible weight for each container at the summer load waterline when loaded with full stores and consumables
- same loading condition as above, but with 10% stores and consumables

The vertical location of the centre of gravity for each container is generally to be taken at one half of the container height. Different locations of the vertical centre of gravity may be accepted in specific cases, if documented.

### 1.2.5 Bulk carriers, ore carriers and combination carriers

Dry cargo is intended to mean grain, as well as any other type of solid bulk cargo.

The term grain covers wheat, maize (corn), oats, rye, barley, rice, pulses, seeds and processed forms thereof, whose behaviour is similar to that of grain in its natural state.

The term solid bulk cargo covers any material, other than liquid or gas, consisting of a combination of particles, granules or any larger pieces of material, generally uniform in composition, which is loaded directly into the cargo spaces of a ship without any intermediate form of containment.

In addition to the standard loading conditions defined in [1.2.1], for ships with the service notation **bulk carrier**, **bulk carrier ESP**, **self-unloading bulk carrier ESP**, **ore carrier ESP** and **combination carrier ESP** the following loading cases are to be included in the trim and stability booklet:

- ship in the fully loaded departure conditions at the summer load waterline, with cargo homogeneously distributed throughout all cargo holds and with full stores and consumables, for at least three specific gravities, one of which is relevant to the complete filling of all cargo holds
- same conditions as above, but with 10% stores and consumables
- ship in the departure condition, with cargo holds not entirely filled, for at least three stowage factors, one of which is relevant to the summer load waterline and with full stores and consumables
- same conditions as above, but with 10% stores and consumables.

For ships with one of the service notations **self-unloading bulk carrier ESP**, **ore carrier ESP** and **combination carrier ESP** and for ships with the service notation **bulk carrier** or **bulk carrier ESP** completed by the additional feature **nonhomload**, the following loading cases are also to be included in the trim and stability booklet:

- Ship in the departure conditions, with cargo in alternate holds, for at least three stowage factors, one of which is relevant to the summer load waterline, and with full stores and consumables.

Where the condition with cargo in alternate holds relevant to the summer load waterline leads to local loads on the double bottom greater than those allowed by the Society, it is to be replaced by the one in which each hold is filled in order to reach the maximum load allowed on the double bottom; in no loading case is such value to be exceeded.

- Same conditions as above, but with 10% stores and consumables.

### 1.2.6 Oil tankers and FLS tankers

All the intended cargo loading conditions are to be included in the trim and stability booklet for examination within the scope of Pt D, Ch 7, Sec 3, [2].

Further cases are subject to prior examination by the Society before the loading; alternatively, an approved loading instrument capable of performing damage stability calculations in accordance with the requirements in Pt D, Ch 7, Sec 3, [2] may be used.

In addition to the standard loading conditions specified in [1.2.1], for ships with the service notation **oil tanker ESP** or **FLS tanker** the following loading cases are to be included in the trim and stability booklet:

- Ship in the fully loaded departure condition at the summer load waterline, with cargo homogeneously distributed throughout all cargo tanks and with full stores and consumables.
- Same condition as above, but with 10% stores and consumables.
- Ship in the departure condition loaded with a cargo having a density in order to fill all cargo tanks, with full stores and consumables, but immersed at a draught less than the summer load waterline.
- Same condition as above, but with 10% stores and consumables.
- Ship in the fully loaded departure condition at the summer load waterline, with cargo tanks not entirely filled and with full stores and consumables.
- Same condition as above, but with 10% stores and consumables.
- Two loading conditions corresponding to different cargo segregations in order to have slack tanks with full stores and consumables.

When it is impossible to have segregations, these conditions are to be replaced by loading conditions with the same specific gravity and with slack cargo tanks.

- Same loading condition as above, but with 10% stores and consumables.
- For oil tankers having segregated ballast tanks as defined in Pt D, Ch 7, Sec 2, [2], the lightship condition with segregated ballast only is also to be included in the trim and stability booklet for examination.
- If a tropical load line is assigned in accordance with the International Load Line Convention:
  - ship in the fully loaded departure condition at the tropical load line, with cargo homogeneously distributed throughout all cargo tanks and see water density taken equal to 1,025 t/m<sup>3</sup>
  - same loading condition as above, but with 10% store and consumables.

### 1.2.7 Chemical tankers

All the intended cargo loading conditions are to be included in the trim and stability booklet for examination within the scope of Pt D, Ch 8, Sec 2, [6].

Further cases are subject to prior examination by the Society before the loading; alternatively, an approved loading instrument capable of performing damage stability calculations in accordance with Pt D, Ch 8, Sec 2, [6] may be used.

In addition to the standard loading conditions defined in [1.2.1], for ships with the service notation **chemical tanker ESP** the following loading cases are to be included in the trim and stability booklet:

- Ship in the fully loaded departure condition, with cargo homogeneously distributed throughout all cargo tanks and with full stores and consumables.
- Same loading condition as above, but with 10% stores and consumables.
- Three loading conditions corresponding to different specific gravities with cargo homogeneously distributed throughout all cargo tanks and with full stores and consumables.
- Same loading conditions as above, but with 10% stores and consumables.
- Four loading conditions corresponding to different cargo segregations in order to have slack tanks with full stores and consumables. Cargo segregation is intended to mean loading conditions with liquids of different specific gravities.

When it is impossible to have segregations, these conditions are to be replaced by loading conditions corresponding to different specific gravities with slack cargo tanks.

- Same loading conditions as above, but with 10% stores and consumables.

When it is impossible to have segregations, these conditions may be replaced by cases corresponding to different specific gravities with slack cargo tanks.

- If a tropical load line is assigned in accordance with the International Load Line Convention:
  - ship in the fully loaded departure condition at the tropical load line, with cargo homogeneously distributed throughout all cargo tanks and see water density taken equal to 1,025 t/m<sup>3</sup>
  - same loading condition as above, but with 10% store and consumables.

### 1.2.8 Liquefied gas carriers

All the intended cargo loading conditions are to be included in the trim and stability booklet for examination within the scope of Pt D, Ch 9, Sec 2, [7.1.2].

Further cases are subject to prior examination by the Society before the loading; alternatively, an approved loading instrument capable of performing damage stability calculations in accordance with Pt D, Ch 9, Sec 2, [7.1.2] may be used.

In addition to the standard loading conditions defined in [1.2.1], for ships with the service notation **liquefied gas carrier** the following loading cases are to be included in the trim and stability booklet:

- ship in the fully loaded departure condition, with cargo homogeneously distributed throughout all cargo spaces and with full stores and fuel
- ship in the fully loaded arrival condition with cargo homogeneously distributed throughout all cargo spaces and with 10% stores and fuel remaining.
- If a tropical load line is assigned in accordance with the International Load Line Convention:
  - ship in the fully loaded departure condition at the tropical load line, with cargo homogeneously distributed throughout all cargo tanks and see water density taken equal to 1,025 t/m<sup>3</sup>
  - same loading condition as above, but with 10% store and consumables.

### 1.2.9 Passenger ships

In addition to the standard loading conditions specified in [1.2.1], for ships with the service notation **passenger ship** the following loading cases are to be included in the trim and stability booklet:

- ship in the fully loaded departure condition with full stores and fuel and with the full number of passengers with their luggage
- ship in the fully loaded arrival condition, with the full number of passengers and their luggage but with only 10% stores and fuel remaining
- ship without cargo, but with full stores and fuel and the full number of passengers and their luggage
- ship in the same condition as above, but with only 10% stores and fuel remaining.

### 1.2.10 Dredgers

For ships with one of the service notations **dredger, hopper dredger, hopper unit, split hopper dredger** and **split hopper unit**, the loading conditions described in a) and b) are to replace the standard loading conditions defined in [1.2.1].

a) State of cargo: liquid

- Ship loaded to the dredging draught with cargo considered as a liquid.
- Hopper(s) fully loaded with a homogeneous cargo having density  $\rho_m$ , up to the spill out edge of the hopper coaming:

$$\rho_m = M_1 / V_1$$

$M_1$  : Mass of cargo, in t, in the hopper when loaded at the dredging draught

$V_1$  : Volume, in m<sup>3</sup>, of the hopper at the spill out edge of the hopper coaming.

The conditions of stores and fuel are to be equal to 100% and 10%, and an intermediate condition is to be considered if it is more critical than both 100% and 10%.

- Hopper(s) filled or partly filled with a homogeneous cargo having densities equal to 1000, 1200, 1400, 1600, 1800 and 2000 kg/m<sup>3</sup>.

When the dredging draught cannot be reached due to the density of the cargo, the hopper is to be considered filled up to the spill out edge of the hopper coaming.

The conditions of stores and fuel are to be the most conservative obtained from the stability calculations with the density  $\rho_m$ .

b) State of the cargo: solid

- Ship loaded to the dredging draught with cargo considered as a solid.
- Hopper(s) fully loaded with a homogeneous cargo having density  $\rho_m$  up to the spill out edge of the hopper coaming, as calculated in a).

The conditions of stores and fuel are to be equal to 100% and 10%, and an intermediate condition is to be considered if it is more conservative than both 100% and 10%.

- Hopper(s) filled or partly filled with a homogeneous cargo having densities equal to 1400, 1600, 1800, 2000 and 2200 kg/m<sup>3</sup> if greater than  $\rho_m$ .

### **1.2.11 Tugs and fire-fighting ships**

In addition to the standard loading conditions defined in [1.2.1], for ships with one of the service notations **tug** and **fire-fighting**, the following loading cases are to be included in the trim and stability booklet:

- ship in the departure condition at the waterline corresponding to the maximum assigned immersion, with full stores, provisions and consumables
- same conditions as above, but with 10% stores and consumables
- same conditions as above, but with 50% stores and consumables.

### **1.2.12 Anchor handling vessels**

In addition to the standard loading conditions defined in [1.2.1], for ships with the service notation **anchor handling**, the following loading cases are to be included in the trim and stability booklet:

- service loading condition at the maximum draught at which anchor handling operations may occur with the heeling levers as defined in Pt E, Ch 2, Sec 3, [1.3] for the line tension the ship is capable of with a minimum of 67% stores and fuel, in which all the relevant stability criteria defined in Pt E, Ch 2, Sec 3 are met.
- service loading condition at the minimum draught at which anchor handling operations may occur with the heeling levers as defined in Pt E, Ch 2, Sec 3, [1.3] for the line tension the ship is capable of with 10% stores and fuel, in which all the relevant stability criteria as defined in Pt E, Ch 2, Sec 3 are met.

### **1.2.13 Supply vessels**

In addition to the standard loading conditions specified in [1.2.1], for ships with the service notation **supply** the following loading cases are to be included in the trim and stability booklet:

- ship in the fully loaded departure condition having under deck cargo, if any, and cargo specified by position and weight on deck, with full stores and fuel, corresponding to the worst service condition in which all the relevant stability criteria are met
- ship in the fully loaded arrival condition with cargo as specified above, but with 10 per cent stores and fuel
- ship in the worst anticipated operating condition.

### **1.2.14 Fishing vessels**

In addition to the standard loading conditions defined in [1.2.1], for ships with the service notation **fishing vessel** the following loading cases are to be included in the trim and stability booklet:

- departure conditions for the fishing grounds with full fuel stores, ice, fishing gear, etc.
- departure from the fishing grounds with full catch
- arrival at home port with 10% stores, fuel, etc. remaining and full catch
- arrival at home port with 10% stores, fuel, etc. and a minimum catch, which is normally to be 20% of the full catch but may be up to 40% if documented.

### **1.2.15 Oil recovery ships**

For oil recovery ships, additional information to be included in stability booklet are specified in Pt E, Ch 5, Sec 2.

### **1.2.16 Lifting units**

For lifting units, additional information to be included in stability booklet are specified in Pt E, Ch 8, Sec 3.

### **1.2.17 Semi-submersible cargo ships**

For semi-submersible cargo ships, additional information to be included in stability booklet are specified in Pt E, Ch 9, Sec 3.

### **1.2.18 Ships assigned the additional service feature SPxxx or SPxxx-capable**

In addition to the loading conditions specified in [1.2.1] and [1.2.2] to [1.2.17] as applicable, for ships assigned the additional service feature **SPxxx** or **SPxxx-capable**, the following cases are to be included in the trim and stability booklet:

- ship in the fully loaded departure condition, having cargo specified by position and weight, with full stores and fuel, and with the total number of persons on board, including crew, special personnel and passengers
- ship in the fully loaded arrival condition, with cargo and total number of persons as specified above, but with 10 per cent stores and fuel
- ship in the worst anticipated operating condition.

### **1.2.19 Ships assigned the additional service feature OCC (ships fitted with onboard carbon capture and storage system)**

For ships assigned the additional service feature **OCC**, the arrival conditions specified in [1.2.1] and [1.2.2] to [1.2.18] as applicable, are to include the CO<sub>2</sub> storage tank filled at its maximum allowable filling level.

### **1.3 Stability curve calculation**

#### **1.3.1 General**

*Hydrostatic and stability curves are normally prepared on a designed trim basis. However, where the operating trim or the form and arrangement of the ship are such that change in trim has an appreciable effect on righting arms, such change in trim is to be taken into account.*

*The calculations are to take into account the volume to the upper surface of the deck sheathing.*

#### **1.3.2 Superstructures, deckhouses, etc. which may be taken into account**

*Enclosed superstructures complying with Ch 1, Sec 3, [2.2] may be taken into account.*

*The second tier of similarly enclosed superstructures may also be taken into account.*

*Deckhouses on the freeboard deck may be taken into account, provided that they comply with the conditions for enclosed superstructures laid down in Ch 1, Sec 3, [2.2.2].*

*Where deckhouses comply with the above conditions, except that no additional exit is provided to a deck above, such deckhouses are not to be taken into account; however, any deck openings inside such deckhouses are to be considered as closed even where no means of closure are provided.*

*Deckhouses, the doors of which do not comply with the requirements of Ch 11, Sec 5, [1.5.4], are not to be taken into account; however, any deck openings inside the deckhouse are regarded as closed where their means of closure comply with the requirements of Ch 11, Sec 9, [8.3] or Ch 11, Sec 10, as relevant.*

*Deckhouses on decks above the freeboard deck are not to be taken into account, but openings within them may be regarded as closed.*

*Superstructures and deckhouses not regarded as enclosed may, however, be taken into account in stability calculations up to the angle at which their openings are flooded (at this angle, the static stability curve is to show one or more steps, and in subsequent computations the flooded space are to be considered non-existent).*

*Trunks may be taken into account. Hatchways may also be taken into account having regard to the effectiveness of their closures.*

#### **1.3.3 Angle of flooding**

*In cases where the ship would sink due to flooding through any openings, the stability curve is to be cut short at the corresponding angle of flooding and the ship is to be considered to have entirely lost its stability.*

*Small openings such as those for passing wires or chains, tackle and anchors, and also holes of scuppers, discharge and sanitary pipes are not to be considered as open if they submerge at an angle of inclination more than 30°. If they submerge at an angle of 30° or less, these openings are to be assumed open if the Society considers this to be a source of significant progressive flooding; therefore such openings are to be considered on a case by case basis.*

# Appendix 3 Probabilistic Damage Stability Method for Cargo Ships

## 1 Probabilistic damage stability method for cargo ships

### 1.1 Application

**1.1.1** The requirements included in this Appendix are to be applied to cargo ships over 80 m in length  $L_{LL}$  as defined in Ch 1, Sec 3, [2.1.2], but are not to be applied to those ships which are shown to comply with subdivision and damage stability regulations already required in Part D or Part E.

Any reference hereinafter to regulations refers to the set of regulations contained in this Appendix.

The Society may, for a particular ship or group of ships, accept alternative arrangements, if it is satisfied that at least the same degree of safety as represented by these regulations is achieved.

This includes, for example, the following:

- ships constructed in accordance with a standard of damage stability with a set of damage criteria agreed by the Society
- ships of a multi-hull design, where the subdivision arrangements need to be evaluated against the basic principles of the probabilistic method since the regulations have been written specifically for mono-hulls.

**1.1.2** The requirements of this Appendix are to be applied in conjunction with the explanatory notes as set out by the IMO Resolution MSC.429 (98)/Rev.2.

### 1.2 Definitions

#### 1.2.1 Deepest subdivision draught

The deepest subdivision draught ( $d_s$ ) is the waterline which corresponds to the summer load line draught of the ship.

#### 1.2.2 Light service draught

Light service draught ( $d_l$ ) is the service draught corresponding to the lightest anticipated loading and associated tankage, including, however, such ballast as may be necessary for stability and/or immersion.

#### 1.2.3 Partial subdivision draught

The partial subdivision draught ( $d_p$ ) is the light service draught plus 60% of the difference between the light service draught and the deepest subdivision draught.

#### 1.2.4 Subdivision length $L_s$

The subdivision length  $L_s$  is the greatest projected moulded length of that part of the ship at or below deck or decks limiting the vertical extent of flooding with the ship at the deepest subdivision draught.

#### 1.2.5 Machinery space

Machinery spaces are spaces between the watertight boundaries of a space containing the main and auxiliary propulsion machinery, including boilers, generators and electric motors primarily intended for propulsion. In the case of unusual arrangements, the Society may define the limits of the machinery spaces.

#### 1.2.6 Other definitions

Mid-length is the mid point of the subdivision length of the ship.

Aft terminal is the aft limit of the subdivision length.

Forward terminal is the forward limit of the subdivision length.

Breadth  $B$  is the greatest moulded breadth, in m, of the ship at or below the deepest subdivision draught.

Draught  $d$  is the vertical distance, in m, from the moulded baseline at mid-length to the waterline in question.

Permeability  $\mu$  of a space is the proportion of the immersed volume of that space which can be occupied by water.

Note 1: In determining the permeability of a space, the volume of a space is to be taken as the moulded volume, i.e. the immersed volume of a space shall be the underwater moulded volume of that space multiplied by the permeability.

### 1.3 Required subdivision index R

**1.3.1** These regulations are intended to provide ships with a minimum standard of subdivision.

The degree of subdivision to be provided is to be determined by the required subdivision index R, as follows:

- for ships greater than 100 m in length  $L_S$ :

$$R = 1 - \frac{128}{L_S + 152}$$

- for ships of 80 m in length  $L_S$  and upwards, but not greater than 100 m in length  $L_S$ :

$$R = 1 - \frac{1}{\left(1 + \frac{L_S}{100} \frac{R_0}{(1 - R_0)}\right)}$$

where  $R_0$  is the value of R as calculated in accordance with the formula given for ships greater than 100 m in length  $L_S$ .

### 1.4 Attained subdivision index A

**1.4.1** The attained subdivision index A is obtained by the summation of the partial indices  $A_S$ ,  $A_P$  and  $A_L$  (weighed as shown), calculated for the draughts  $d_S$ ,  $d_P$  and  $d_L$  defined in [1.2.1], [1.2.2] and [1.2.3], in accordance with the following formula:

$$A = 0,4 A_S + 0,4 A_P + 0,2 A_L$$

The attained subdivision index A is not to be less than the required subdivision index R. In addition, the partial indices  $A_S$ ,  $A_P$  and  $A_L$  are not to be less than 0,5 R.

**1.4.2** Each partial index is a summation of contributions from all damage cases taken in consideration, using the following formula:

$$A = \sum p_i s_i$$

where:

- $i$  : Represents each compartment or group of compartments under consideration
- $p_i$  : Accounts for the probability that only the compartment or group of compartments under consideration may be flooded, disregarding any horizontal subdivision, as defined in [1.5]
- $s_i$  : Accounts for the probability of survival after flooding the compartment or group of compartments under consideration, and includes the effects of any horizontal subdivision, as defined in [1.6].

**1.4.3** As a minimum, the calculation of A is to be carried out at the level trim for the deepest subdivision draught  $d_S$  and the partial subdivision draught  $d_P$ . The estimated service trim may be used for the light service draught  $d_L$ . If, in any anticipated service condition within the draught range from  $d_S$  to  $d_L$ , the trim variation in comparison with the calculated trim is greater than 0,005 L, one or more additional calculations of A are to be performed for the same draughts but including sufficient trims to ensure that, for all intended service conditions, the difference in trim in comparison with the reference trim used for one calculation will be not more than 0,005L. Each additional calculation of A is to comply with [1.3].

When determining the positive righting lever (GZ) of the residual stability curve in the intermediate and final equilibrium stages of flooding, the displacement used should be that of the intact loading condition. All calculations should be done with the ship freely trimming.

The summation indicated by the formula in [1.4.2] is to be taken over the ship's subdivision length ( $L$ ) for all cases of flooding in which a single compartment or two or more adjacent compartments are involved. In the case of unsymmetrical arrangements, the calculated A value is to be the mean value obtained from calculations involving both sides. Alternatively, it is to be taken as that corresponding to the side which evidently gives the least favourable result.

**1.4.4** Wherever wing compartments are fitted, contribution to the summation indicated by the formula is to be taken for all cases of flooding in which wing compartments are involved. Additionally, cases of simultaneous flooding of a wing compartment or group of compartments and the adjacent inboard compartment or group of compartments, but excluding damage of transverse extent greater than one half of the ship breadth B, may be added. For the purpose of this regulation, transverse extent is measured inboard from ship's side, at right angle to the centreline at the level of the deepest subdivision draught.

**1.4.5** In the flooding calculations carried out according to the regulations, only one breach of the hull and only one free surface need to be assumed. The assumed vertical extent of damage is to extend from the baseline upwards to any watertight horizontal subdivision above the waterline or higher. However, if a lesser extent of damage gives a more severe result, such extent is to be assumed.

**1.4.6** If pipes, ducts or tunnels are situated within the assumed extent of damage, arrangements are to be made to ensure that progressive flooding cannot thereby extend to compartments other than those assumed flooded. However, the Society may permit minor progressive flooding if it is demonstrated that its effects can be easily controlled and the safety of the ship is not impaired.

**1.5 Calculation of factor  $p_i$**

**1.5.1** The factor  $p_i$  for a compartment or group of compartments is to be calculated in accordance with [1.5.2] to [1.5.6] using the following notations:

- $j$  : The aftmost damage zone number involved in the damage starting with no.1 at the stern
- $n$  : The number of adjacent damage zones involved in the damage
- $k$  : The number of a particular longitudinal bulkhead as barrier for transverse penetration in a damage zone, counted from shell towards the centreline. The shell has  $k = 0$
- $x_1$  : The distance from the aft terminal of  $L_s$  to the aft end of the zone in question
- $x_2$  : The distance from the aft terminal of  $L_s$  to the forward end of the zone in question
- $b$  : The mean transverse distance in metres measured at right angles to the centreline at the deepest subdivision draught between the shell and an assumed vertical plane extended between the longitudinal limits used in calculating the factor  $p_i$  and which is a tangent to, or common with, all or part of the outermost portion of the longitudinal bulkhead under consideration. This vertical plane shall be so orientated that the mean transverse distance to the shell is a maximum, but not more than twice the least distance between the plane and the shell. If the upper part of a longitudinal bulkhead is below the deepest subdivision draught, the vertical plane used for the determination of  $b$  is assumed to extend upwards to the deepest subdivision waterline. In any case,  $b$  is not to be taken greater than  $B/2$ .

If the damage involves a single zone only:

$$p_i = p(x_{1(j)}, x_{2(j)}) \cdot [r(x_{1(j)}, x_{2(j)}, b_k) - r(x_{1(j)}, x_{2(j)}, b_{(k-1)})]$$

If the damage involves two adjacent zones:

$$p_i = p(x_{1(j)}, x_{2(j+1)}) \cdot [r(x_{1(j)}, x_{2(j+1)}, b_k) - r(x_{1(j)}, x_{2(j+1)}, b_{(k-1)})] \\ - p(x_{1(j)}, x_{2(j)}) \cdot [r(x_{1(j)}, x_{2(j)}, b_k) - r(x_{1(j)}, x_{2(j)}, b_{(k-1)})] \\ - p(x_{1(j+1)}, x_{2(j+1)}) \cdot [r(x_{1(j+1)}, x_{2(j+1)}, b_k) - r(x_{1(j+1)}, x_{2(j+1)}, b_{(k-1)})]$$

If the damage involves three or more adjacent zones:

$$p_i = p(x_{1(j)}, x_{2(j+n-1)}) \cdot [r(x_{1(j)}, x_{2(j+n-1)}, b_k) - r(x_{1(j)}, x_{2(j+n-1)}, b_{(k-1)})] \\ - p(x_{1(j)}, x_{2(j+n-2)}) \cdot [r(x_{1(j)}, x_{2(j+n-2)}, b_k) - r(x_{1(j)}, x_{2(j+n-2)}, b_{(k-1)})] \\ - p(x_{1(j+1)}, x_{2(j+n-1)}) \cdot [r(x_{1(j+1)}, x_{2(j+n-1)}, b_k) - r(x_{1(j+1)}, x_{2(j+n-1)}, b_{(k-1)})] \\ + p(x_{1(j+1)}, x_{2(j+n-2)}) \cdot [r(x_{1(j+1)}, x_{2(j+n-2)}, b_k) - r(x_{1(j+1)}, x_{2(j+n-2)}, b_{(k-1)})]$$

and where  $r(x_1, x_2, b_0) = 0$

**1.5.2** The factor  $p(x_1, x_2)$  is to be calculated according to the formulae given in [1.5.3] to [1.5.5], with:

$J_{max}$  : Overall normalized max damage length

$$J_{max} = 10 / 33$$

$J_{kn}$  : Knuckle point in the distribution

$$J_{kn} = 5 / 33$$

$p_k$  : Cumulative probability at  $J_{kn}$

$$p_k = 11 / 12$$

$\ell_{max}$  : Maximum absolute damage length

$$\ell_{max} = 60 \text{ m}$$

$L^*$  : Length where normalized distribution ends

$$L^* = 260 \text{ m}$$

$b_0$  : Probability density at  $J = 0$

$$b_0 = 2 \left( \frac{p_k}{J_{kn}} - \frac{1 - p_k}{J_{max} - J_{kn}} \right)$$

• when  $L_s \leq L^*$ :

$$J_m = \min \left\{ J_{max}, \frac{\ell_{max}}{L_s} \right\}$$

$$J_k = \frac{J_m}{2} + \frac{1 - \sqrt{1 + (1 - 2p_k)b_0 \cdot J_m + \frac{1}{4}b_0^2 \cdot J_m^2}}{b_0}$$

$$b_{12} = b_0$$

• when  $L_s > L^*$ :

$$J_m^* = \min \left\{ J_{max}, \frac{\ell_{max}}{L^*} \right\}$$

$$J_k^* = \frac{J_m^*}{2} + \frac{1 - \sqrt{1 + (1 - 2p_k)b_0 \cdot J_m^* + \frac{1}{4}b_0^2 \cdot J_m^{*2}}}{b_0}$$

$$J_m = \frac{J_m^* \cdot L^*}{L_s}$$

$$J_k = \frac{J_k^* \cdot L^*}{L_s}$$

$$b_{12} = 2 \left( \frac{p_k}{J_k} - \frac{1 - p_k}{J_m - J_k} \right)$$

$$b_{11} = 4 \frac{1 - p_k}{(J_m - J_k)J_k} - 2 \frac{p_k}{J_k^2}$$

$$b_{21} = -2 \frac{1 - p_k}{(J_m - J_k)^2}$$

$$b_{22} = -b_{21} \cdot J_m$$

$J$  : Non-dimensional damage length:

$$J = \frac{x_2 - x_1}{L_s}$$

$J_n$  : Normalized length of a compartment or group of compartments, to be taken as the lesser of  $J$  and  $J_m$ .

**1.5.3** Where neither limit of the compartment or group of compartments under consideration coincides with the aft or forward terminals:

- $J \leq J_k$ :

$$p(x_1, x_2) = p_1 = \frac{1}{6} J^2 (b_{11} \cdot J + 3b_{12})$$

- $J > J_k$ :

$$p(x_1, x_2) = p_2 = -\frac{b_{11} \cdot J_k^3}{3} + \frac{(b_{11} \cdot J - b_{12})J_k^2}{2} + b_{12} \cdot J \cdot J_k - \frac{b_{21}(J_n^3 - J_k^3)}{3} + \frac{(b_{21} \cdot J - b_{22})(J_n^2 - J_k^2)}{2} + b_{22} \cdot J(J_n - J_k)$$

**1.5.4** Where the aft limit of the compartment or group of compartments under consideration coincides with the aft terminal or the forward limit of the compartment or group of compartments under consideration coincides with the forward terminal:

- $J \leq J_k$ :

$$p(x_1, x_2) = \frac{1}{2}(p_1 + J)$$

- $J > J_k$ :

$$p(x_1, x_2) = \frac{1}{2}(p_2 + J)$$

**1.5.5** Where the compartment or group of compartments considered extends over the entire subdivision length ( $L_s$ ):

$$p(x_1, x_2) = 1$$

**1.5.6** The factor  $r(x_1, x_2, b)$  is to be determined by the following formula:

$$r(x_1, x_2, b) = 1 - (1 - C) \cdot \left[ 1 - \frac{G}{p(x_1, x_2)} \right]$$

where:

$$C = 12J_b(-45J_b + 4)$$

$$\text{with } J_b = b / (15 B)$$

- where the compartment or group of compartments considered extends over the entire subdivision length ( $L_s$ ):

$$G = G_1 = \frac{1}{2} b_{11} \cdot J_b^2 + b_{12} \cdot J_b$$

- where neither limit of the compartment or group of compartments under consideration coincides with the aft or forward terminals:

$$G = G_2 = -\frac{1}{3}b_{11} \cdot J_0^3 + \frac{1}{2}(b_{11} \cdot J - b_{12})J_0^2 + b_{12} \cdot J \cdot J_0$$

with  $J_0 = \min(J, J_b)$

- where the aft limit of the compartment or group of compartments under consideration coincides with the aft terminal or the forward limit of the compartment or group of compartments under consideration coincides with the forward terminal:

$$G = \frac{1}{2}(G_2 + G_1 \cdot J)$$

## 1.6 Calculation of factor $s_i$

**1.6.1** The factor  $s_i$  is to be determined for each case of assumed flooding involving a compartment or group of compartments according to the requirement indicated in [1.6.2] to [1.6.12] and the following notations:

$\theta_e$  : Equilibrium heel angle in any stage of flooding, in degrees

$\theta_v$  : Angle, in any stage of flooding, where the righting lever becomes negative, or the angle at which an opening incapable of being closed weathertight becomes submerged

$GZ_{max}$  : Maximum positive righting lever, in metres, up to the angle  $\theta_v$

Range : Range of positive righting levers, in degrees, measured from the angle  $\theta_e$ . The positive range is to be taken up to the angle  $\theta_v$

Flooding stage is any discrete step during the flooding process, including the stage before equalization (if any) until final equilibrium has been reached.

**1.6.2** The factor  $s_v$  for any damage case at any initial loading condition,  $d_v$ , shall be obtained from the formula:

$$s_i = \min[s_{intermediate,i}, s_{final,i}]$$

where:

$s_{intermediate,i}$ : The probability to survive all intermediate flooding stages until the final equilibrium stage, calculated in accordance with [1.6.3]

$s_{final,i}$  : The probability to survive in the final equilibrium stage of flooding, calculated in accordance with [1.6.4].

### 1.6.3 Calculation of $s_{intermediate}$

- For cargo ships fitted with cross-flooding devices, the factor  $s_{intermediate,i}$  is to be taken as the least of the s-factors obtained from all flooding stages including the stage before equalization, if any, and is to be calculated as follows:

$$s_{intermediate,i} = \left( \frac{GZ_{max}}{0,05} \cdot \frac{Range}{7} \right)^{\frac{1}{4}}$$

where  $GZ_{max}$  is not to be taken as more than 0,05 m and Range as not more than 7°.

$s_{intermediate} = 0$ , if the intermediate heel angle exceeds 30°.

- For cargo ships not fitted with cross-flooding devices the factor  $s_{intermediate,i}$  is taken as unity, except if the Society considers that the stability in intermediate stages of flooding may be insufficient. It should require further investigation thereof.

Where cross-flooding fittings are required, the time for equalization is not to exceed 10 min. The time for equalization is to be calculated in accordance with Pt D, Ch 11, App 1.

### 1.6.4 Calculation of $s_{final}$

The factor  $s_{final,i}$  is to be obtained from the formula:

$$s_{final,i} = K \left( \frac{GZ_{max}}{TGZ_{max}} \cdot \frac{Range}{TRange} \right)^{\frac{1}{4}}$$

where:

$GZ_{max}$  is not to be taken as more than  $TGZ_{max}$

Range is not to be taken as more than TRange.

$TGZ_{max} = 0,12$  m

TRange = 16°

K is to be taken equal to:

- $K = 1$  if  $\theta_e \leq \theta_{\min}$
- $K = 0$  if  $\theta_e \geq \theta_{\max}$
- $K = \frac{\theta_{\max} - \theta_e}{\theta_{\max} - \theta_{\min}}$  otherwise

$\theta_{\min}$  is equal to  $25^\circ$

$\theta_{\max}$  is equal to  $30^\circ$ .

**1.6.5 Cases where  $s_i$  is taken as zero**

- a) The factor  $s_i$  is to be taken as zero in those cases where the final waterline, taking into account sinkage, heel and trim, immerses:
- the lower edge of openings through which progressive flooding may take place and such flooding is not accounted for in the calculation of factor  $s_i$ . Such openings are to include air-pipes, ventilators and openings that are closed by means of weathertight doors or hatch covers, but the openings closed by means of watertight manhole covers and flush scuttles, small watertight hatch covers, remotely operated sliding watertight doors, hinged watertight access doors with open/closed indication locally and at the navigation bridge, of the quick-acting or single-action type that are normally closed at sea, hinged watertight doors that are permanently closed at sea, side scuttles of the non-opening type as well as watertight access doors and hatch covers required to be kept closed at sea need not be considered.
  - any part of the bulkhead deck considered a horizontal evacuation route.
- b) The factor  $s_i$  is to be taken as zero if, taking into account sinkage, heel and trim, any of the following occur in any intermediate stage or in the final stage of flooding:
- immersion of any vertical escape hatch in the freeboard deck of cargo ships intended for compliance with the applicable requirements of Pt C, Ch 4, Sec 8
  - any controls intended for the operation of watertight doors, equalization devices, valves on piping or on ventilation ducts intended to maintain the integrity of watertight bulkheads from above the freeboard deck of cargo ships become inaccessible or inoperable
  - immersion of any part of piping or ventilation ducts located within the assumed extent of damage and carried through a watertight boundary if this can lead to the progressive flooding of compartment not assumed as flooded.

**1.6.6** The ship is to be so designed that  $s_i$ , calculated in accordance with [1.6.1] will not be less than 1 at the deepest subdivision draught loading condition, level trim or any forward trim loading conditions, if any part of the ship forward of the collision bulkhead is flooded without vertical limits.

**1.6.7** Unsymmetrical flooding is to be kept to a minimum consistent with the efficient arrangements. Where it is necessary to correct large angles of heel, the means adopted are, where practicable, to be self-acting, but in any case where controls to equalization devices are provided they are to be operable from above the freeboard deck of cargo ships. These fittings, together with their controls, are to be acceptable to the Society. Suitable information concerning the use of equalization devices are to be supplied to the master of the ship.

**1.6.8** Tanks and compartments taking part in such equalization are to be fitted with air pipes or equivalent means of sufficient cross-section to ensure that the flow of water into the equalization compartments is not delayed.

**1.6.9** Where horizontal watertight boundaries are fitted above the waterline under consideration, the  $s$ -value calculated for the lower compartment or group of compartments is to be obtained by multiplying the value as determined in [1.6.2] by the reduction factor  $v_m$  according to [1.6.10], which represents the probability that the spaces above the horizontal subdivision will not be flooded.

**1.6.10** The factor  $v_m$  is to be obtained from the following formula:

$$v_m = v(H_{j,n,m}, d) - v(H_{j,n,m-1}, d)$$

where:

- $H_{j,n,m}$  : Least height above the baseline, in metres, within the longitudinal range of  $x_1(j) \dots x_2(j+n-1)$  of the  $m^{\text{th}}$  horizontal boundary which is assumed to limit the vertical extent of flooding for the damaged compartments under consideration
- $H_{j,n,m-1}$  : Least height above the baseline, in metres, within the longitudinal range of  $x_1(j) \dots x_2(j+n-1)$  of the  $(m-1)^{\text{th}}$  horizontal boundary which is assumed to limit the vertical extent of flooding for the damaged compartments under consideration
- $j$  : The aft terminal of the damaged compartments under consideration
- $m$  : Each horizontal boundary counted upwards from the waterline under consideration
- $d$  : Draught in question, as defined in [1.2]
- $x_1, x_2$  : Terminals of the compartment or group of compartments considered in [1.5.1].

**1.6.11** The factors  $v(H_{j,n,m}, d)$  and  $v(H_{j,n,m-1}, d)$  are to be obtained from the following formulae:

- if  $(H_m - d) \leq 7,8 \text{ m}$ :

$$v(H, d) = 0,8 \frac{(H-d)}{7,8}$$

- in all other cases:

$$v(H, d) = 0,8 + 0,2 \left[ \frac{(H-d) - 7,8}{4,7} \right]$$

where:

- $v(H_{j,n,m}, d)$  is to be taken as 1, if  $H_m$  coincides with the uppermost watertight boundary of the ship within the range  $(X_{1(j)} \dots X_{2(j+n-1)})$
- $v(H_{j,n,0}, d)$  is to be taken as 0.

In no case is  $v_m$  to be taken as less than zero or more than 1.

**1.6.12** In general, each contribution  $dA$  to the index  $A$  in the case of horizontal subdivisions is obtained from the following formula:

$$dA = p_i \cdot [v_1 \cdot s_{\min 1} + (v_2 - v_1) \cdot s_{\min 2} + \dots + (1 - v_{m-1}) \cdot s_{\min m}]$$

where:

$v_m$  : The v-value calculated in accordance with [1.6.10] and [1.6.11]

$s_{\min}$  : The least s-factor for all combinations of damages obtained when the assumed damage extends from the assumed damage height  $H_m$  downwards.

## 1.7 Permeability

**1.7.1** For the purpose of the subdivision and damage stability calculations reported in this Appendix, the permeability of each space or part of a space is to be as per Tab 1.

**Table 1 : Permeability**

Spaces	Permeability
Appropriated to stores	0,60
Occupied by accommodations	0,95
Occupied by machinery	0,85
Void spaces	0,95
Intended for liquids	0 or 0,95 <b>(1)</b>
<b>(1)</b> whichever results in the more severe requirements	

**1.7.2** For the purpose of the subdivision and damage stability calculations reported in this Appendix, the permeability of each cargo compartment is to be as per Tab 2.

Other figures for permeability may be used if substantiated by calculations.

**Table 2 : Permeability of cargo compartments**

Spaces	Permeability at draught		
	$d_s$	$d_p$	$d_l$
Dry cargo spaces	0,70	0,80	0,95
Container spaces	0,70	0,80	0,95
Ro-ro spaces	0,90	0,90	0,95
Cargo liquids	0,70	0,80	0,95

## 1.8 Stability information

**1.8.1** The master is to be supplied with such information satisfactory to the Society as is necessary to enable him by rapid and simple processes to obtain accurate guidance as to the stability of the ship under varying conditions of service. A copy of the stability information is to be furnished to the Society.

**1.8.2 Information to be submitted**

The information is to include:

- curves or tables of minimum operational metacentric height ( $GM$ ) versus draught which assures compliance with the relevant intact and damage stability requirements, alternatively corresponding curves or tables of the maximum allowable vertical centre of gravity ( $KG$ ) versus draught, or with the equivalents of either of these curves
- instructions concerning the operation of cross-flooding arrangements, and
- all other data and aids which might be necessary to maintain the required intact stability and stability after damage.

**1.8.3** The stability information is to show the influence of various trims in cases where the operational trim range exceeds  $\pm 0,5\%$  of  $L_s$ .

**1.8.4** For ships which have to fulfil the stability requirements of this Annex, information referred to in [1.8.2] is determined from considerations related to the subdivision index, in the following manner: Minimum required  $GM$  (or maximum permissible vertical position of centre of gravity  $KG$ ) for the three draughts  $d_s$ ,  $d_p$  and  $d_l$  are equal to the  $GM$  (or  $KG$  values) of corresponding loading cases used for the calculation of survival factor  $s_i$ . For intermediate draughts, values to be used are to be obtained by linear interpolation applied to the  $GM$  value only between the deepest subdivision draught and the partial subdivision draught and between the partial load line and the light service draught respectively. Intact stability criteria are also to be taken into account by retaining for each draught the maximum among minimum required  $GM$  values or the minimum of maximum permissible  $KG$  values for both criteria. If the subdivision index is calculated for different trims, several required  $GM$  curves are to be established in the same way.

**1.8.5** When curves or tables of minimum operational metacentric height ( $GM$ ) versus draught are not appropriate, the master is to ensure that the operating condition does not deviate from a studied loading condition, or verify by calculation that the stability criteria are satisfied for this loading condition.

# Appendix 4 Damage Stability Calculation for Ships Assigned with a Reduced Freeboard

## 1 Application

### 1.1 General

1.1.1 The requirements of this Appendix apply to:

- Type A ships having a length greater than 150 m, and
- Type B-60 ships and Type B-100 ships having a length greater than 100 m.

Any reference hereafter to regulations refers to the set of regulations contained in this Appendix.

## 2 Initial loading condition

### 2.1 Initial condition of loading

2.1.1 *The initial condition of loading before flooding is to be determined according to [2.1.2] and [2.1.3].*

2.1.2 *The ship is loaded to its summer load waterline on an imaginary even keel.*

2.1.3 *When calculating the vertical centre of gravity, the following principles apply:*

- Homogeneous cargo is carried.*
- All cargo compartments, except those referred to under c), but including compartments intended to be partially filled, are to be considered fully loaded except that in the case of fluid cargoes each compartment is to be treated as 98 per cent full.*
- If the ship is intended to operate at its summer load waterline with empty compartments, such compartments are to be considered empty provided the height of the centre of gravity so calculated is not less than as calculated under b).*
- Fifty per cent of the individual total capacity of all tanks and spaces fitted to contain consumable liquids and stores is allowed for. It is to be assumed that for each type of liquid, at least one transverse pair or a single centre line tank has maximum free surface, and the tank or combination of tanks to be taken into account are to be those where the effect of free surfaces is the greatest; in each tank the centre of gravity of the contents is to be taken at the centre of volume of the tank. The remaining tanks are to be assumed either completely empty or completely filled, and the distribution of consumable liquids between these tanks is to be effected so as to obtain the greatest possible height above the keel for the centre of gravity.*
- At an angle of heel of not more than 5 degrees in each compartment containing liquids, as prescribed in b) except that in the case of compartments containing consumable fluids, as prescribed in d), the maximum free surface effect is to be taken into account.*

*Alternatively, the actual free surface effects may be used, provided the methods of calculation are acceptable to the Society.*

- Weights are to be calculated on the basis of Tab 1.*

**Table 1 : Specific gravities**

Weight item	Specific gravity, in t/m <sup>3</sup>
Salt water	1,025
Fresh water	1,000
Fuel oil	0,950
Diesel oil	0,900
Lubricating oil	0,900

## 3 Damage assumptions

### 3.1 Damage dimension

3.1.1 *The principles indicated in [3.1.2] to [3.1.5] regarding the character of the assumed damage apply.*

3.1.2 *The vertical extent of damage in all cases is assumed to be from the base line upwards without limit.*

**3.1.3** The transverse extent of damage is equal to  $B/5$  or 11,5 metres, whichever is the lesser, measured inboard from the side of the ship perpendicularly to the centre line at the level of the summer load waterline.

**3.1.4** If damage of a lesser extent than specified in [3.1.2] and [3.1.3] results in a more severe condition, such lesser extent is to be assumed.

**3.1.5** Except where otherwise required in [3.4.3], the flooding is to be confined to a single compartment between adjacent transverse bulkheads provided the inner longitudinal boundary of the compartment is not in a position within the transverse extent of assumed damage. Transverse boundary bulkheads of wing tanks, which do not extend over the full breadth of the ship are to be assumed not to be damaged, provided they extend beyond the transverse extent of assumed damage prescribed in [3.1.3].

**3.2 Steps and recesses**

**3.2.1** If in a transverse bulkhead there are steps or recesses of not more than 3,05 metres in length located within the transverse extent of assumed damage as defined in [3.1.3], such transverse bulkhead may be considered intact and the adjacent compartment may be floodable singly. If, however, within the transverse extent of assumed damage there is a step or recess of more than 3,05 metres in length in a transverse bulkhead, the two compartments adjacent to this bulkhead are to be considered as flooded. The step formed by the after peak bulkhead and the after peak tank top is not to be regarded as a step for the purpose of this regulation.

**3.2.2** Where a main transverse bulkhead is located within the transverse extent of assumed damage and is stepped in way of a double bottom or side tank by more than 3,05 metres, the double bottom or side tanks adjacent to the stepped portion of the main transverse bulkhead are to be considered as flooded simultaneously. If this side tank has openings into one or several holds, such as grain feeding holes, such hold or holds are to be considered as flooded simultaneously. Similarly, in a ship designed for the carriage of fluid cargoes, if a side tank has openings into adjacent compartments, such adjacent compartments are to be considered as empty and flooded simultaneously. This provision is applicable even where such openings are fitted with closing appliances, except in the case of sluice valves fitted in bulkheads between tanks and where the valves are controlled from the deck. Manhole covers with closely spaced bolts are considered equivalent to the unpierced bulkhead except in the case of openings in topside tanks making the topside tanks common to the holds.

**3.2.3** Where a transverse bulkhead forming the forward or aft limit of a wing tank or double bottom tank is not in line with the main transverse bulkhead of the adjacent inboard compartment, it is considered to form a step or recess in the main transverse bulkhead.

Such a step or recess may be assumed not to be damaged provided that, either:

- the longitudinal extent of the step or recess, measured from the plan of the main transverse bulkhead, is not more than 3,05 metres, or
- any longitudinal surface forming the step or recess is located inboard of the assumed damage.

**3.2.4** Where, otherwise, the transverse and longitudinal bulkheads bounding a main inboard compartment are entirely inboard of the assumed damage position, damage is assumed to occur between the transverse bulkheads and the adjacent wing compartment. Any step or recess in such wing tank is to be treated as indicated above.

Examples are shown in Fig 1 to Fig 4:

- Fig 1 and Fig 2 refer to [3.2.2]
- Fig 3 and Fig 4 refer to [3.2.1] and [3.2.2].

**Figure 1 : Step and recesses - Example 1**

Compartments to be considered damaged simultaneously  
 A + D  
 B + E  
 C + E + F

Figure 2 : Step and recesses - Example 2

Figure 3 : Step and recesses - Example 3

Figure 4 : Step and recesses - Example 4

**3.3 Transverse bulkhead spacing**

**3.3.1** Where the flooding of any two adjacent fore and aft compartments is envisaged, main transverse watertight bulkheads are to be spaced at least  $1/3(L)^{2/3}$  or 14,5 metres, whichever is the lesser, in order to be considered effective. Where transverse bulkheads are spaced at a lesser distance, one or more of these bulkheads are to be assumed as non-existent in order to achieve the minimum spacing between bulkheads.

**3.4 Damage assumption**

**3.4.1** A Type A ship, if over 150 metres in length to which a freeboard less than Type B has been assigned, when loaded as considered in [2.1], is to be able to withstand the flooding of any compartment or compartments, with an assumed permeability of 0,95, consequent upon the damage assumptions specified in [3.1], and is to remain afloat in a satisfactory condition of equilibrium as specified in [3.5] and [3.6]. In such a ship, the machinery space is to be treated as a floodable compartment, but with a permeability of 0,85. See Tab 2.

**3.4.2** A Type B-60 ship, when loaded as considered in [2.1], is to be able to withstand the flooding of any compartment or compartments, with an assumed permeability of 0,95, consequent upon the damage assumptions specified in [3.1], and is to remain afloat in a satisfactory condition of equilibrium as specified in [3.5] and [3.6]. In such a ship, if over 150 metres in length, the machinery space is to be treated as a floodable compartment, but with a permeability of 0,85. See Tab 2.

**3.4.3** A Type B-100 ship, when loaded as considered in [2.1], is to be able to withstand the flooding of any compartment or compartments, with an assumed permeability of 0,95, consequent upon the damage assumptions specified in [3.1], and is to remain afloat in a satisfactory condition of equilibrium as specified in [3.5] and [3.6]. Furthermore all the requirements stated in [4.1] are to be complied with, provided that throughout the length of the ship any one transverse bulkhead will be assumed to be damaged, such that two adjacent fore and aft compartments are to be flooded simultaneously, except that such damage will not apply to the boundary bulkheads of a machinery space. In such a ship, if over 150 metres in length, the machinery space is to be treated as a floodable compartment, but with a permeability of 0,85. See Tab 2.

**Table 2 : Damage assumption**

Type	L, in m	Standard of flooding (1)
A	≥ 150	one compartment
B - 60	≥ 100	one compartment
B -100	≥ 100	two adjacent compartments (exemption for machinery space which is to be flooded alone)
(1) except where otherwise required by [4.2].		

**3.5 Condition of equilibrium**

**3.5.1** The condition of equilibrium after flooding is to be regarded as satisfactory according to [3.5.2] and [3.5.3].

**3.5.2** The final waterline after flooding, taking into account sinkage, heel and trim, is below the lower edge of any opening through which progressive downflooding may take place. Such openings are to include air pipes, ventilators and openings that are closed by means of weathertight doors or hatch covers, unless closed by watertight gasketed covers of steel or equivalent material, and may exclude those openings closed by means of manhole covers and flush scuttles, cargo hatch covers, remotely operated sliding watertight doors, hinged watertight access doors with open/closed indication locally and at the navigation bridge, of the quick-acting or single-action type that are normally closed at sea, hinged watertight doors that are permanently closed at sea, and side scuttles of the non-opening type. However, in the case of doors separating a main machinery space from a steering gear compartment, watertight doors may be of a hinged, quick acting type kept closed at sea, whilst not in use, provided also that the lower sill of such doors is above the summer load waterline.

**3.5.3** If pipes, ducts or tunnels are situated within the assumed extent of damage penetration as defined in [3.1.3], arrangements are to be made so that progressive flooding cannot thereby extend to compartments other than those assumed to be floodable in the calculation for each case of damage.

**3.6 Damage stability criteria**

**3.6.1** The angle of heel due to unsymmetrical flooding does not exceed 15 degrees. If no part of the deck is immersed, an angle of heel of up to 17 degrees may be accepted.

**3.6.2** The metacentric height in the flooded condition is positive.

**3.6.3** When any part of the deck outside the compartment assumed flooded in a particular case of damage is immersed, or in any case where the margin of stability in the flooded condition may be considered doubtful, the residual stability is to be investigated. It may be regarded as sufficient if the righting lever curve has a minimum range of 20 degrees beyond the position of equilibrium with a maximum righting lever of at least 0,1 metre within this range. The area under the righting lever curve within this range is to be not less than 0,0175 metre-radians. The Society is to give consideration to the potential hazard presented by protected or unprotected openings which may become temporarily immersed within the range of residual stability.

**3.6.4** The Society is satisfied that the stability is sufficient during intermediate stages of flooding. In this regard, the Society will apply the same criteria relevant to the final stage, also during the intermediate stages of flooding.

## **4 Requirements for Type B-60 and B-100 ships**

### **4.1 Requirements for Type B-60 ships**

**4.1.1** Any Type B ships of over 100 metres, having hatchways closed by weathertight covers as specified in [4.3], may be assigned freeboards less than those required for Type B, provided that, in relation to the amount of reduction granted, the requirements in [4.1.2] to [4.1.4] are considered satisfactory by the Society.

In addition, the requirements stated in [3.4.2] are to be complied with.

**4.1.2** The measures provided for the protection of the crew are to be adequate.

**4.1.3** The freeing arrangements are to comply with the provisions of Ch 11, Sec 12.

**4.1.4** The covers in positions 1 and 2 comply with the provisions of [4.3] and have strength complying with Ch 11, Sec 9, special care being given to their sealing and securing arrangements.

### **4.2 Requirements for Type B-100 ships**

**4.2.1** In addition to the requirements specified in [4.1], not taking into account the prescription stated in [3.4.2], the requirements in [4.2.2] to [4.2.4] are to be complied with.

In addition, the provisions of [3.4.3] are to be complied with.

#### **4.2.2 Machinery casings**

Machinery casings on Type A ships are to be protected by an enclosed poop or bridge of at least standard height, or by a deckhouse of equal height and equivalent strength, provided that machinery casings may be exposed if there are no openings giving direct access from the freeboard deck to the machinery space. A door complying with the requirements of [4.4] may, however, be permitted in the machinery casing, provided that it leads to a space or passageway which is as strongly constructed as the casing and is separated from the stairway to the engine room by a second weathertight door of steel or other equivalent material.

#### **4.2.3 Gangway and access**

An efficiently constructed fore and aft permanent gangway of sufficient strength is to be fitted on Type A ships at the level of the superstructure deck between the poop and the midship bridge or deckhouse where fitted, or equivalent means of access is to be provided to carry out the purpose of the gangway, such as passages below deck. Elsewhere, and on Type A ships without a midship bridge, arrangements to the satisfaction of the Society are to be provided to safeguard the crew in reaching all parts used in the necessary work of the ship.

Safe and satisfactory access from the gangway level is to be available between separate crew accommodation spaces and also between crew accommodation spaces and the machinery space.

#### **4.2.4 Freeing arrangements**

Type A ships with bulwarks are to be provided with open rails fitted for at least half the length of the exposed parts of the weather deck or other effective freeing arrangements. The upper edge of the sheer strake is to be kept as low as practicable.

Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed parts of the freeboard deck.

### **4.3 Hatchways closed by weathertight covers of steel or other equivalent material fitted with gaskets and clamping devices**

**4.3.1** At positions 1 and 2 the height above the deck of hatchway coamings fitted with weathertight hatch covers of steel or other equivalent material fitted with gaskets and clamping devices is to be:

- 600 millimetres if in position 1
- 450 millimetres if in position 2.

The height of these coamings may be reduced, or the coamings omitted entirely, upon proper justification. Where coamings are provided they are to be of substantial construction.

**4.3.2** *Where weathertight covers are of mild steel the strength is to be calculated with assumed loads not less than those specified in Ch 11, Sec 9.*

**4.3.3** *The strength and stiffness of covers made of materials other than mild steel are to be equivalent to those of mild steel to the satisfaction of the Society.*

**4.3.4** *The means for securing and maintaining weathertightness are to be to the satisfaction of the Society. The arrangements are to ensure that the tightness can be maintained in any sea conditions, and for this purpose tests for tightness are required at the initial survey, and may be required at periodical surveys and at annual inspections or at more frequent intervals.*

### 4.4 Doors

**4.4.1** *All access openings in bulkheads at ends of enclosed superstructures are to be fitted with doors of steel or other equivalent material, permanently and strongly attached to the bulkhead, and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead and weathertight when closed. The means for securing these doors weathertight are to consist of gaskets and clamping devices or other equivalent means and are to be permanently attached to the bulkhead or to the doors themselves, and the doors are to be so arranged that they can be operated from both sides of the bulkhead.*

**4.4.2** *Except as otherwise provided, the height of the sills of access openings in bulkheads at ends of enclosed superstructures is to be at least 380 millimetres above the deck.*

# Part B

## Hull and Stability

---

### CHAPTER 4

## STRUCTURE DESIGN PRINCIPLES

---

Section 1	Materials
Section 2	Net Scantling Approach
Section 3	Corrosion Additions
Section 4	Protection of Hull Metallic Structures
Section 5	Structural Detail Principles
Section 6	Structural Idealisation

# Section 1 Materials

## 1 General

### 1.1 Standard of material

1.1.1 Materials used during construction are to comply with the applicable requirements of NR216 Materials and Welding.

1.1.2 Materials other than those covered in [1.1.1] may be accepted, provided their specification (e.g. manufacture, chemical composition, mechanical properties, welding) is submitted to the Society for approval.

### 1.2 Testing of materials

1.2.1 Materials are to be tested in compliance with the applicable requirements of NR216 Materials and Welding.

### 1.3 Manufacturing process

1.3.1 The requirements of this Section presume that welding and other cold or hot manufacturing processes are carried out in compliance with current sound working practice and with the applicable requirements of NR216 Materials and Welding.

In particular:

- parent material and welding processes are to be within the limits stated for the specified type of material for which they are intended
- specific preheating may be required before welding
- welding or other cold or hot manufacturing processes may need to be followed by an adequate heat treatment.

## 2 Hull structural steel

### 2.1 General

#### 2.1.1 Young's modulus and Poisson's ratio

For carbon steel materials, Young's modulus is equal to 206000 N/mm<sup>2</sup> and Poisson's ratio is equal to 0,3.

In case of steel used at a temperature  $\theta$  between 90°C and 300°C, and when no other information is available, the minimum specified yield stress  $R_{eH}$  and the Young's modulus  $E$  of the steel at the temperature  $\theta$  may be taken respectively equal to:

$$R_{eH} = R_{eH0} \left( 1,04 - \frac{0,75}{1000} \theta \right)$$

$$E = E_0 \left( 1,03 - \frac{0,5}{1000} \theta \right)$$

where:

- $R_{eH0}$  : Value of the minimum specified yield stress at ambient temperature, in N/mm<sup>2</sup>
- $E_0$  : Value of the Young's modulus at ambient temperature, in N/mm<sup>2</sup>
- $\theta$  : Temperature of use of the steel, in °C.

#### 2.1.2 Steel material grades and mechanical properties

Steel having a specified minimum yield stress equal to 235 N/mm<sup>2</sup> is regarded as normal strength steel and is denoted 'NSS'. Steel having a higher specified minimum yield stress is regarded as higher strength steel and is denoted 'HSS'.

Steel grades are referred to as follows:

- A, B, D and E denote normal strength steel grades
- AH, DH and EH denote higher strength steel grades.

Tab 1 gives the mechanical characteristics of steels generally used in the construction of ships.

Higher strength steels other than those indicated in Tab 1 are considered by the Society on a case-by-case basis.

#### 2.1.3 Steels with through thickness properties

Characteristics of steels with specified through thickness properties are given in NR216 Materials and Welding, Ch 3, Sec 1, [1].

**2.1.4 Onboard documents**

It is advised to keep onboard a plan indicating the steel types and grades adopted for the hull structures. Where steels other than those indicated in Tab 1 are used, their mechanical and chemical properties, as well as any workmanship requirements or recommendations, are to be available onboard together with the above plan.

**Table 1 : Mechanical properties of hull steels**

Steel grades for plates with $t_{as\_built} \leq 100$ mm	Specified minimum yield stress $R_{eH}$ in N/mm <sup>2</sup>	Specified minimum tensile strength $R_m$ in N/mm <sup>2</sup>
A-B-D-E	235	400 - 520
AH32-DH32 EH32-FH32	315	440 - 570
AH36-DH36 EH36-FH36 EH36CAS1-EH36CAS2 FH36CAS1-FH36CAS2	355	490 - 630
AH40-DH40 EH40-FH40 EH40CAS1-EH40CAS2 FH40CAS1-FH40CAS2	390	510 - 660
EH47 EH47CAS1-FH47CAS2	460	570 - 720
<b>Note 1:</b> Refer to NR216 Materials and Welding, Ch 3, Sec 2		

**2.2 Material factor k**

**2.2.1** Unless otherwise specified, the material factor k of normal and higher strength steels for hull girder strength and scantling purposes is to be taken as given in Tab 2, as a function of the specified minimum yield stress  $R_{eH}$ .

For intermediate values of  $R_{eH}$ , k is obtained by linear interpolation.

Steels with a yield stress lower than 235 N/mm<sup>2</sup> or greater than 460 N/mm<sup>2</sup> are considered on a case by case basis by the Society.

**Table 2 : Material factor k**

$R_{eH}$ , in N/mm <sup>2</sup>	k
235	1,00
315	0,78
355	0,72
390	0,68 <b>(1)</b>
460	0,62
<b>(1)</b> k may be taken equal to 0,66 for steels with a minimum yield stress $R_{eH}$ equal to 390 N/mm <sup>2</sup> , provided the hull structure is additionally verified for compliance with finite element analysis and spectral fatigue assessment according to NI611.	

**2.3 Steel grades**

**2.3.1** Materials in the various strength members are not to be of lower grade than those corresponding to the material classes and grades specified in Tab 3 to Tab 9.

General requirements are given in Tab 3. Additional minimum requirements are given in:

- Tab 4 for ships, excluding membrane-type liquefied gas carriers, greater than 150 m in length and having a single strength deck
- Tab 5 for membrane type liquefied gas carriers greater than 150 m in length and having a deck arrangement as shown in Fig 1. Tab 5 may apply to similar ships with a double deck arrangement above the strength deck.
- Tab 6 for ships greater than 250 m in length
- Tab 7 for single-side **bulk carriers, bulk carriers ESP, self-unloading bulk carriers ESP, ore carrier ESP and combination carrier / OBO ESP**
- Tab 8 for ships with ice strengthening.

**2.3.2** Materials are to be of a grade not lower than that indicated in Tab 9 depending on the material class and structural member gross thickness (see [2.3.5]).

Figure 1 : Typical deck arrangement for membrane-type liquefied natural gas carriers

**2.3.3** For strength members not mentioned in Tab 3, Tab 4, Tab 5, Tab 6, Tab 7 and Tab 8, grade A/AH may generally be used.

**2.3.4** Plating materials for stern frames supporting the rudder and propeller boss, rudders, rudder horns and shaft brackets are generally to be of grades not lower than those corresponding to Class II.

For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders), Class III is to be applied.

**2.3.5** The steel grade is to correspond to the as fitted gross thickness when this is greater than the gross thickness obtained from the net thickness required by the Rules, according to Ch 4, Sec 2, [1].

**2.3.6** Steel grades of plates or sections of gross thickness greater than the limiting thicknesses in Tab 9 are considered by the Society on a case by case basis.

**2.3.7** In specific cases, such as [2.3.8], with regard to stress distribution along the hull girder, the classes required within 0,4L amidships may be extended beyond that zone, on a case by case basis.

**2.3.8** The material classes required for the strength deck plating, the sheer strake and the upper strake of longitudinal bulkheads within 0,4L amidships are to be maintained for an adequate length across the poop front and at the ends of the bridge, where fitted.

**2.3.9** Rolled products used for welded attachments on hull plating, such as gutter bars are to be of the same grade as that used for the hull plating in way.

Where it is necessary to weld attachments to the sheer strake or stringer plate, attention is to be given to the appropriate choice of material and design, the workmanship and welding and the absence of prejudicial undercuts and notches, with particular regard to any free edges of the material.

**2.3.10** In the case of full penetration welded joints located in positions where high local stresses may occur perpendicular to the continuous plating, the Society may, on a case by case basis, require the use of rolled products having adequate ductility properties in the through thickness direction, such as to minimize the risk of lamellar tearing (Z type steel, see NR216 Materials and Welding).

**2.3.11** In highly stressed areas, the Society may require that plates of gross thickness greater than 20 mm are of grade D/DH or E/EH.

## 2.4 Grades of steel for structures exposed to low air temperatures

**2.4.1** For ships intended to operate in areas with low air temperatures ( $-10^{\circ}\text{C}$  or below), e.g. regular service during winter seasons to Arctic or Antarctic waters (known as the Polar Regions), the materials in exposed structures are to be selected based on the design temperature  $t_D$ , to be taken as defined in [2.4.2].

**Table 3 : Material classes and grades for ships in general**

Structural member category		Material class or grade	
		Within 0,4L amidships	Outside 0,4L amidships
SECONDARY	<ul style="list-style-type: none"> <li>Longitudinal bulkhead strakes, other than that belonging to the primary category</li> <li>Deck plating exposed to weather, other than that belonging to the primary or special category</li> <li>Side plating</li> </ul>	I	A / AH
	<ul style="list-style-type: none"> <li>Bottom plating, including keel plate</li> <li>Strength deck plating, excluding that belonging to the special category</li> <li>Continuous longitudinal plating of strength members above strength deck, excluding hatch coamings, for ships equal to or greater than 90 m in length</li> <li>Uppermost strake in longitudinal bulkhead</li> <li>Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank</li> </ul>	II	A / AH
SPECIAL	<ul style="list-style-type: none"> <li>Sheer strake at strength deck <b>(1)</b></li> <li>Stringer plate in strength deck <b>(1)</b></li> <li>Deck strake at longitudinal bulkhead excluding deck plating in way of inner-skin bulkhead of double hull ships <b>(1)</b></li> </ul>	III	II I outside 0,6L amidships
	<ul style="list-style-type: none"> <li>Strength deck plating at outboard corners of cargo hatch openings in container carriers and other ships with similar hatch openings configurations</li> </ul>	III	II I outside 0,6L amidships Min. class III within cargo region
	<ul style="list-style-type: none"> <li>Strength deck plating at corners of cargo hatch openings in bulk carriers, ore carriers, combination carriers and other ships with similar hatch openings configurations</li> <li>Trunk deck and inner deck plating at corners of openings for liquid and gas domes in membrane type liquefied gas carriers</li> </ul>	III	III within 0,6L amidships II within the rest of cargo region
	<ul style="list-style-type: none"> <li>Bilge strake in ships with double bottom over the full breadth and length less than 150 m</li> </ul>	II	II within 0,6L amidships I outside 0,6L amidships
	<ul style="list-style-type: none"> <li>Bilge strake in other ships <b>(1)</b></li> </ul>	III	II I outside 0,6L amidships
	<ul style="list-style-type: none"> <li>Longitudinal hatch coamings of length greater than 0,15 L, including top plate and flange, for ships equal to or greater than 90 m in length</li> <li>End brackets and deck house transition of longitudinal cargo hatch coamings</li> </ul>	III Not to be less than grade D/DH	II I outside 0,6L amidships Not to be less than grade D/DH
<b>(1)</b> Single strakes required to be of class III within 0.4L amidships are to have breadths not less than (800 + 5 L) mm, need not to be greater than 1800 mm, unless limited by the geometry of the ship's design.			

**Table 4 : Minimum material grades for ships greater than 150 m in length**

Structural member category	Material grade
<ul style="list-style-type: none"> <li>Longitudinal plating of strength deck where contributing to the longitudinal strength</li> <li>Continuous longitudinal plating of strength members above strength deck</li> </ul>	B/AH within 0,4 L amidships
<ul style="list-style-type: none"> <li>Single side strakes for ships without inner continuous longitudinal bulkhead(s) between the bottom and the strength deck</li> </ul>	B/AH within cargo region

**Table 5 : Material classes and grades for membrane-type liquefied gas carriers, greater than 150 m in length**

Structural member category		Material class or grade
Longitudinal plating of strength deck where contributing to the longitudinal strength		B/AH within 0,4 L amidships
Continuous longitudinal plating of strength members above the strength deck	Trunk deck plating	II within 0,4L amidships
	<ul style="list-style-type: none"> <li>Inner deck plating</li> <li>Longitudinal strength member plating between the trunk deck and the inner deck</li> </ul>	B/AH within 0,4 L amidships

**Table 6 : Minimum material grades for ships greater than 250 m in length**

Structural member category (1)	Material grade within 0,4 L amidships
<ul style="list-style-type: none"> <li>Sheer strake at strength deck</li> <li>Stringer plate in strength deck</li> </ul>	E/EH
<ul style="list-style-type: none"> <li>Bilge strake</li> </ul>	D/DH
(1) Single strakes required to be of grade D/DH or grade E/EH and within 0,4 L amidships are to have breadths not less than (800 + 5 L) mm, but need not be greater than 1800 mm, unless limited by the geometry of the ship's design.	

**Table 7 : Material classes and grades for single-side bulk carrier, bulk carrier ESP, self-unloading bulk carrier, ore carrier ESP and combination carrier / OBO ESP**

Structural member category	Material grade
Lower bracket of ordinary side frame (1) (2)	D/DH
Side shell strakes included totally or partially between the two points located to 0,125 ℓ above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate (2)	D/DH
(1) the term "lower bracket" means web of lower bracket and web of the lower part of side frames up the point of 0,125 ℓ above the intersection of side shell and bilge hopper sloping plate or inner bottom plate.	
(2) the span of the side frame, ℓ, is defined as the distance between the supporting structures.	

**Table 8 : Material classes and grades for ships with ice strengthening**

Structural member category	Material grade
Shell strakes in way of ice strengthening area for plates	B/AH

**Table 9 : Material grade requirements for classes I, II and III**

As-built thickness, in mm	Class I		Class II		Class III	
	NSS	HSS	NSS	HSS	NSS	HSS
t ≤ 15	A	AH	A	AH	A	AH
15 < t ≤ 20	A	AH	A	AH	B	AH
20 < t ≤ 25	A	AH	B	AH	D	DH
25 < t ≤ 30	A	AH	D	DH	D	DH
30 < t ≤ 35	B	AH	D	DH	E	EH
35 < t ≤ 40	B	AH	D	DH	E	EH
40 < t ≤ 50	D	DH	E	EH	E	EH

**2.4.2** The design temperature  $t_D$  is to be taken as the lowest mean daily average air temperature in the area of operation, where:

Mean : Statistical mean over observation period

Average : Average during one day and night

Lowest : Lowest during one year.

Fig 2 illustrates the temperature definition for Arctic waters.

For seasonally restricted service, the lowest value within the period of operation applies.

For the purpose of issuing a Polar Ship Certificate in accordance with the Polar Code, the design temperature  $t_D$  shall be no more than 13°C above the Polar Service Temperature (PST) of the ship.

In the Polar Regions, the statistical mean over observation period is to be determined for a period of, at least, 10 years.

**2.4.3** For the purpose of the selection of steel grades to be used for the structural members above the lowest ballast waterline and exposed to air, the latter are divided into categories (SECONDARY, PRIMARY and SPECIAL), as indicated in Tab 10.

Tab 10 also specifies the classes (I, II and III) of the materials to be used for the various categories of structural members. Class I is to be considered for superstructures and deckhouses structural members exposed to air.

For non-exposed structures (except bulkhead strakes as mentioned in footnote (5) of Tab 10) and structures below the lowest ballast waterline, see [2.3].

Figure 2 : Commonly used definitions of temperatures

Table 10 : Material classes and grades - Structures exposed to low air temperatures

Structural member category		Material class	
		Within 0,4L amidships	Outside 0,4L amidships
SECONDARY	Deck plating exposed to weather (in general) Side plating above $T_{BAL}$ Transverse bulkheads above $T_{BAL}$ (5)	I	I
PRIMARY	Strength deck plating (1) Continuous longitudinal members above strength deck (excluding longitudinal hatch coamings of ships equal to or greater than 90 m in length) Longitudinal bulkhead above $T_{BAL}$ (5) Topside tank bulkhead above $T_{BAL}$ (5)	II	I
SPECIAL	Sheer strake at strength deck (2) Stringer plate in strength deck (2) Deck strake at longitudinal bulkhead (3) Continuous longitudinal hatch coamings of ships equal to or greater than 90 m in length (4)	III	II

(1) Plating at corners of large hatch openings to be considered on a case by case basis. Class III or grade E/EH to be applied in positions where high local stresses may occur.  
 (2) To be not less than grade E/EH within 0,4 L amidships in ships with length exceeding 250 m.  
 (3) In ships with breadth exceeding 70 metres at least three deck strakes to be class III.  
 (4) To be not less than grade D/DH.  
 (5) Applicable to plating attached to hull envelope plating exposed to low air temperature. At least one strake is to be considered as exposed plating over a width of not less than 600 mm.

**Note 1:** Plating materials for sternframes, rudder horns, rudders and shaft brackets are to be of grades not lower than those corresponding to the material classes in [2.3].

**2.4.4** Materials may not be of a lower grade than that indicated in Tab 11 to Tab 13 depending on the material class, structural member gross thickness and design temperature  $t_D$ .

For design temperatures  $t_D < -55^\circ\text{C}$ , materials will be specially considered by the Society on a case by case basis.

**2.4.5** Single strakes required to be of class III or of grade E/EH or FH are to have breadths not less than  $(800+5L)$  mm, but not necessarily greater than 1800 mm.

**2.5 Grades of steel within refrigerated spaces**

**2.5.1** For structural members within or adjacent to refrigerated spaces, when the design temperatures is below  $0^\circ\text{C}$ , the materials are to be of grade not lower than those indicated in Tab 14, depending on the design temperature, the structural member gross thickness and its category (as defined in Tab 3).

**Table 11 : Material grade requirements for class I at low temperatures**

Gross thickness, in mm	$-11^\circ\text{C} / -15^\circ\text{C}$		$-16^\circ\text{C} / -25^\circ\text{C}$		$-26^\circ\text{C} / -35^\circ\text{C}$		$-36^\circ\text{C} / -45^\circ\text{C}$		$-46^\circ\text{C} / -55^\circ\text{C}$

**Note 2:** N.A. = not applicable.

**Table 14 : Material grade requirements for members within or adjacent to refrigerated spaces**

Design temperature, in °C	Gross thickness, in mm	Structural member category	
		Secondary	Primary or Special
$-10 \leq t_D < 0$	$t \leq 20$	B / AH	B / AH
	$20 < t \leq 25$	B / AH	D / DH
	$t > 25$	D / DH	E / EH
$-25 \leq t_D < -10$	$t \leq 15$	B / AH	D / DH
	$15 < t \leq 25$	D / DH	E / EH
	$t > 25$	E / EH	E / EH
$-40 \leq t_D < -25$	$t \leq 25$	D / DH	E / EH
	$t > 25$	E / EH	E / EH

**2.5.2** Unless a temperature gradient calculation is carried out to assess the design temperature and the steel grade in the structural members of the refrigerated spaces, the design temperatures to be considered are specified below:

- a) For members within refrigerated spaces:
  - temperature of the space on the uninsulated side, for plating insulated on one side only, either with uninsulated stiffening members (i.e. fitted on the uninsulated side of plating) or with insulated stiffening members (i.e. fitted on the insulated side of plating)
  - mean value of temperatures in the adjacent spaces, for plating insulated on both sides, with insulated stiffening members, when the temperature difference between the adjacent spaces is generally not greater than 10 °C (when the temperature difference between the adjacent spaces is greater than 10°C, the temperature value is established by the Society on a case by case basis)
- b) For members adjacent to refrigerated spaces:
  - temperature of the non-refrigerated space, conventionally taken equal to 0°C (in such case, the steel grades are to be considered as per [2.3]).

**2.5.3** Situations other than those mentioned in [2.5.1] and [2.5.2] or special arrangements will be considered by the Society on a case by case basis.

**2.5.4** Irrespective of the provisions of [2.5.1], [2.5.2] and Tab 14, steel having grades lower than those required in [2.3], Tab 3 and Tab 9, in relation to the class and gross thickness of the structural member considered, may not be used.

## 2.6 Through thickness properties

**2.6.1** Where normal tensile loads induce out-of-plane stress greater than 0,5 R<sub>y</sub> in steel plates:

- for plates with  $t < 15$  mm, ultrasonic testing is to be performed
- for plates with  $t \geq 15$  mm, Z-quality steel is to be used or ultrasonic testing is to be performed,

in order to prevent laminar tearing.

The above mentioned ultrasonic testing is to be performed, before and after welding, on the area of the plate located within 50 mm or  $t$ , whichever is the greater, around the weld, in accordance with NR216 Materials and Welding, Ch 3, Sec 12.

## 2.7 Stainless steel

**2.7.1** The reduction of strength of stainless steel with increasing temperature is to be taken into account in the calculation of the material factor  $k$  and in the material Young's modulus  $E$ .

Stainless steels are considered by the Society on a case-by-case basis.

## 3 Steels for forging and casting

### 3.1 General

**3.1.1** Mechanical and chemical properties of steels for forging and casting to be used for structural members are to comply with the applicable requirements of NR216 Materials and Welding.

**3.1.2** Steels of structural members intended to be welded are to have mechanical and chemical properties deemed appropriate for this purpose by the Society on a case-by-case basis.

**3.1.3** The steels used are to be tested in accordance with the applicable requirements of NR216 Materials and Welding.

### **3.2 Steels for forging**

**3.2.1** For the purpose of testing, which is to be carried out in accordance with the applicable requirements of NR216 Materials and Welding, steels for forging to be used for structural members are assigned to class 1 (see NR216 Materials and Welding, Ch 5, Sec 1, [2]).

**3.2.2** Rolled bars may be accepted in lieu of forged products, after consideration by the Society on a case-by-case basis. In such case, compliance with the applicable requirements of NR216 Materials and Welding, relevant to the quality and testing of rolled parts accepted in lieu of forged parts, may be required.

### **3.3 Steels for casting**

**3.3.1** Cast parts intended for stems and stern frames in general may be made of C and C-Mn weldable steels, having a specified minimum tensile strength  $R_m$  equal to 400 N/mm<sup>2</sup>, in accordance with the applicable requirements of NR216 Materials and Welding.

Items which may be subjected to high stresses may be required to be of quality 2 steels of the above types.

**3.3.2** For the purpose of testing, which is to be carried out in accordance with NR216 Materials and Welding, Chapter 6, steels for casting to be used for structural members are assigned to class 1 irrespective of their quality.

**3.3.3** The welding of cast parts to main plating contributing to hull strength members is considered by the Society on a case-by-case basis.

The Society may require additional properties and tests for such casting, in particular impact properties which are appropriate to those of the steel plating on which the cast parts are to be welded and non-destructive examinations.

**3.3.4** Heavily stressed cast parts of steering gear, particularly those intended to form a welded assembly and tillers or rotors mounted without key, are to be subjected to surface and volumetric non-destructive examination to check their internal structure.

## **4 Aluminium alloys**

### **4.1 General**

**4.1.1** The use of aluminium alloys in superstructures, deckhouses, hatch covers, helicopter platforms, or other local components is to be specially considered. A specification of the proposed alloys and their proposed method of fabrication is to be submitted for approval.

Material requirements and scantlings are to comply with the applicable requirements of NR216 Materials and Welding, Chapter 9. Series 5000 aluminium-magnesium alloys or series 6000 aluminium-magnesium-silicon alloys are to be used (see NR216 Materials and Welding, Ch 9, Sec 2).

**4.1.2** In the case of structures subjected to low service temperatures or intended for other specific applications, the alloys to be employed are to be agreed by the Society.

**4.1.3** Unless otherwise agreed, the Young's modulus for aluminium alloys is equal to 70000 N/mm<sup>2</sup> and the Poisson's ratio equal to 0,33.

**4.1.4** Details of the proposed method of joining any aluminium and steel structures are to be submitted for approval.

### **4.2 Extruded plating**

**4.2.1** Extrusions with built-in plating and stiffeners, referred to as extruded plating, may be used.

**4.2.2** In general, the application of extruded plating is limited to decks, bulkheads, superstructures and deckhouses. Other uses may be permitted by the Society on a case-by-case basis.

**4.2.3** Extruded plating is to be oriented so that the stiffeners are parallel to the direction of main stresses.

**4.2.4** Connections between extruded plating and primary members are to be given special attention.

### **4.3 Mechanical properties of weld joints**

**4.3.1** Welding heat input lowers locally the mechanical strength of aluminium alloys hardened by work hardening (series 5000 other than condition O or H111) or by heat treatment (series 6000).

**4.3.2** The as-welded properties of aluminium alloys of series 5000 are in general those of condition O or H111. Higher mechanical characteristics may be considered, provided they are duly justified.

**4.3.3** The as-welded properties of aluminium alloys of series 6000 are to be agreed by the Society.

**4.4 Material factor k**

**4.4.1** The material factor k for aluminium alloys is to be obtained from the following formula:

$$k = \frac{235}{R'_{lim}}$$

where:

- $R'_{lim}$  : Minimum guaranteed yield stress of the parent metal in welded condition  $R'_{p0,2}$ , in N/mm<sup>2</sup>, but not to be taken greater than 70% of the minimum guaranteed tensile strength of the parent metal in welded condition  $R'_m$ , in N/mm<sup>2</sup>
- $R'_{p0,2}$  : Minimum guaranteed yield stress, in N/mm<sup>2</sup>, of material in welded condition:  
 $R'_{p0,2} = \eta_1 R_{p0,2}$
- $R'_m$  : Minimum guaranteed tensile strength, in N/mm<sup>2</sup>, of material in welded condition:  
 $R'_m = \eta_2 R_m$
- $R_{p0,2}$  : Minimum guaranteed yield stress, in N/mm<sup>2</sup>, of the parent metal in delivery condition
- $R_m$  : Minimum guaranteed tensile strength, in N/mm<sup>2</sup>, of the parent metal in delivery condition
- $\eta_1, \eta_2$  : Coefficients specified in Tab 15.

**Table 15 : Aluminium alloys - Coefficients for welded construction**

Aluminium alloy	$\eta_1$	$\eta_2$
Alloys without work-hardening treatment (series 5000 in annealed condition 0 or annealed flattened condition H111)	1	1
Alloys hardened by work hardening (series 5000 other than condition 0 or H111)	$R'_{p0,2} / R_{p0,2}$	$R'_m / R_m$
Alloys hardened by heat treatment (series 6000) <b>(1)</b>	$R'_{p0,2} / R_{p0,2}$	0,6
<b>(1)</b> When no information is available, coefficient $\eta_1$ is to be taken equal to the metallurgical efficiency coefficient $\beta$ as defined in Tab 16.		

**Table 16 : Aluminium alloys - Metallurgical efficiency coefficient  $\beta$**

Aluminium alloy	Temper condition	As-built thickness, in mm	$\beta$
6005A (Open sections)	T5 or T6	$t \leq 6$	0,45
		$t > 6$	0,40
6005A (Closed sections)	T5 or T6	all	0,50
6061 (Sections)	T6	all	0,53
6082 (Sections)	T6	all	0,45

**4.4.2** In the case of welding of two different aluminium alloys, the material factor k to be considered for the scantlings is the greater material factor of the aluminium alloys of the assembly.

**4.4.3** For welded constructions in hardened aluminium alloys (series 5000 other than condition 0 or H111 and series 6000), greater characteristics than those in welded condition may be considered, provided that welded connections are located in areas where stress levels are acceptable for the alloy considered in annealed or welded condition.

**4.5 Others**

**4.5.1** Aluminium fittings in tanks used for the carriage of oil, and in cofferdams and pump rooms are to be avoided.

**4.5.2** The underside of heavy portable aluminium structures such as gangways, is to be protected by means of a hard plastic or wood cover, or other approved means, in order to avoid the creation of smears. Such protection is to be permanently and securely attached to the structures.

**5 Other materials and products**

**5.1 General**

**5.1.1** Other materials and products such as parts made of iron castings, where allowed, products made of copper and copper alloys, rivets, anchors, chain cables, cranes, masts, derrick posts, derricks, accessories and wire ropes are to comply with the applicable requirements of NR216 Materials and Welding.

**5.1.2** The use of plastics or other special materials not covered by these Rules is to be considered by the Society on a case-by-case basis. In such cases, the requirements for the acceptance of the materials concerned are to be agreed by the Society.

**5.1.3** Materials used in welding processes are to comply with the applicable requirements of NR216 Materials and Welding.

## **5.2 Iron cast parts**

**5.2.1** As a rule, the use of grey iron, malleable iron or spheroidal graphite iron cast parts with combined ferritic/perlitic structure is allowed only to manufacture low stressed elements of secondary importance.

**5.2.2** Ordinary iron cast parts may not be used for windows or sidescuttles; the use of high grade iron cast parts of a suitable type is to be considered by the Society on a case-by-case basis.

## Section 2 Net Scantling Approach

### Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

- $d_f$  : Distance in mm, for the extension of flange for L1 profiles, see Fig 3.  
 $t_{dm}$  : Design production margin, in mm, taken as the thickness difference between offered gross thickness and required gross thickness (equal also to the difference between offered net and required net thickness) as a result of scantlings applied by the designer or builder to suit design or production situation. This difference in thickness is not to be considered as an additional corrosion margin.

## 1 General

### 1.1 Application

#### 1.1.1 Net thickness approach

The scantling of a structural element determined for its strength in compliance with the design basis is expressed in terms of net thickness  $t$ , i.e. it does not include the corrosion addition.

The corrosion addition,  $t_c$ , for a structural element is derived independently from the net scantling requirements as shown in Fig 1.

This approach clearly separates the net thickness from the thickness added to address the corrosion that is likely to occur during the ship-in-operation phase.

#### 1.1.2 Exceptions in gross scantling

Items that are directly determined in terms of gross scantlings do not follow the net scantling approach, i.e. they already include additions for corrosion but without any Owner's extra margin. Gross scantling requirements are identified with the suffix "gr" and examples are:

- scantlings of superstructures and deckhouses as given in Ch 11, Sec 5
- scantlings of bow doors and inner doors as given in Ch 11, Sec 6
- scantlings of side doors and stern doors as given in Ch 11, Sec 7
- scantlings of rudder structures and hull appendages in Part B, Chapter 12
- scantlings of massive pieces made of steel forgings and steel castings.

Figure 1 : Net scantling approach scheme

## **1.2 Gross and net scantling definitions**

### **1.2.1 Gross required thickness**

The gross required thickness,  $t_{gr\_req}$ , is the thickness obtained by adding the corrosion addition as defined in Ch 4, Sec 3 to the net required thickness, as follows:

$$t_{gr\_req} = t_{req} + t_c$$

### **1.2.2 Gross offered thickness**

The gross offered thickness,  $t_{gr\_off}$ , is the gross thickness provided at the newbuilding stage, which is obtained by deducting any thickness for voluntary addition from the as-built thickness, as follows:

$$t_{gr\_off} = t_{as\_built} - t_{vol\_add}$$

### **1.2.3 Net offered thickness**

The net offered thickness,  $t_{off}$ , is obtained by subtracting the corrosion addition from the gross offered thickness, as follows:

$$t_{off} = t_{gr\_off} - t_c = t_{as\_built} - t_{vol\_add} - t_c$$

## **1.3 Rounding off of scantlings**

### **1.3.1 Thicknesses**

The rounding off of thicknesses is to be performed as follows:

- a) the gross required thickness  $t_{gr\_req}$  as defined in [1.2.1] is rounded off to the nearest half-millimetre.
- b) the rounded net thickness is taken equal to the rounded gross thickness, obtained in a), minus the corrosion addition  $t_c$ .

Note 1: Examples of thickness values rounded off to the nearest half-millimetre are given below for reference:

- for  $10,75 \leq t_{gr\_req} < 11,25$  mm:  
The rounded value of  $t$  is 11 mm
- for  $11,25 \leq t_{gr\_req} < 11,75$  mm:  
The rounded value of  $t$  is 11,5 mm

### **1.3.2 Stiffener section moduli**

Stiffener section moduli as calculated in accordance with the Rule requirements are to be rounded off to the nearest standard value; however, no reduction may exceed 3%.

## **1.4 Scantling compliance**

**1.4.1** Scantling compliance in relation to the Rules is as follows:

- The net offered thickness of plating is to be equal to or greater than the net required thickness of plating.
- The net offered section modulus, moment of inertia and shear area of local supporting members are to be equal to or greater than the net required properties calculated using the net thickness of the attached plate, web and flange. The net sectional dimensions of local supporting members are defined in Fig 2 and Fig 3. The required section modulus and web net thickness apply to areas clear of the end brackets.
- the offered net sectional properties of primary supporting members and the hull girder are to be equal to or greater than the required net sectional properties which are to be based on the gross offered scantling with a reduction of the applicable corrosion addition, as specified in Tab 1, applied to all component structural members
- the strength assessment methods prescribed are to be assessed by applying the corrosion reduction specified in Tab 1 to the offered gross scantlings. Half of the applied corrosion addition specified in Tab 1 is to be deducted from both sides of the structural members being considered
- corrosion additions are not to be taken less than those given in Ch 4, Sec 3, [1.2].

Any additional thickness specified by the Owner or the builder is not to be included when considering the compliance with the Rules.

The net cross-sectional area, the moment of inertia about the y-axis and the associated neutral axis position are to be determined applying a corrosion magnitude of  $0,5 t_c$  deducted from the surface of the profile cross-section.

Figure 2 : Net sectional properties of local supporting members

Figure 3 : Net sectional properties of local supporting members (continued)

**Table 1 : Assessment for corrosion applied to the gross scantlings**

Structural requirement	Property/analysis type	Applied corrosion addition
Minimum thickness (all members including PSM)	Thickness	$t_c$
Local strength (plates, stiffeners)	Thickness/sectional properties	$t_c$
	Stiffness / Proportions / Buckling capacity	$t_c$
Primary supporting members (prescriptive)	Sectional properties <b>(1)</b>	$0,5 t_c$
	Stiffness/proportions of web and flange Buckling capacity	$t_c$
Strength assessment by direct strength analysis	Cargo hold / Complete ship model	$0,5 t_c$
	Buckling capacity	$t_c$
	Local fine mesh	$0,5 t_c$
Hull girder strength	Sectional properties	$0,5 t_c$
	Buckling capacity	$t_c$
Hull girder ultimate strength	Sectional properties	$0,5 t_c$
	Buckling/collapse capacity	$0,5 t_c$
Fatigue assessment (simplified stress analysis)	Hull girder section properties	$0,5 t_c$
	Local support member	
Fatigue assessment (FE stress analysis)	Standard mesh FE model Very fine mesh portion	$0,5 t_c$
<p><b>Note 1:</b> Different values may be defined for ships granted a specific service notation, in compliance with the applicable chapters of Part D or Part E.</p> <p><b>(1)</b> <math>t_c</math> is to be applied to sectional properties of bulkheads corrugations.</p>		

## Section 3 Corrosion Additions

### Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

$t_{res}$  : Reserve thickness, taken equal to 0,5 mm.

### 1 General

#### 1.1 Applicability

**1.1.1** The corrosion additions are applicable to carbon-manganese steels, stainless steels, stainless clad steels and aluminium alloys.

#### 1.2 Corrosion addition determination

##### 1.2.1 Corrosion addition for steel other than stainless steel

The total corrosion addition,  $t_c$ , in mm, for both sides of the structural member is obtained as follows:

- for structural members with a gross thickness greater than 10 mm:

$$t_c = t_{c1} + t_{c2} + t_{res}$$

- for structural members with a gross thickness less than or equal to 10 mm,  $t_c$  is the smallest of the following values:

$$t_{c1} + t_{c2} + t_{res}$$

$$0,2 t_{gr\_off}$$

The corrosion addition for each of the two sides of a structural member,  $t_{c1}$  or  $t_{c2}$ , is specified in Tab 1.

However, when  $t_{c1} = t_{c2} = 0$ , the total corrosion addition is to be taken as  $t_c = 0$ .

Note 1: For an internal member within a given compartment, the formula  $t_{c1} + t_{c2} + t_{res}$  becomes  $2 t_{c1} + t_{res}$ , where  $t_{c1}$  is the value specified in Tab 1 for one side exposure to that compartment.

##### 1.2.2 Corrosion addition for steel clad with stainless steel

In case of stainless clad steel, the total corrosion addition is to be obtained as described in [1.2.1] with the following adjustments:

- the corrosion addition for the carbon steel side  $t_{c1}$  is the value specified in Tab 1 for the corresponding compartment
- the corrosion addition for the stainless steel side is:

$$t_{c2} = 0$$

##### 1.2.3 Corrosion addition for aluminium alloys and stainless steel

The total corrosion addition,  $t_c$ , in mm, for compartment boundaries and internal members made of stainless steel or aluminium alloy is to be taken as:

$$t_c = 0$$

##### 1.2.4 Stiffener

The corrosion addition of a stiffener is determined according to the location of its connection to the attached plating.

The total corrosion addition determined as per [1.2.1] based on the thinner thickness part of the stiffener is to be applied to both web and flange.

**1.2.5** When a local structural member/plate is affected by more than one value of corrosion addition, the most onerous value is to be applied to the entire strake.

Table 1 : Corrosion addition for one side of a structural member

Compartment type		$t_{c1}$ or $t_{c2}$
Ballast water tank (1), bilge tank, drain storage tank, chain locker (2)		1,00
Exposed to atmosphere		1,00
Exposed to seawater		1,00
Cargo oil tank, fuel and lube oil tank (3) Independent or integral methanol fuel tank of ships with additional service feature <b>methanolfuel</b> (10)		0,50
Liquefied gas tank (5) (11)		0,00
Dry bulk cargo hold (4)	General	1,00
	Inner bottom plating Side plating for single hull ship Inner side plating for double hull ship Transverse bulkhead plating Sloping stool plate of hopper tanks and lower stool	1,75
	Frames, ordinary stiffeners and primary supporting members (6)	1,00
Fresh water tank		0,50
Moonpool		1,75
Tanks dedicated to water-based or oil-based process muds or brines		1,25
Hopper well of dredging ships		2,00
Compartment located between independent tank and inner side of ships with the additional service feature <b>asphalt carrier</b>		1,00
Cofferdam or void space (7) (8)		0,50
Dry spaces (inside of machinery spaces, pump room, store rooms, steering gear space, passageways, etc.)		0,50 (9)
Container holds	Transverse bulkheads	0,50
	Elsewhere	1,00
Accommodation spaces		0,00
Compartments other than those mentioned above		0,50
<p>(1) Ballast water tank: does not include cargo oil tanks which may carry ballast according to Regulation 18 of MARPOL 73/78.</p> <p>(2) 1,0 mm is to be added to the plate surface within 3 m above the upper surface of the chain locker bottom.</p> <p>(3) For ships with the service notation <b>chemical tanker ESP</b>, the corrosion addition <math>t_c</math> may be taken equal to 0 for cargo tanks covered with a protective lining or coating (see IBC, 6).</p> <p>(4) Dry bulk cargo hold: includes holds, intended for the carriage of dry bulk cargoes, which may carry oil or water ballast.</p> <p>(5) The corrosion addition <math>t_c</math> specified for liquefied gas tanks is to be applied when required in:</p> <ul style="list-style-type: none"> <li>• Pt D, Ch 9, Sec 4, [2.1.5], or</li> <li>• NR529, [6.4.1].</li> </ul> <p>(6) 0,50 mm is to be added within 3 m above the bottom of the hold.</p> <p>(7) Cofferdam includes cofferdam in cargo area of ships with the service notation <b>liquefied gas carrier</b> or cofferdams adjacent to the gasfuel tank on ships with additional service feature <b>LNGfuel</b>, <b>CNGfuel</b>, <b>LPGfuel</b> or <b>ammoniafuel</b>.</p> <p>(8) For the determination of the corrosion addition of the outer shell plating, the pipe tunnel is considered as a ballast water tank.</p> <p>(9) For the direct strength assessment according to Ch 8, Sec 1 of ships assigned the service notation <b>container ship</b>, <math>t_{c1}</math> or <math>t_{c2}</math> is to be taken equal to 0,0 mm.</p> <p>(10) The corrosion addition <math>t_c</math> may be taken equal to 0 for tanks covered with a protective lining or coating.</p> <p>(11) Including tanks of ships with service notation <b>liquefied gas carrier</b> and gas fuel tanks of ships with the additional service feature <b>LNGfuel</b>, <b>CNGfuel</b>, <b>LPGfuel</b> or <b>ammoniafuel</b>.</p>		

## Section 4 Protection of Hull Metallic Structures

### 1 Protection by coating

#### 1.1 General

1.1.1 It is the responsibility of the shipbuilder and the Owner to choose the coating and have it applied in accordance with the manufacturer's requirements.

#### 1.2 Structures to be protected

1.2.1 All salt water ballast spaces with boundaries formed by the hull envelope are to have a corrosion protective coating, epoxy or equivalent, applied in accordance with the manufacturer's requirements.

For ships assigned with the additional service feature or the additional class notation **CPS (WBT)** according to Pt A, Ch 1, Sec 2, [4.16.11] or Pt A, Ch 1, Sec 2, [6.24.4], reference is to be made to NR530 Coating Performance Standard.

1.2.2 Corrosion protective coating is not required for internal surfaces of spaces intended for the carriage of cargo oil or fuel oil.

1.2.3 Narrow spaces are generally to be filled by an efficient protective product, particularly at the ends of the ship where inspections and maintenance are not easily practicable due to their inaccessibility.

### 2 Protection against galvanic corrosion in tanks

#### 2.1 General

2.1.1 Non-stainless steel is to be electrically insulated from stainless steel or from aluminium alloys.

2.1.2 Where stainless steel or aluminium alloys are fitted in the same tank as non-stainless steel, a protective coating is to cover both materials.

### 3 Protection of bottom by ceiling

#### 3.1 General

3.1.1 In double bottom ships, ceiling is to be laid over the inner bottom and lateral bilges, if any.

Ceiling on the inner bottom is not required where the thickness of the inner bottom is increased in accordance with Ch 7, Sec 4, [6.3.1].

#### 3.2 Arrangement

3.2.1 Planks forming ceiling over the bilges and on the inner bottom are to be easily removable to permit access for maintenance.

3.2.2 Where the double bottom is intended to carry fuel oil, ceiling on the inner bottom is to be separated from the plating by means of battens 30 mm high, in order to facilitate the drainage of oil leakages to the bilges.

3.2.3 Where the double bottom is intended to carry water, ceiling on the inner bottom may lie next to the plating, provided a suitable protective composition is applied beforehand.

3.2.4 The Shipyard is to take care that the attachment of ceiling does not affect the tightness of the inner bottom.

3.2.5 In single bottom ships, ceiling is to be fastened to the reversed frames by galvanised steel bolts or any other equivalent detachable connection.

A similar connection is to be adopted for ceiling over the lateral bilges in double bottom ships.

#### 3.3 Scantlings

3.3.1 The thickness of ceiling boards, when made of pine, is to be not less than 60 mm. Under cargo hatchways, the thickness of ceiling is to be increased by 15 mm.

Where the floor spacing is large, the thicknesses may be considered by the Society on a case by case basis.

## 4 Protection of decks by wood sheathing

### 4.1 General

4.1.1 Where decks are intended to carry specific loads, such as caterpillar trucks and unusual vehicles, the Society may require such decks wood sheathed.

### 4.2 Arrangement

4.2.1 Wood sheathing is to be fixed to the plating by welded studs or bolts of at least 12 mm in diameter, every second frame.

4.2.2 Before fitting the wood sheathing, deck plates are to be provided with protective coating declared to be suitable by the Shipyard.

Caulking is Shipyard's responsibility.

### 4.3 Scantlings

4.3.1 The thickness of wood sheathing of decks is to be not less than:

- 65 mm if made of pine
- 50 mm if made of hardwood, such as teak.

The width of planks is not to exceed twice their thickness.

## 5 Protection of cargo sides by battens

### 5.1 General

5.1.1 The requirements in [5.2] apply to sides in cargo spaces of ships with the service notation **general cargo ship** or **livestock carrier**.

### 5.2 Arrangement

5.2.1 In the case of transversally framed sides, longitudinal battens formed by spaced planks are to be fitted to the frames by means of clips.

5.2.2 Where sides are longitudinally framed, battens are to be fitted vertically.

5.2.3 Battens are to extend from the bottom of the cargo space to at least the underside of the beam knees.

5.2.4 Cargo battens are to be not less than 50 mm in thickness and 150 mm in width. The space between battens is not to exceed 300 mm.

# Section 5

## Structural Detail Principles

### Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

Z : Net required section modulus, of the stiffener, in  $\text{cm}^3$ . In the case of two stiffeners connected, Z is the smallest net required section modulus of the two connected stiffeners.

## 1 Application

### 1.1 General

1.1.1 The requirements of this Section apply to the hull structure.

## 2 General principles

### 2.1 Structural continuity

#### 2.1.1 General

Attention is to be paid to the structural continuity, in particular in the following areas:

- in way of changes in the framing system
- at end connections of primary supporting members or ordinary stiffeners
- in way of the transition zones between central part and fore part, aft part and machinery space (See Ch 11, Sec 1, Ch 11, Sec 2 and Ch 11, Sec 3)
- in way of front, side and aft bulkheads of superstructures
- stepped or knuckled decks contributing to longitudinal strength.

At the termination of a structural member, structural continuity is to be maintained by the fitting of suitable supporting structure. Abrupt changes in transverse section properties of longitudinal members are to be avoided. Smooth transitions are to be provided.

#### 2.1.2 Longitudinal members

Longitudinal members are to be arranged in such a way that continuity of strength is maintained.

Longitudinal members contributing to the hull girder longitudinal strength are to extend continuously as far as practicable towards the ends of the ship.

Longitudinals of the bottom, bilge, sheerstrake, deck, upper and lower longitudinal bulkhead and inner side strakes, as well as the latter strakes themselves, the lower strake of the centreline bottom girder and the upper strake of the centreline deck girder, where fitted, are to be continuous through the transverse bulkheads of the cargo area and cofferdams. Alternative solutions may be examined by the Society on a case by case basis, provided they are equally effective.

#### 2.1.3 Primary supporting members

Primary supporting members are to be arranged in such a way that continuity of strength is maintained.

Abrupt changes of web height or cross-section are to be avoided.

#### 2.1.4 Stiffeners

Stiffeners are to be arranged in such a way that continuity of strength is maintained.

Stiffeners contributing to the hull girder longitudinal strength are generally to be continuous when crossing primary supporting members within  $0,4 L$  amidships and as far as practicable outside  $0,4 L$  amidships.

For ships with  $L$  less than 90m, alternative arrangements to ensure structural continuity such as brackets may be considered on a case-by-case basis.

Where stiffeners are terminated in way of large openings, foundations and partial girders, compensation is to be arranged to provide structural continuity in way of the end connection.

#### 2.1.5 Plating

Where plates with different thicknesses are joined, the change in the as-built plate thickness is not to exceed 50% of the larger plate thickness in the load carrying direction. This does not apply in the case of insert plates thicker than the plate they are welded to. If the difference in thickness is greater than 50% of the larger plate thickness, an intermediate plate is to be inserted. Welding of the plates is to be as per Ch 13, Sec 3, [2.1.2].

### **2.1.6 Weld joints**

Weld joints are to be avoided in areas with high stress concentration.

## **2.2 Local reinforcements**

### **2.2.1 General**

Where stress concentration may occur in way of structural discontinuities, adequate compensation and reinforcement are to be provided.

### **2.2.2 Reinforcements at knuckles**

- a) Knuckles are in general to be stiffened to achieve out-of-plane stiffness by fitting ordinary stiffeners or equivalent means in line with the knuckle. Arrangements without stiffener may be accepted on a case-by-case basis depending on the knuckle angle and stress level.
- b) Whenever a knuckle in a main member (shell, longitudinal bulkhead, etc) is arranged, stiffening in the form of webs, brackets or profiles is to be connected to the members to which they are to transfer the load (in shear).
- c) For longitudinal shallow knuckles, closely spaced carlings are to be fitted across the knuckle, between longitudinal members above and below the knuckle. Carlings or other types of reinforcement need not be fitted in way of shallow knuckles that are not subject to high lateral loads and/or high in-plane loads across the knuckle, such as deck camber knuckles.
- d) Generally, the distance between the knuckle and the support stiffening in line with the knuckle is not to be greater than 50 mm. Otherwise, fatigue analysis according to Part B, Chapter 10 is to be submitted by the designer.

### **2.2.3 Reinforcement in way of attachments for permanent means of access**

Local reinforcement, considering location and strength, is to be provided in way of attachments to the hull structure for permanent means of access to and within spaces in the cargo area on ships with service notation **oil tanker** or **bulk carriers, bulk carriers ESP, self-unloading bulk carriers ESP, ore carrier ESP** and **combination carrier ESP**.

### **2.2.4 Reinforcement of deck structure in way of concentrated loads**

The deck structure is to be reinforced in way of concentrated loads, such as anchor windlass, deck machinery, cranes, masts and derrick posts.

Special arrangements, such as girders supported by cantilevers, are considered by the Society on a case-by-case basis.

Stiffeners are also to be fitted in way of the ends and corners of deck houses and partial superstructures.

### **2.2.5 Reinforcement by insert plates**

A local increase in plating thickness is generally to be achieved through insert plates. Local doublers, which are normally only allowed for temporary repair, may however be accepted by the Society on a case by case basis.

In any case, doublers and insert plates are to be made of materials with, at least, the same specified minimum yield stress and the same grade as the plates to which they are welded. See also [2.1.5].

### **2.2.6 Doublers**

In general, doublers having width, in mm, greater than:

- 20 times their thickness, for thicknesses equal to or less than 15 mm
- 25 times their thickness, for thicknesses greater than 15 mm

are to be fitted with slot welds, to be effected according to Ch 13, Sec 3, [4.2].

When doublers fitted on the outer shell and strength deck within 0,6L amidships are accepted by the Society, their width and thickness are to be such that slot welds are not necessary according to the above requirements. Outside this area, the possibility of fitting doublers requiring slot welds will be considered by the Society on a case by case basis.

## **2.3 Connection between steel and aluminium**

**2.3.1** Any direct contact between steel and aluminium alloy is to be avoided (e.g. by means of zinc or cadmium plating of the steel parts and application of a suitable coating on the corresponding light alloy parts).

Any heterogeneous jointing system is considered by the Society on a case-by-case basis.

The use of transition joints made of aluminium/steel-clad plates or profiles is considered by the Society on a case-by-case basis (see NR216 Materials and Welding, Ch 9, Sec 4).

## **3 Stiffeners**

### **3.1 General**

**3.1.1** All types of stiffeners (excluding web stiffeners) are to be connected at their ends. However, in special cases such as isolated areas of the ship where end connections cannot be applied, sniped ends may be permitted. Requirements for the various types of connections (bracketed, bracketless or sniped ends) are given in [3.2] to [3.4].

3.1.2 Where the angle  $\alpha$  between the web plate of the stiffener and the attached plating is less than 50 deg, as shown on Fig 1, a tripping bracket is to be fitted. If the angle between the web plate of an unsymmetrical stiffener and the attached plating is less than 50 deg, the face plate of the stiffener is to be fitted on the side of the open angle.

Figure 1 : Stiffener on attached plating with an angle less than 50 deg

### 3.2 Bracketed end connections of non-continuous stiffeners

3.2.1 Where continuity of strength of longitudinal members is provided by brackets, the alignment of the brackets on each side of the primary supporting member is to be ensured, and the scantlings of the brackets are to be such that the combined stiffener/bracket section modulus and effective cross-sectional area are not less than those of the member.

3.2.2 At bracketed end connections, continuity of strength is to be maintained at the stiffener connection to the bracket and at the connection of the bracket to the supporting member.

3.2.3 The arrangement of the connection between the stiffener and the bracket is to be such that, at no point in the connection, the section modulus is less than that required for the stiffener.

#### 3.2.4 Net web thickness

The net bracket web thickness  $t_b$ , in mm, is to comply with the following condition:

$$t_b \geq (2 + f_{bkt} \sqrt{Z}) \sqrt{\frac{R_{eH-stf}}{R_{eH-bkt}}}$$

and need not be greater than 13,5 mm,

with:

$f_{bkt}$  : Coefficient taken equal to:

- 0,2 for brackets with flange or edge stiffener
- 0,3 for brackets without flange or edge stiffener

$R_{eH-stf}$  : Specified minimum yield stress of the stiffener material, in N/mm<sup>2</sup>

$R_{eH-bkt}$  : Specified minimum yield stress of the bracket material, in N/mm<sup>2</sup>.

#### 3.2.5 Brackets at the ends of non-continuous stiffeners

Brackets are to be fitted, at the ends of non-continuous stiffeners, with arm lengths  $\ell_1$  and  $\ell_2$  (see Fig 2), in mm, at least equal to  $\ell_{bkt}$ , as defined below:

$$\ell_{bkt} = C_{bkt} \sqrt{Z}$$

with:

$C_{bkt}$  : Coefficient taken equal to:

- 65 for brackets with flange or edge stiffener
- 70 for brackets without flange or edge stiffener

$t_b$  : Minimum net bracket web thickness, in mm, as defined in [3.2.4]

$l_{bkt}$  is not to be taken less than:

- $1,8 h_{stf}$  for connections where the end of the stiffener web is supported and the bracket is welded in line with the stiffener web or with offset necessary to enable welding, see case (c) in Fig 2
- $2,0 h_{stf}$  for other cases, see (a), (b) and (d) in Fig 2
- $2,0 h_{stf}$  for connections similar to item (b) in Fig 2 but not lapped
- $2,0 h_{stf}$  for connections similar to cases (c) and (d) in Fig 2 where the smaller stiffener is connected to a primary supporting member or bulkhead.

**3.2.6 Brackets with different arm lengths**

The arms lengths  $l_1$  and  $l_2$  as shown on Fig 2, measured from the plating to the toe of the bracket, are to be such that:

$$l_1 + l_2 > 2 l_{bkt} \quad \text{and} \quad l_1 \geq 0,8 l_{bkt} \quad \text{and} \quad l_2 \geq 0,8 l_{bkt}$$

where  $l_{bkt}$  is as defined in [3.2.5].

**3.2.7 Edge stiffening of bracket**

Where an edge stiffener is required, the web height of the edge stiffener  $h_w$ , in mm, is not to be less than:

$$h_w = 45 \left( 1 + \frac{Z}{2000} \right)$$

without being less than 50 mm.

**Figure 2 : Bracket arm lengths of non-continuous stiffeners**

### **3.3 Bracketless connections**

**3.3.1** The design of bracketless connections is to be such as to provide adequate resistance to rotation and displacement of the connection.

### **3.4 Sniped ends**

**3.4.1** Sniped ends may be used where dynamic loads are small, provided the net thickness  $t_p$  of plating supported by the stiffener, in mm, is not less than:

$$t_p = c_1 \sqrt{\left(1000\ell - \frac{s}{2}\right) \frac{sPk}{10^6}}$$

where:

P : Design pressure for the stiffener for the design load set being considered, in kN/m<sup>2</sup>

$c_1$  : Coefficient for the design load set being considered, to be taken as:

- $c_1 = 1,2$  for acceptance criteria set AC-1
- $c_1 = 1,1$  for acceptance criteria set AC-2
- $c_1 = 1,0$  for acceptance criteria set AC-3

k : Material factor, as defined in Ch 4, Sec 1, for the plating.

Sniped stiffeners are not to be used on structures in the vicinity of engines or generators or propeller impulse zone nor on the shell envelope.

**3.4.2** Bracket toes and sniped stiffeners ends are to be terminated close to the adjacent member. The distance is not to exceed 40 mm unless the bracket or member is supported by another member on the opposite side of the plating. Tapering of the sniped end is not to be more than 30 deg. The depth of toe or sniped end is not to exceed the thickness of the bracket toe or sniped end member, but need not be less than 15 mm.

## **4 Primary supporting members (PSM)**

### **4.1 General**

**4.1.1** Primary supporting members web stiffeners, tripping brackets and end brackets and connections are to comply with [4.2] to [4.5]. Where the structural arrangement is such that these requirements cannot be complied with, adequate alternative arrangement has to be demonstrated to the Society by the designer.

### **4.2 Web stiffening arrangement**

**4.2.1** Webs of primary supporting members are generally to be stiffened where the height, in mm, is greater than 100t, where t is the web net thickness, in mm, of the primary supporting member. Alternatively, this requirement may be waived based on a satisfactory buckling analysis as per Ch 9, Sec 1.

In general, the web stiffeners of primary supporting members are to be spaced not more than 110t.

### **4.3 Tripping bracket arrangement**

**4.3.1** Tripping brackets are generally to be fitted:

- in way of end brackets toes (see Fig 3, (b))
- at ends of continuous curved face plates (see Fig 3, (c))
- in way of concentrated loads
- near primary supporting members changes of sections.

**4.3.2** Tripping brackets are to be fitted at positions along the member span such that they satisfy the criteria for tripping bracket spacing and flange slenderness given in Ch 9, Sec 1.

**4.3.3** Where the face plate of the primary supporting members exceeds 180 mm on either side of the web, a tripping bracket is to support the face plate.

**4.3.4** Where the face plate of the primary supporting members is symmetrical and greater than 400 mm in width, backing brackets are to be fitted in way of the tripping brackets (see Fig 3, (a)).

#### **4.3.5 Arm length**

The arm length of tripping brackets is not to be less than the greater of the following values, in m:

- $d = 0,38 b$

- $d = 0,85b \sqrt{\frac{S_1}{t}}$

where:

- b : Height, in m, of tripping brackets, see Fig 3, (a)
- $s_t$  : Spacing, in m, of tripping brackets
- t : Net thickness, in mm, of tripping brackets.

**Figure 3 : Primary supporting member - Tripping bracket arrangement**

**4.4 Bracketed end connections**

**4.4.1 General**

Brackets or equivalent structure are to be provided at ends of primary supporting members.

Bracketless connections may be applied according to [4.5], provided there is adequate support of adjoining face plates.

**4.4.2 Scantling of end brackets**

The scantling of the end brackets is to be such that the section modulus of the primary supporting member with end bracket, excluding face plate where it is sniped, is not less than that of the primary supporting member at mid-span.

The net cross-sectional area  $A_f$ , in  $cm^2$ , of the bracket face plates is to be such that:

$$A_f \geq l_b t_b$$

where:

- $l_b$  : Length of the bracket edge, in m (see Fig 4). For curved brackets,  $l_b$  may be taken as the length of the tangent at midpoint of the edge
- $t_b$  : Minimum net bracket web thickness, in mm, as defined in [3.2.4].

Moreover, the net thickness of the face plate is to be not less than that of the bracket web.

Figure 4 : Dimension of brackets

Figure 5 : Bracket face plate adjacent to the edge

#### 4.4.3 Arrangement of end brackets

Where the length  $l_b$  of the bracket free edge is greater than 1,5 m, the web of the bracket is to be stiffened as follows:

- the net sectional area, in  $\text{cm}^2$ , of web stiffeners is to be not less than  $16,5 \ell$ , where  $\ell$  is the span, in m, of the stiffener
- tripping flat bars are to be fitted, and, where the width of the symmetrical face plate is greater than 400 mm, additional backing brackets are to be provided.

For a ring system, where the end bracket is integral with the web of the two connected members and the face plate runs continuously on the bracket from the web of one member to the other, the full cross section of the larger face plate of the two members is to be maintained close to the mid-point of the bracket and gradually tapered to the smaller face plate. Butts in face plates are to be kept well clear of the bracket toes.

Where a wide face plate abuts a narrower one, the taper is not to be greater than 1 to 4.

The bracket toes are not to land on unstiffened plating. The toe height is not to be greater than the thickness of the bracket toe, but need not be less than 15 mm. Where primary supporting members are constructed of steel having a strength higher than the strength of the bracket steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations.

Where a face plate is welded onto, or welded adjacent to, the edge of the end bracket (see Fig 5), the face plate is to be sniped and tapered at an angle not greater than  $30^\circ$ .

#### 4.5 Bracketless end connections

4.5.1 In the case of bracketless crossing between two primary supporting members (see Fig 6), the net thickness of the common part of the webs  $t_b$ , in mm, is to be not less than the greatest value obtained from the following formulae:

- $t_b = \frac{Sf_1 \sigma_1 k}{0,5 h_2 R_{eH}}$
- $t_b = \frac{Sf_2 \sigma_2 k}{0,5 h_1 R_{eH}}$
- $t_b = \max(t_1 ; t_2)$

where:

- k : Material factor as defined in Ch 4, Sec 1
- $h_1, h_2$  : Width, in mm, of member 1 and member 2, respectively, see Fig 6
- $Sf_1, Sf_2$  : Net flange sectional area, in mm<sup>2</sup>, of member 1 and member 2, respectively
- $\sigma_1, \sigma_2$  : Normal stresses, in N/mm<sup>2</sup> in member 1 and member 2, respectively
- $t_1, t_2$  : Net web thicknesses, in mm, of member 1 and member 2, respectively.

**Figure 6 : Bracketless end connections between two primary supporting members**

**4.5.2** In the case of bracketless crossing between three primary supporting members (see Fig 7), when the flange of member 2 and member 3 is continuous, the net thickness, in mm, of the common part of the webs is not to be less than the greater of:

- $t_b = \frac{Sf_1 \sigma_1 k}{0,5 h_2 R_{eH}}$
- $t_b = \max (t_1 ; t_2)$

Where  $Sf_1, \sigma_1, k, h_2, t_1$  and  $t_2$  are as defined in [4.5.1] and Fig 7.

When the flanges of member 2 and member 3 are not continuous, the net thickness of the common part of the webs is to be defined as per [4.5.1].

**Figure 7 : Bracketless end connections between three primary supporting members**

**4.5.3** The common part of the webs is to be generally stiffened where the minimum height of the member 1 and member 2 is greater than 100  $t_b$ . Alternatively, this requirement may be waived based on a satisfactory buckling analysis as per Ch 9, Sec 1.

**4.5.4** When lamellar tearing of flanges may occur, the flange in way of the connection may be requested to be of Z quality or a 100% ultrasonic testing of the flange in way of the weld may be required prior to and after welding.

## 5 Intersection of stiffeners and primary supporting members

### 5.1 Cut-outs

**5.1.1** Cut-outs for the passage of stiffeners through the web of primary supporting members, and the related collaring arrangements, are to be designed to minimise stress concentrations around the perimeter of the opening and on the attached web stiffeners.

**5.1.2** The total depth of cut-outs without collar plate is to be not greater than 50% of the depth of the primary supporting member.

**5.1.3** Cut-outs in high stress areas are to be fitted with full collar plates, see Fig 8.

**5.1.4** Lug type collar plates are to be fitted in cut-outs where required for compliance with the requirements of [5.2], and in areas of high stress concentrations, e.g. in way of primary supporting member toes. See Fig 10 for typical lug arrangements.

**5.1.5** On cargo ships with length greater than 150m, a soft heel is to be provided in way of the heel of the primary supporting member web stiffeners at connection to shell envelope longitudinals below the scantling draught  $T_{sc}$  and at connection to inner bottom longitudinals, when the calculated direct stress  $\sigma_w$  in the primary supporting member web stiffener according to [5.2] exceeds 80% of the allowable values. The soft heel is to have a keyhole similar to that shown in Fig 9.

A soft heel is not required at the intersection with watertight bulkheads and primary supporting members where a back bracket is fitted or where the primary supporting member web is welded to the stiffener face plate.

When calculating the direct stress,  $\sigma_w$ , the bottom slamming, stern slamming or bow impact loads using the design pressures defined in Ch 5, Sec 5, [4.2] and Ch 5, Sec 5, [4.3] need not be applied.

**5.1.6** Cut-outs are to have rounded corners and the corner radii  $R$  are to be as large as practicable, with a minimum of 20% of the breadth  $b$  of the cut-out or 25 mm, whichever is greater. See Fig 8. The corner radii  $R$  do not need be greater than 50 mm. Consideration is to be given to other shapes, on the basis of maintaining equivalent strength and minimising stress concentration.

### 5.2 Connection of stiffeners to PSM

#### 5.2.1 General

For connection of stiffeners to PSM subjected to lateral pressure, [5.2.2] and [5.2.3] are to be applied.

The cross-sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate allowable stress.

Figure 8 : Full collar plates

Figure 9 : Typical keyhole for soft heel at the heel of primary supporting member web stiffeners

Figure 10 : Symmetric and asymmetric cut-outs

5.2.2 The load  $W_1$ , in kN, transmitted through the shear connection is to be taken as follows:

- for web stiffener connected to the intersecting stiffener:

$$W_1 = W \left( \alpha_a + \frac{A_1}{4f_c A_w + A_1} \right)$$

- for web stiffener not connected to the intersecting stiffener:

$$W_1 = W$$

where:

$W$  : Total load, in kN, transmitted through the stiffener connection to the PSM, taken equal to:

$$W = \frac{P_1 S_1 \left( S_1 - \frac{S_1}{2000} \right) + P_2 S_2 \left( S_2 - \frac{S_2}{2000} \right)}{2 \sin \phi_{W1} \sin \phi_{W2}} 10^{-3}$$

$P_1, P_2$  : Design pressures applied on the stiffener for the design load set being considered, in kN/m<sup>2</sup>, on each side of the considered connection. For bottom slamming, stern slamming or bow impact loads,  $P_1$  and  $P_2$  are the design pressure as defined in Ch 5, Sec 5, [4.2] and Ch 5, Sec 5, [4.3] respectively.

$S_1, S_2$  : Spacings, in m, between the considered and the adjacent PSM, on each side of the considered connection

$s_1, s_2$  : Spacings of the stiffener, in mm, on each side of the considered connection

$\alpha_a$  : Panel aspect ratio, equal to:

$$\alpha_a = \frac{s}{1000 S}$$

without being taken greater than 0,25, with:

$$s = \frac{s_1 + s_2}{2}$$

$$S = \frac{S_1 + S_2}{2}$$

$\phi_{W1}$  : Angle between primary supporting member and attached plating, in deg, as defined in Ch 4, Sec 6.

$\phi_{W2}$  : Angle between stiffener and attached plating, in deg, as defined in Ch 4, Sec 6.

$A_1$  : Effective net shear area, in cm<sup>2</sup>, of the connection, to be taken equal to:

- in general:  $A_1 = A_{1d} + A_{1c}$
- in case of a slit type slot connections area:  $A_1 = 2 A_{1d}$
- in case of a typical double lug or collar plate connection area:  $A_1 = 2 A_{1c}$

$A_{1d}$  : Net shear connection area, in cm<sup>2</sup>, excluding lug or collar plate, given by:  $A_{1d} = \ell_d t_w 10^{-2}$

$\ell_d$  : Length of direct connection between stiffener and PSM web, in mm

$t_w$  : Net web thickness of the primary supporting member, in mm

$A_{1c}$  : Net shear connection area, in cm<sup>2</sup>, with lug or collar plate, given by:  $A_{1c} = f_1 \ell_c t_c 10^{-2}$

$\ell_c$  : Length of connection between lug or collar plate and PSM, in mm

$t_c$  : Net thickness of lug or collar plate, in mm, not to be taken greater than the net thickness of the adjacent PSM web

$f_1$  : Shear stiffness coefficient, taken equal to:

- for stiffeners of symmetrical cross-section:  $f_1 = 1,0$
- for stiffeners of asymmetrical cross-section:  $f_1 = 140/w$  without being taken greater than 1,0

$w$  : Width of the cut-out for an asymmetrical stiffener, measured from the cut-out side of the stiffener web, in mm, as indicated in Fig 10

$A_w$  : Effective net cross-sectional area, in cm<sup>2</sup>, of the PSM web stiffener in way of the connection, including backing bracket where fitted, as shown in Fig 11. If the PSM web stiffener incorporates a soft heel ending or soft heel and soft toe ending,  $A_w$  is to be measured at the throat of the connection, as shown in Fig 11

$f_c$  : Collar load factor taken equal to:

- for intersecting stiffeners of symmetrical cross-section:
  - for  $A_w \leq 14$ :  $f_c = 1,85$
  - for  $14 < A_w \leq 31$ :  $f_c = 1,85 - 0,0441 (A_w - 14)$
  - for  $31 < A_w \leq 58$ :  $f_c = 1,10 - 0,0130 (A_w - 31)$
  - for  $A_w > 58$ :  $f_c = 0,75$
- for intersecting stiffeners of asymmetrical cross-section:

$$f_c = 0,68 + 0,0172 \frac{\ell_s}{A_w}$$

$\ell_s$  : Connection length, in mm, equal to:

- for a single lug or collar plate connection to the PSM:  $\ell_s = \ell_c$
- for a single sided direct connection to the PSM:  $\ell_s = \ell_d$
- in case of a lug or collar plus a direct connection:  $\ell_s = 0,5 (\ell_c + \ell_d)$ .

**5.2.3** The load  $W_2$ , in kN, transmitted through the PSM web stiffener is to be taken as:

- for web stiffener connected to the intersecting stiffener:

$$W_2 = W \left( 1 - \alpha_a - \frac{A_1}{4 f_c A_w + A_1} \right)$$

- for web stiffener not connected to the intersecting stiffener:

$$W_2 = 0$$

where:

$W, \alpha_a, A_1, f_c, A_w$ : As defined in [5.2.2].

The values of  $A_w, A_{wc}$  and  $A_1$  are to be such that the calculated stresses satisfy the following criteria:

- for a connection to the PSM web stiffener not in way of the weld:  $\sigma_w \leq \sigma_{perm}$
- for a connection to the PSM web stiffener in way of the weld:  $\sigma_{wc} \leq \sigma_{perm}$
- for a shear connection to the PSM web:  $\tau_w \leq \tau_{perm}$

where:

$\sigma_w$  : Direct stress, in N/mm<sup>2</sup>, in the PSM web stiffener at the minimum bracket area away from the weld connection:

$$\sigma_w = \frac{10W_2}{A_w}$$

$\sigma_{wc}$  : Direct stress, in N/mm<sup>2</sup>, in the PSM web stiffener in way of the weld connection:

$$\sigma_{wc} = \frac{10 W_2}{A_{wc}}$$

with:

$A_{wc}$  : Effective net area, in cm<sup>2</sup>, of the PSM web stiffener in way of the weld, as shown in Fig 11

$\tau_w$  : Shear stress, in N/mm<sup>2</sup>, in the shear connection to the PSM web:

$$\tau_w = \frac{10 W_1}{A_1}$$

$\sigma_{perm}$  : Permissible direct stress, in N/mm<sup>2</sup>, given in Tab 1 for AC-1, AC-2, AC-3 and AC-4

$\tau_{perm}$  : Permissible shear stress, in N/mm<sup>2</sup>, given in Tab 1 for AC-1, AC-2, AC-3 and AC-4.

**5.2.4** Where a backing bracket is fitted in addition to the PSM web stiffener, it is to be aligned with the web stiffener. The arm length of the backing bracket is not to be less than the depth of the web stiffener. The net cross-sectional area through the throat of the bracket is to be included in the calculation of  $A_w$  as shown in Fig 11.

**5.2.5** Lapped connections of PSM web stiffeners or tripping brackets to stiffeners are to be avoided as far as possible in the central part.

**5.2.6** Where built-up stiffeners have their face plate welded to the side of the web, a symmetrical arrangement of connection to the PSM is to be fitted. This may be achieved by fitting backing brackets on the opposite side of the PSM or bulkhead. The PSM web stiffener and backing brackets are to be butt welded to the intersecting stiffener web.

**Table 1 : Permissible stresses for connection between stiffeners and PSMs**

Item	Direct stress $\sigma_{perm}$ in N/mm <sup>2</sup>			Shear stress $\tau_{perm}$ in N/mm <sup>2</sup>		
	Acceptance criteria set			Acceptance criteria set		
	AC-1	AC-2	AC-3 AC-4	AC-1	AC-2	AC-3 AC-4
PSM web stiffener	0,83 $R_{eH}$ (2)	$R_{eH}$	$R_{eH}$	–	–	–
PSM web stiffener to intersecting stiffener in way of weld connection:						
• double continuous fillet	0,58 $R_{eH}$ (2)	0,70 $R_{eH}$ (2)	$R_{eH}$	–	–	–
• partial penetration weld	0,83 $R_{eH}$ (1) (2)	$R_{eH}$ (1)	$R_{eH}$	–	–	–
PSM web stiffener to intersecting stiffener in way of lapped welding	0,50 $R_{eH}$	0,60 $R_{eH}$	$R_{eH}$	–	–	–
Shear connection including lugs or collar plates:						
• single-sided connection	–	–	–	0,71 $\tau_{eH}$	0,85 $\tau_{eH}$	$\tau_{eH}$
• double-sided connection	–	–	–	0,83 $\tau_{eH}$	$\tau_{eH}$	$\tau_{eH}$

(1) The root face is not to be greater than one third of the gross thickness of the PSM web stiffener.  
(2) The permissible stresses may be increased by 5% where a soft heel is provided in way of the heel of the PSM web stiffener.

Figure 11 : Primary supporting member web stiffener details

$t_{ws}$ ,  $t_{ws1}$ ,  $t_{ws2}$  : Net thickness of the primary supporting member web stiffener/backing bracket, in mm

$d_w$ ,  $d_{w1}$ ,  $d_{w2}$  : Minimum depth of the primary supporting member web stiffener/backing bracket, in mm

$d_{wc}$ ,  $d_{wc1}$ ,  $d_{wc2}$  : Length of connection between the primary supporting member web stiffener/backing bracket and the stiffener, in mm

$t_f$  : Net thickness of the flange, in mm. For bulb profile,  $t_f$  is to be taken as defined in Ch 4, Sec 6, [1.4.1].

**Table 2 : Weld factor  $w_f$  for connection between stiffeners and PSMs**

Item	Acceptance criteria	Weld factor $w_f$
PSM web stiffener to intersecting stiffener	AC-1 AC-2 AC-3	$0,6 \sigma_{wc} / \sigma_{perm}$ not to be less than 0,38
Shear connection inclusive of lug or collar plate		0,38
Shear connection inclusive of lug or collar plate, where the web stiffener of the PSM is not connected to the intersecting stiffener	AC-4	$0,6 \tau_w / \tau_{perm}$ not to be less than 0,44

**Note 1:**  
 $\sigma_{wc}$  : Stress, in N/mm<sup>2</sup>, as defined in [5.2.3]  
 $\sigma_{perm}$  : Permissible direct stress, in N/mm<sup>2</sup>, see Tab 1  
 $\tau_w$  : Shear stress, in N/mm<sup>2</sup>, as defined in [5.2.3]  
 $\tau_{perm}$  : Permissible shear stress, in N/mm<sup>2</sup>, see Tab 1

**Figure 12 : Offset PSM web stiffeners**

**5.2.7** Where the web stiffener of the PSM is parallel to the web of the intersecting stiffener but not connected to it, the offset PSM web stiffener is to be located in close proximity to the slot edge as shown in Fig 12. The ends of the offset web stiffeners are to be suitably tapered and softened.

**5.2.8** The size of the fillet welds is to be calculated according to Ch 13, Sec 3, [3.2.6] based on the weld factor  $w_f$  given in Tab 2. For the welding in way of the shear connection, the size is not to be less than that required for the PSM web plate for the location under consideration.

## 6 Openings

### 6.1 Openings and scallops in stiffeners

**6.1.1** Fig 13 shows examples of air holes, drain holes and scallops. In general, the ratio  $a/b$ , as defined in Fig 13, is to be between 0,5 and 1,0. In fatigue sensitive areas, further consideration may be required with respect to the details and arrangements of openings and scallops.

In general, scallops & drain holes are to be kept as small as practicable.

**6.1.2** Openings and scallops are to be kept (see Fig 14):

- at least 200 mm clear of the toes of end brackets, end connections and other areas of high stress concentration, measured along the length of the stiffener toward the mid-span, and
- at least 50 mm measured along the length in the opposite direction.

In areas where the shear stress is less than 60% of the permissible stress, alternative arrangements may be accepted.

**Figure 13 : Examples of air holes, drain holes and scallops**

Figure 14 : Location of air and drain holes

**6.1.3** Closely spaced scallops or drain holes, i.e. where the distance between scallops/drain holes is less than twice the width  $b$  as shown in Fig 13, are not permitted in stiffeners contributing to the longitudinal strength.

For the other stiffeners, closely spaced scallops/drain holes are not permitted within 20% of the stiffener span measured from the end of the stiffener. Widely spaced air or drain holes may be permitted, provided they are of elliptical shape or equivalent to minimise stress concentration and they are cut clear of the welds.

## 6.2 Openings in primary supporting members

### 6.2.1 General

Manholes, lightening holes and other similar openings are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are to be avoided in high stress areas, unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory.

Examples of high stress areas include:

- floors or double bottom girders close to their span ends or in way of cargo hold bulkheads
- primary supporting member webs in way of end bracket toes
- above the heads and below the heels of pillars.

Where openings are arranged, their shape is to be such that the stress concentration remains within the acceptable limits.

Openings are to be well rounded, with smooth edges.

### 6.2.2 Manholes and lightening holes

The web openings do not require reinforcement:

- in single skin sections: when the openings have depth not exceeding 25% of the web depth and are so located that the edges are not at less than 40% of the web depth from the face plate
- in double skin sections: when the openings have depth not exceeding 50% of the web depth and are so located that the edges are well clear of cut-outs for the passage of stiffeners.

The opening length is not to be greater than:

- at mid-span of primary supporting members: the distance between the adjacent openings
- at ends of the span: 25% of the distance between the adjacent openings
- for openings cut in single skin sections: the web depth or 60% of the stiffener spacing, whichever is greater.

The ends of the openings are to be equidistant from the cut-outs for the passage of stiffeners.

Where lightening holes are cut in the brackets, the distance from the hole circumference to the bracket free flange is not to be less than the diameter of the lightening hole.

Openings not complying with the above requirement are to be reinforced according to [6.2.3].

### 6.2.3 Reinforcements around openings

Manholes and lightening holes are to be stiffened according to this requirement, except where alternative arrangements are demonstrated as satisfactory, in accordance with the analysis methods described in Part B, Chapter 8.

On members contributing to longitudinal strength, stiffeners are to be fitted alongside the opening free edges and parallel to the vertical and horizontal axes of the opening. See Fig 15. Edge reinforcement may be used as an alternative to the stiffeners.

Stiffeners may be omitted:

- in one direction if the shortest dimension of the opening is less than 400 mm, and
- in both directions if the sum of the dimensions (length plus width) of the opening is less than 300 mm.

In the case of large openings in the web of PSMs (e.g. where a pipe tunnel is fitted in the double bottom), the secondary stresses in PSMs are to be considered for the reinforcement of these openings.

Where no FE analysis is performed, this may be carried out by assigning an equivalent net shear sectional area to the PSM obtained, in cm<sup>2</sup>, according to the following formula:

$$A_{s-n50} = \frac{A_{1-n50}}{1 + \frac{32 \ell_{shr}^2 A_{1-n50}}{I_{1-n50}}} + \frac{A_{2-n50}}{1 + \frac{32 \ell_{shr}^2 A_{2-n50}}{I_{2-n50}}}$$

where:

$I_{1-n50}, I_{2-n50}$  : Net moments of inertia, in cm<sup>4</sup>, of deep webs (1) and (2), respectively, with attached plating around their neutral axes parallel to the plating

$A_{1-n50}, A_{2-n50}$  : Net shear sectional areas, in cm<sup>2</sup>, of deep webs (1) and (2), respectively, taking account of the web height reduction by the depth of the cut-outs for the passage of the ordinary stiffeners, if any

$\ell_{shr}$  : Shear span, in m, of deep webs (1) and (2) as defined in Ch 4, Sec 6, [1.1.7].

Deep web (1) and (2) are defined in Fig 16.

**Figure 15 : Web plate with openings**

**Figure 16 : Large openings in the web of primary supporting members**

Figure 17 : Large openings in primary supporting members - Secondary stresses

**6.2.4** In the case of large openings as shown in Fig 17, the secondary stresses in primary supporting members are to be considered for the reinforcement of the openings.

The secondary stresses may be calculated in accordance with the following procedure.

Members (1) and (2) are subjected to the following forces, moments and stresses:

$$F = \frac{M_A + M_B}{2d}$$

$$m_1 = \left| \frac{M_A - M_B}{2} \right| K_1$$

$$m_2 = \left| \frac{M_A - M_B}{2} \right| K_2$$

$$\sigma_{F1} = 10 \frac{F}{S_1}$$

$$\sigma_{F2} = 10 \frac{F}{S_2}$$

$$\sigma_{m1} = \frac{m_1}{w_1} 10^3$$

$$\sigma_{m2} = \frac{m_2}{w_2} 10^3$$

$$\tau_1 = 10 \frac{K_1 Q_T}{S_{w1}}$$

$$\tau_2 = 10 \frac{K_2 Q_T}{S_{w2}}$$

where:

$M_A, M_B$  : Bending moments, in kN.m, in sections A and B of the primary supporting member

$m_1, m_2$  : Bending moments, in kN.m, in (1) and (2)

$d$  : Distance, in m, between the neutral axes of (1) and (2)

$\sigma_{F1}, \sigma_{F2}$  : Axial stresses, in N/mm<sup>2</sup>, in (1) and (2)

$\sigma_{m1}, \sigma_{m2}$  : Bending stresses, in N/mm<sup>2</sup>, in (1) and (2)

$Q_T$  : Shear force, in kN, equal to  $Q_A$  or  $Q_B$ , whichever is greater

$\tau_1, \tau_2$  : Shear stresses, in N/mm<sup>2</sup>, in (1) and (2)

$w_1, w_2$  : Net section moduli, in cm<sup>3</sup>, of (1) and (2)

$S_1, S_2$  : Net sectional areas, in cm<sup>2</sup>, of (1) and (2)

$S_{w1}, S_{w2}$  : Net sectional areas, in cm<sup>2</sup>, of webs in (1) and (2)

$I_1, I_2$  : Net moments of inertia, in cm<sup>4</sup>, of (1) and (2) with attached plating

$$K_1 = \frac{I_1}{I_1 + I_2}$$

$$K_2 = \frac{I_2}{I_1 + I_2}$$

The combined stress  $\sigma_c$  calculated at the ends of members (1) and (2) is to be obtained from the following formula:

$$\sigma_c = \sqrt{(\sigma_F + \sigma_m)^2 + 3\tau^2}$$

The combined stress  $\sigma_c$  is to comply with the checking criteria in Ch 7, Sec 6 or Ch 8, App 1, [5.2.3], as applicable. Where these checking criteria are not complied with, the cut-out is to be reinforced according to one of the solutions shown in Fig 18 to Fig 20:

- continuous face plate (solution 1): see Fig 18
- straight face plate (solution 2): see Fig 19
- compensation of the opening (solution 3): see Fig 20
- combination of the above solutions.

Other arrangements may be accepted provided they are supported by direct calculations submitted to the Society for review.

**Figure 18 : Stiffening of large openings in primary supporting members - Solution 1**

**Figure 20 : Stiffening of large openings in primary supporting members - Solution 3**

Inserted plate

### 6.3 Openings in strength deck

#### 6.3.1 General

Openings in the strength deck are to be kept to a minimum and spaced as far as practicable from one another and from the ends of superstructures. Openings are to be located as far as practicable from high stress regions such as side shell platings, hatchway corners, or hatch side coamings.

**6.3.2 Small opening location**

Small openings are generally to be located outside the shaded areas shown in Fig 21 and defined by:

- the bent area of a rounded sheer strake, if any, or the side shell
- the transverse distance  $e$ , from the longitudinal edge of the hatchway, equal to:  
 $e = 0,25 (B - b)$
- the longitudinal distance  $c$ , from the transverse edge of the hatchway, equal to:  
 $c = 0,07 \ell + 0,1 b$  or  $0,25 b$ , whichever is greater
- the transverse distance  $g_i$ , measured from the limit of the shaded areas at the connection between deck and side, equal to:
  - for a circular opening:  $g_i = 2 a_i$
  - for an elliptical opening:  $g_i = a_i$

where (see Fig 21):

- $a_i$  : Transverse dimension, in m, of the small opening  $i$  considered
- $b$  : Width, in m, of the hatchway considered, measured in the transverse direction
- $\ell$  : Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction.

Distances between small openings are not to be less than:

- a) in longitudinal direction (see openings 1 and 3 in Fig 22):
  - $(a_1 + a_3)$  for circular openings
  - $0,75 (a_1 + a_3)$  for elliptical openings and for an elliptical opening in line with a circular one
- b) in transverse direction (see openings 1 and 2 in Fig 22):
  - $2,0 (a_1 + a_2)$  for circular openings
  - $1,5 (a_1 + a_2)$  for elliptical openings and for an elliptical opening in line with a circular one

If the opening arrangements do not comply with these requirements, the hull girder longitudinal strength assessment is to be carried out by subtracting such opening areas, see Ch 6, Sec 1, [1.2].

**Figure 21 : Position of small openings with respect to sides and hatchways in the strength deck**

Figure 22 : Distances between small openings in the strength deck

## 6.4 Corners of hatchways

**6.4.1** For hatchways located within the cargo area, insert plates, whose thickness is to be determined according to [6.4.3], are generally to be fitted in way of corners where the plating cut-out has a circular profile.

The radius of circular corners is to be not less than:

- 5% of the hatch width, where a continuous longitudinal deck girder is fitted below the hatch coaming
- 8% of the hatch width, where no continuous longitudinal deck girder is fitted below the hatch coaming.

Corner radiusing, in the case of the arrangement of two or more hatchways athwartship, is considered by the Society on a case by case basis.

**6.4.2** For hatchways located in the positions specified in [6.4.1], insert plates are, in general, not required in way of corners where the plating cut-out has an elliptical or parabolic profile and the half axes of elliptical openings, or the half lengths of the parabolic arch, are not less than:

- 1/20 of the hatchway width or 600 mm, whichever is the lesser, in the transverse direction
- twice the transverse dimension, in the fore and aft direction.

**6.4.3** Where insert plates are required, their thickness is obtained, in mm, from the following formula:

$$t_{INS} = \left(0,8 + 0,4 \frac{\ell}{b}\right)t$$

without being taken less than  $t$  or greater than  $1,6t$

where:

- $\ell$  : as defined in [6.3.2].
- $b$  : as defined in [6.3.2].
- $t$  : Actual thickness, in mm, of the deck at the side of the hatchways.

For the extreme corners of end hatchways, the thickness of insert plates is to be 60% greater than the actual thickness of the adjacent deck plating. A lower thickness may be accepted by the Society on the basis of calculations showing that stresses at hatch corners are lower than permissible values.

**6.4.4** Where insert plates are required, the arrangement shown in Ch 13, App 2, Tab 66 is to be complied with.

**6.4.5** For hatchways located in positions other than those in [6.4.1], a reduction in the thickness of the insert plates in way of corners may be considered by the Society on a case by case basis.

## 6.5 Openings in shell plating

### 6.5.1 Position of openings

Openings in the shell plating are to be located at a vertical distance from the deck at side, taken under the bent area of the rounded sheer strake if any, not less than:

- two times the opening diameter, in case of circular openings
- the transverse dimension of the opening (along the minor axis), in case of elliptical openings.

See also Fig 21.

### **6.5.2 Local strengthening**

Openings in the ship sides, e.g. for pilot doors, are to be well rounded at the corners and located well clear of superstructure ends or of any openings in the deck areas at sides of hatchways.

Openings for sea intakes are to be well rounded at the corners and, within 0,6 L amidships, located outside the bilge strakes. Where arrangements are such that sea intakes are unavoidably located in the curved zone of the bilge strakes, such openings are to be elliptical with the major axis in the longitudinal direction. Openings for stabiliser fins are considered by the Society on a case-by-case basis. The thickness of the sea chests is to be generally that of the local shell plating, but in no case less than 12 mm. Above mentioned openings, when deemed necessary by the Society, other openings may be adequately compensated by means of insert plates of increased thickness or doublers sufficiently extended in length. Such compensation is to be partial or total, depending on the stresses occurring in the area of the openings.

Circular openings on the sheer strake need not be compensated where their diameter does not exceed 20% of the sheer strake minimum width as defined in [8.1.4], or 380 mm, whichever is the lesser, and where they are located away from openings on deck at side of hatchways and away from superstructure ends.

## **7 Bottom structure**

### **7.1 General**

#### **7.1.1 Framing system**

For ships greater than 120 m in length, the bottom shell and the inner bottom are to be longitudinally stiffened within the central part. Where it is not practicable to apply a longitudinal framing system to fore and aft parts of the central part due to the hull form, transverse framing may be accepted on a case-by-case basis, subject to appropriate brackets and other arrangements being incorporated to provide structural continuity in way of the changes to the framing system.

#### **7.1.2 Variation in height of double bottom**

Any variation in the double bottom height is to be made gradually and over an acceptable length; the knuckles of inner bottom plating are to be located in way of double bottom floors. Where such arrangement is not possible, longitudinal structures, such as partial girders, longitudinal brackets, fitted across the knuckle, are to be arranged.

#### **7.1.3 Drainage of tank top**

Effective arrangements are to be provided for draining water from the tank top. Where wells are provided for the drainage, such wells are not to extend over more than one-half height of double bottom.

#### **7.1.4 Striking plate**

Striking plates of adequate thickness or other equivalent arrangements are to be provided under sounding pipes to prevent the sounding rod from damaging the plating.

#### **7.1.5 Duct keel**

Where a duct keel is arranged, the centre girder may be replaced by two girders spaced not more than 3 m apart. Otherwise, for a spacing wider than 3 m, the two girders are to be provided with support of the adjacent structure and subject to the Society's approval.

The structures in way of the floors are to provide sufficient continuity of the latter.

### **7.2 Keel plate**

**7.2.1** Keel plating is to extend over the flat part of the bottom for the full length of the ship.

The width of the keel, in m, is not to be less than:

$0,8 + L/200$ , without being taken greater than 2,3 m.

### **7.3 Girders**

#### **7.3.1 Centre girder**

When fitted, the centre girder is to extend within the central part and is to extend forward and aft as far as practicable. Structural continuity of the centre girder is to be maintained within the full length of the ship.

#### **7.3.2 Side girders**

The side girders are to extend within the parallel part of the central part and are to extend forward and aft of the central part as far as practicable.

### **7.4 Floors**

#### **7.4.1 Web stiffeners**

Where the web stiffeners are not welded to the longitudinal stiffeners, fatigue strength assessment for the cut-out and connection of longitudinal stiffeners may be required.

**7.4.2 Floor spacing**

Floors are also to be fitted in way of the watertight bulkheads.  
For transversally framed bottom, floors are to be fitted at every frame.

**7.5 Open floors**

**7.5.1** Open floors may be fitted in way of intermediate frames, consisting of a frame connected to the bottom plating and a reverse frame connected to the inner bottom plating (See Fig 23).

**7.5.2** Open floors are to be attached to the centreline girder and to the margin plate by means of flanged brackets having a width of flange not less than 1/10 of the local double bottom height.

**7.5.3** Where frames and reverse frames are interrupted in way of girders, double brackets are to be fitted.

**Figure 23 : Open floor**

**7.6 Bilge keel**

**7.6.1 Material**

The material of the bilge keel and that of the ground bar is to be at least of the same yield stress as the material of the bilge plating to which they are attached.

In addition, when the bilge keel extends over a length greater than 0,15 L, the material of the ground bar and that of the bilge keel are to be, at least, of the same grade and of the same material class as the material of the bilge plating to which they are attached.

**7.6.2 Design**

The design of single web bilge keels is to be such that failure to the web occurs before failure of the ground bar. This may be achieved by ensuring that following conditions are both satisfied:

- the web thickness of the bilge keel does not exceed that of the ground bar
- the yield stress of the material of the bilge keel does not exceed that of the ground bar.

In general, scallops and cut-outs are not to be used. Crack arresting holes are to be drilled in the bilge keel butt welds as close as practicable to the ground bar. The diameter of the hole is to be greater than the width W of the butt weld and is to be a minimum of 25 mm (see Fig 24). Where the butt weld has been subject to non-destructive examination, the crack arresting hole may be omitted.

Bilge keels of a design different from that shown in Fig 24 are to be specially considered by the Society.

**Figure 24 : Bilge keel construction**

7.6.3 Ground bars

Bilge keels are not to be welded directly to the shell plating. A ground bar, or doubler, is to be fitted on the shell plating as shown in Fig 24 to Fig 26. In general, the ground bar is to be continuous.

The gross thickness of the ground bar is not to be less than the gross thickness of the bilge plating or 14 mm, whichever is the lesser.

Figure 25 : Bilge keel and design

Figure 26 : Bilge keel and design

#### 7.6.4 End details

The ground bar and bilge keel ends are to be tapered or rounded. Tapering is to be gradual with a minimum ratio of 3:1, see Fig 25 items (a) and (b), and Fig 26 items (d) and (e). Rounded ends are to be as shown in Fig 25, item (c). Cut-outs on the bilge keel web within zone A (see Fig 25 item (b) and Fig 26 item (e)) are not permitted.

The end of the bilge keel web is to be not less than 50 mm and not greater than 100 mm from the end of the ground bar, see Fig 25 item (a) and Fig 26 item (d).

Ends of the bilge keel and ground bar are to be supported by either transverse or longitudinal members inside the hull, as indicated as follows:

- transverse support member is to be fitted at mid-length between the end of the bilge keel web and the end of the ground bar, see Fig 25 items (a), (b) and (c)
- longitudinal stiffener is to be fitted in line with the bilge keel web, it is to extend to at least the nearest transverse member forward and aft of zone A (see Fig 25 item (b) and Fig 26 item (e)).

Alternative end arrangements may be considered by the Society on a case by case basis.

## **7.7 Docking**

### **7.7.1 General**

The dry docking arrangement itself is not covered by these Rules.

## **8 Side structure**

### **8.1 Structural arrangement**

#### **8.1.1 Primary supporting members**

Side or double side web frames are to be fitted in line with the bottom web frames. Alternative framing arrangements may be considered by the Society on a case by case basis.

For double side arrangement, a vertical framing is to be fitted in way of the structure of the transverse bulkheads.

#### **8.1.2 Longitudinal stiffeners**

The longitudinal stiffeners on side shell and inner hull, where fitted, are to be continuous within the length of the parallel part of the central part. They are to be effectively connected to the transverse web frames and bulkheads of the double side structure.

Longitudinal framing of the side shell is to extend outside the central part, as far forward as practicable.

#### **8.1.3 Transverse stiffeners**

The transverse stiffeners on side shell and inner hull, where fitted, are to be continuous or fitted with bracket end connections. At their upper and lower ends, the shell and inner hull transverse stiffeners are to be connected by brackets to the supporting stringer plates.

#### **8.1.4 Sheer strake**

Sheer strakes are to have breadths, in m, not less than  $0,8 + L/200$ , measured vertically, but need not be greater than 1,8 m.

The sheer strake may be either welded to the stringer plate or rounded.

If the sheer strake is rounded, its radius, in mm, is to be not less than  $17 t_s$ , where:

$t_s$  : Net thickness, in mm, of the sheer strake.

The upper edge of the welded sheer strake is to be rounded, smooth and free of notches. Fixtures, such as bulwarks and eye plates, are not to be directly welded on the upper edge of the sheer strake, except in fore and aft parts. Drainage openings with a smooth transition in the longitudinal direction may be permitted.

Longitudinal seam welds of rounded sheer strake are to be located outside the bent area at a distance not less than 5 times the maximum net thickness of the sheer strake.

The welding of deck fittings to rounded sheer strakes is to be avoided within  $0,6 L$  amidships.

The transition from a rounded sheer strake to an angled sheer strake associated with the arrangement of superstructures is to be designed to avoid any discontinuities.

## **9 Deck structure**

### **9.1 Structural arrangement**

#### **9.1.1 Framing system**

For ships greater than 120 m in length, deck areas contributing to the longitudinal strength are to be longitudinally framed.

Transverse framing may be accepted on a case-by-case basis subject to appropriate brackets and other arrangements being incorporated to provide structural continuity in way of changes to the framing system.

#### **9.1.2 Stringer plate**

Stringer plates are to have breadths, in m, not less than  $0,8 + L/200$ , measured horizontally, but need not be greater than 1,8 m.

Rounded stringer plates, where adopted, are to comply with the requirements in [8.1.4].

#### **9.1.3 Connection of deckhouses and superstructures**

Connection of the deckhouses and superstructures to the strength deck is to be so designed that loads are transmitted to the supporting structure under deck.

## **10 Bulkhead structure**

### **10.1 Application**

**10.1.1** The requirements of this Article apply to longitudinal and transverse bulkheads, which may be plane or corrugated.

## 10.2 Plane bulkheads

### 10.2.1 General

The bulkheads are to be stiffened in way of the deck girders.

The horizontally framed bulkheads are made of horizontal stiffeners supported by vertical primary supporting members.

The vertically framed bulkheads are made of vertical stiffeners supported by horizontal stringers, if needed.

The crossing of stiffeners through a watertight bulkhead is to be watertight.

Bulkheads that support girders or pillars and longitudinal bulkheads which are fitted in lieu of girders are to be stiffened to provide supports not less effective than required for stanchions or pillars that would be located at the same position.

Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way of the connection are to be adequate for the loads imparted to the bulkheads by the hydraulic forces in the pipes.

### 10.2.2 End connection of stiffeners

End connections of stiffeners are to be bracketed or welded to the supporting member.

For isolated areas where bracketed or welded end connections cannot be applied due to hull lines, other arrangements including sniped ends are acceptable.

Sniped ends may be used for stiffeners on bulkheads subject to hydrostatic pressure, provided they comply with [3.4].

## 10.3 Corrugated bulkheads

### 10.3.1 General

Transverse vertically corrugated watertight bulkheads are to be fitted with a lower stool, and generally with an upper stool below deck in the following cases:

- bulkheads normally submitted to liquid pressure, e.g. tank bulkheads and ballast hold bulkheads on ships of 16 m moulded depth and above; and
- any bulkhead on ships of 18 m moulded depth and above.

Otherwise corrugations may extend from inner bottom to deck.

### 10.3.2 Construction

The main dimensions  $b_{f-cg}$ ,  $R$ ,  $b_{w-cg}$ ,  $d_{cg}$ ,  $t_f$ ,  $t_w$ ,  $s_{cg}$  of corrugated bulkheads are defined in Fig 27.

The corrugation angle  $\phi$  is not to be less than 55°.

When welds in a direction parallel to the bend axis are provided in the zone of the bend, the welding procedures are to be submitted to the Society for approval.

### 10.3.3 Corrugated bulkhead depth

The depth of the corrugation,  $d_{cg}$ , in mm, is not to be less than:

$$d_{cg} = \frac{1000 \ell_c}{C}$$

where:

$\ell_c$  : Mean span of considered corrugation, in m, as defined in [10.3.5].

$C$  : Coefficient to be taken as:

- $C = 15$  for tank and water ballast cargo hold bulkheads.
- $C = 18$  for dry cargo hold bulkheads.

### 10.3.4 Actual section modulus of corrugations

The net section modulus of a corrugation may be obtained, in  $\text{cm}^3$ , from the following formula:

$$Z = \left[ \frac{d_{cg}(3b_{f-cg}t_f + b_{w-cg}t_w)}{6} \right] 10^{-3}$$

where:

$t_f$ ,  $t_w$  : Net thickness of the plating of the corrugation, in mm, shown in Fig 27.

$d_{cg}$ ,  $b_{f-cg}$ ,  $b_{w-cg}$ : Dimensions of the corrugation, in mm, shown in Fig 27.

Where the web continuity is not ensured at ends of the bulkhead, the net section modulus of a corrugation is to be obtained, in  $\text{cm}^3$ , from the following formula:

$$Z = 0.5b_{f-cg}t_f d_{cg} 10^{-3}$$

**10.3.5 Span of corrugations**

The span  $l_c$  of the corrugations is to be taken as the distance shown in Fig 28.

For the definition of  $l_c$ , the bottom of the upper stool is not to be taken more than a distance from the deck at the centre line equal to:

- 3 times the depth of corrugation, for non rectangular stool.
- 2 times the depth of corrugation, for rectangular stool.

**10.3.6 Structural arrangements**

Where corrugated bulkheads are cut in way of primary supporting members, corrugations on each side of the primary member are to be aligned with each other.

**Figure 27 : Dimensions of a corrugated bulkhead**

**Figure 28 : Span of the corrugations**

**10.3.7 Bulkhead end supports**

The strength continuity of corrugated bulkheads is to be maintained at the ends of corrugations.

Where a bulkhead is provided with a lower stool, floors or girders are to be fitted in line with both sides of the lower stool. Where a bulkhead is not provided with a lower stool, floors or girders are to be fitted in line with both flanges of the vertically corrugated transverse bulkhead.

The supporting floors or girders are to be connected to each other by suitably designed shear plates.

At deck, if no upper stool is fitted, transverse or longitudinal stiffeners are to be fitted in line with the corrugation flanges.

When the corrugation flange connected to the adjoining boundary structures (i.e. inner hull, side shell, longitudinal bulkhead, trunk, etc) is smaller than 50% of the width of the typical corrugation flange, an advanced analysis of the connection is required.

**10.3.8 Bulkhead stools**

Stool side plating is to be aligned with the corrugation flanges.

**10.3.9 Lower stool**

The lower stool, when fitted, is to have a height not less than:

- 3 corrugation depths for dry cargo hold bulkheads.
- one corrugation depth for tank and water ballast cargo hold bulkheads.

The ends of stool side ordinary stiffeners, when fitted in a vertical plane, are to be attached to brackets at the upper and lower ends of the stool. Lower stool side vertical stiffeners and their brackets in the stool are to be aligned with the inner bottom structures such as longitudinals or similar. Lower stool side plating is not to be knuckled anywhere between the inner bottom plating and the stool top plate.

The distance  $d$  from the edge of the stool top plate to the surface of the corrugation flange is to be in accordance with the distance shown on Fig 29.

The lower part of the stool side plates is to be in line with double bottom floors or girders as the case may be, and the stool bottom is to have a width not less than:

- 2.5 corrugation depths for dry cargo hold bulkheads.
- one corrugation depth for tank and water ballast cargo hold bulkheads.

The stool is to be fitted with diaphragms in line with the longitudinal double bottom girders or floors. Scallops in the brackets and diaphragms in way of the connections to the stool top plate are to be avoided.

The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or partial penetration welds. The supporting floors are to be connected to the inner bottom by either full penetration or partial penetration welds.

**Figure 29 : Permitted distance,  $d$ , from the edge of the stool top plate to the surface of the corrugation flange**

**10.3.10 Upper stool**

The upper stool, when fitted, is to have a height:

- Not less than two times the corrugation depth for dry cargo hold bulkheads.
- At least one corrugation depth for tank and water ballast cargo hold bulkheads.

Rectangular stools are to have a height in general equal to twice the depth of corrugations, measured from the deck level and at the hatch side girder or at the inner hull as applicable. Brackets or deep webs are to be fitted to connect the upper stool to the deck transverse or hatch end beams.

The upper stool of a transverse bulkhead is to be properly supported by deck girders or deep brackets between the adjacent hatch end beams. The width of the upper stool bottom plate is generally to be the same as that of the lower stool top plate. The stool top of non-rectangular stools of bulk carriers is to have a width not less than twice the depth of corrugations. The ends of stool side ordinary stiffeners when fitted in a vertical plane, are to be attached to brackets at the upper and lower end of the stool.

The stool is to be fitted with diaphragms in line with and effectively attached to longitudinal deck girders extending to the hatch end coaming girders or transverse deck primary supporting members. Scallops in the brackets and diaphragms in way of the connection to the stool bottom plate are to be avoided.

## **10.4 Wash bulkheads**

### **10.4.1 General**

In general, openings in wash bulkheads are to have their aggregate area between 10% and 30% of the bulkhead area.

## **10.5 Watertight bulkheads of trunks and tunnels**

**10.5.1** Watertight bulkheads of trunks, tunnels, duct keels and ventilators are to be of the same strength as watertight bulkheads at corresponding levels. The means used for making them watertight, and the arrangements adopted for closing their openings, are to be to the satisfaction of the Society.

## **10.6 Bulkheads acting as pillars**

**10.6.1** Each vertical stiffener, in association with a width of plating equal to:

- 35 times the plating net thickness
- 1/12 of stiffener length, or
- the stiffener spacing, whichever is the smaller,

is to comply with the applicable requirements in Part B, Chapter 7, for the load being supported.

### **10.6.2 Non-tight corrugated bulkheads**

Where non-tight bulkheads are corrugated, each corrugation is to comply with the applicable requirements in Part B, Chapter 7, for the load being supported.

## **10.7 Watertight doors**

**10.7.1** Where vertical stiffeners are cut in way of watertight doors, reinforced stiffeners are to be fitted on each side of the door and suitably overlapped; cross-bars are to be provided to support the interrupted stiffeners.

## **11 Pillars**

### **11.1 General**

**11.1.1** Wherever possible, pillars are to be fitted in the same vertical line. If not possible, effective means are to be provided for transmitting the pillar loads to the supports below. Effective arrangements are to be made to distribute the loads at the heads and the heels of all the pillars. Where pillars support eccentric loads, they are to be strengthened to withstand the additional bending moment applied on them.

**11.1.2** Pillars connected to the inner bottom are to be fitted at the intersection of girders and floors, or as close thereto as practicable, and the structure above and below the pillars is to be of sufficient strength to provide effective distribution of the load.

Where pillars connected to the inner bottom are not located in way of the intersection of floors and girders, partial floors or girders, or equivalent structures, are to be fitted as necessary to support the pillars.

**11.1.3** In tanks, solid or open section pillars are generally to be fitted. Pillars located in spaces intended for products which may produce explosive gases are to be of open section type.

### **11.2 Connections**

**11.2.1** Heads and heels of the pillars are to be secured by thick doubling plates and brackets, as necessary. Alternative arrangements for doubling plates may be accepted, provided they are considered equivalent, as deemed appropriate by the Society.

Where the pillars are likely to be subjected to tensile loads, heads and heels of the pillars are to be efficiently secured to withstand the tensile loads and the doubling plates are to be replaced by insert plates complying with the through thickness properties requirements in Ch 4, Sec 1, [2.6].

In general, the net thickness of the doubling plates, when fitted, is to be not less than 1,5 times the net thickness of the pillar. Pillars are to be attached at their heads and heels by continuous welding.

**11.2.2 Contact pressure**

At connexions between pillars and decks, it is to be checked that the contact pressure  $\sigma_C$ , in N/mm<sup>2</sup>, is in compliance with the following formula:

$$\sigma_C \leq R_{eH}$$

where:

$$\sigma_C = 10 \frac{F_A}{A_C}$$

with:

- $F_A$  : Compression axial load in the pillar, in kN
- $A_C$  : Contact area between the pillar and the deck structural members, in cm<sup>2</sup>
- $R_{eH}$  : Smallest of the assembled elements yield stress, in N/mm<sup>2</sup>.

# Section 6 Structural Idealisation

## Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

- $\varphi_w$  : Angle, in deg, between the stiffener or the primary supporting member web and the attached plating, see Fig 14.  $\varphi_w$  is to be taken equal to 90° if the angle is greater or equal than 75° and smaller or equal than 105°.
- $\ell_{bdg}$  : Effective bending span, in m, as defined in:
- [1.1.2] for stiffeners, and
  - [1.1.6] for primary supporting members.
- $\ell_{shr}$  : Effective shear span, in m, as defined in:
- [1.1.3] for stiffeners, and
  - [1.1.7] for primary supporting members.
- LCP : Load Calculation Point.

## 1 Structural idealisation of stiffeners and primary supporting members

### 1.1 Effective spans

#### 1.1.1 General

Where arrangements differ from those defined in this Article, the span definition may be specially considered, depending on the actual arrangement at the ends of the stiffeners or primary supporting members.

#### 1.1.2 Effective bending span of stiffeners

The effective bending span  $\ell_{bdg}$  of stiffeners is to be obtained as shown in Fig 1 for single skin structures and in Fig 3 for double skin structures.

If the stiffener on the PSM web is sniped at the end or not attached to the stiffener under consideration, the effective bending span is to be taken as the full length between PSMs unless a backing bracket is fitted, see Fig 1, items a) and b).

The effective bending span may be reduced where brackets are fitted to the flange or free edge of the stiffener. Brackets fitted on the side opposite to that of the stiffener with respect to attached plating are not to be considered as effective in reducing the effective bending span.

In single skin structures, the effective bending span of a stiffener supported by a bracket or by a web stiffener on one side only of the primary supporting member is to be taken as the total span between primary supporting members, as shown in item a) of Fig 1. If brackets are fitted on both sides of the primary supporting member, the effective bending span is to be taken as shown in items b), c) and d) of Fig 1.

Where the face plate of the stiffener is continuous along the edge of the bracket, the effective bending span is to be taken to the position where the depth of the bracket is equal to one quarter of the depth of the stiffener, see Fig 2.

#### 1.1.3 Effective shear span of stiffeners

The effective shear span  $\ell_{shr}$  of stiffeners is to be obtained as shown in Fig 4 for single skin structures and in Fig 6 for double skin structures.

The effective shear span may be reduced for brackets fitted on either the flange or the free edge of the stiffener, or for brackets fitted to the attached plating on the side opposite to that of the stiffener.

If brackets are fitted both on the flange or the free edge of the stiffener and to the attached plating on the side opposite to that of the stiffener, the effective shear span may be reduced using the longer effective bracket arm.

Regardless of the support detail, the full length of the stiffener may be reduced by a length, in m, at least equal to  $s/4000$  at each end of the member, hence the effective shear span  $\ell_{shr}$  is not to be taken greater than:

$$\ell_{shr} \leq \ell - \frac{s}{2000}$$

For curved and/or long brackets (high length/height ratio), the effective bracket length is to be taken as the maximum inscribed 1:1,5 right angled triangle as shown in items c) of Fig 4 and Fig 6.

Where the face plate of the stiffener is continuous along the curved edge of the bracket, the bracket length to be considered for determination of the span point location is not to be taken greater than 1,5 times the length of the bracket arm as shown in Fig 5.

Figure 1 : Single skin construction - Effective bending span  $\ell_{bdg}$  of stiffeners supported by web stiffeners

Figure 2 : Effective bending span  $\ell_{bdg}$  for local support members with continuous face plate along bracket edge

Figure 3 : Double skin construction - Effective bending span  $\ell_{bdg}$  of stiffeners supported by web stiffeners

Figure 4 : Single skin construction - Effective shear span  $l_{shr}$  of stiffeners supported by web stiffeners

Figure 5 : Effective shear span  $l_{shr}$  for local support members with continuous face plate along the bracket edge

Figure 6 : Double skin construction - Effective shear span  $l_{shr}$  of stiffeners supported by web stiffeners

#### 1.1.4 Effect of hull form shape on span of stiffeners

For curved stiffeners, the span is defined as the chord length between span points to be measured at the flange for stiffeners with a flange, and at the free edge for flat bar stiffeners. The calculation of the effective span is to be in accordance with requirements given in [1.1.2] and [1.1.3].

#### 1.1.5 Effective span of stiffeners supported by struts

The arrangement of stiffeners supported by struts is not allowed for ships greater than 120 m in length.

The span  $l$  of the stiffeners supported by one strut fitted at mid-distance of the primary supporting members is to be taken as  $0,7 l_2$ .

In case where two struts are fitted at  $1/3$  and  $2/3$  of the distance between primary supporting members, the span  $l$  of the stiffeners is to be taken as  $0,7 l_2$ .

The spans  $l_1$  and  $l_2$  are defined in Fig 7 and Fig 8.

Figure 7 : Span of stiffeners with one strut

Figure 8 : Span of stiffeners with two struts

### 1.1.6 Effective bending span of primary supporting members

The effective bending span  $l_{bdg}$  of a primary supporting member without end bracket is to be taken as the length of the primary supporting member between supports.

The effective bending span  $l_{bdg}$  of a primary supporting member may be taken as less than the full length of the primary supporting member between supports, provided that suitable end brackets are fitted, i.e.:

- in case of separate welded end brackets,  $l_{bdg}$  is taken as the length between the points where the depth of the brackets is equal to one-half the web height  $h_w$  of the primary supporting member (see item b) of Fig 9)
- in case of end brackets where the face plate of the primary supporting member is continuous along the face of the brackets (see items a), c) and d) of Fig 9),  $l_{bdg}$  is taken as the length between the points where the depth of the brackets is equal to one-quarter the web height  $h_w$  of the primary supporting member.

The end brackets used to determine the span points are to be either the effective brackets as defined in [1.1.8] or the fitted brackets:

- for straight brackets with a length to height ratio greater than 1,5, the span point is to be taken to the effective bracket: see item c) of Fig 9; otherwise the span point is to be taken to the fitted bracket: see item d) of Fig 9
- for curved brackets, for span positions above the tangent point between fitted bracket and effective bracket, the span point is to be taken to the fitted bracket; otherwise, the span point is to be taken to the effective bracket.

For arrangements where the primary supporting member face plate is carried on to the bracket and backing brackets are fitted, the span point need not be taken greater than to the position where the total depth reaches twice the depth of the primary supporting member. Arrangements with small and large backing brackets are shown in items e) and f) of Fig 9.

For arrangements where the height of the primary supporting member is maintained and the face plate width is increased towards the support, the effective bending span  $l_{bdg}$  may be taken to a position where the face plate breadth reaches twice the nominal breadth.

### 1.1.7 Effective shear span of primary supporting members

The effective shear span  $l_{shr}$  of a primary supporting member may be reduced and taken between the toes of the effective brackets at ends of the primary supporting member, where these toes are as shown in Fig 10. The effective brackets used to define the toe points are defined in [1.1.8].

For arrangements where the effective backing bracket is larger than the effective bracket in way of the PSM face plate, the shear span is to be taken as the mean distance between toes of the effective brackets as shown in item f) of Fig 10.

### 1.1.8 Effective bracket

The effective bracket is defined as the maximum size of the right-angled triangular bracket with a length to height ratio of 1,5 that fits inside the fitted bracket. See Fig 9 and Fig 10 for examples.

Figure 9 : Effective bending span  $l_{bdg}$  of primary supporting members

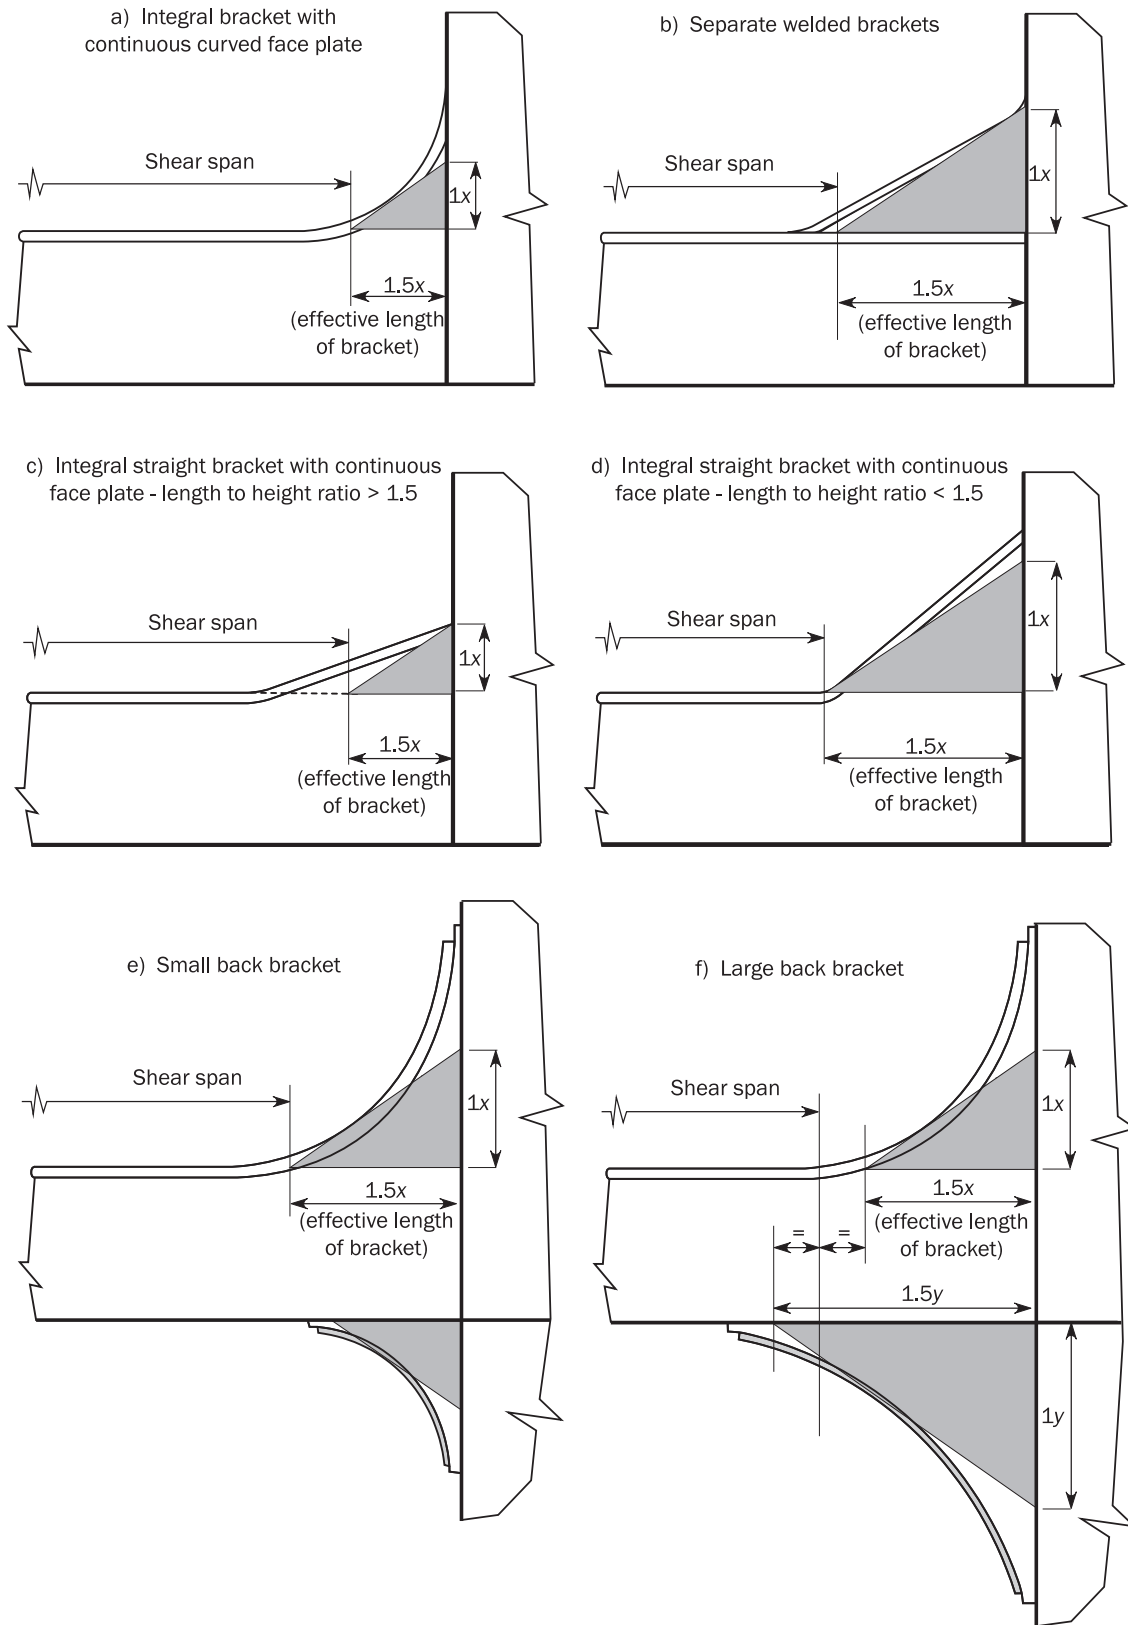

Figure 10 : Effective shear span  $l_{shr}$  of primary supporting members

## 1.2 Spacing and load supporting breadth

### 1.2.1 Stiffeners

Stiffener spacing  $s$ , in mm, for calculation of the effective breadth of the attached plating for stiffeners, is to be taken as the mean spacing between stiffeners at ends (see Fig 11):

$$s = \frac{b_1 + b_2 + b_3 + b_4}{4}$$

where:

$b_1, b_2, b_3, b_4$  : Spacings between stiffeners at ends, in mm.

Figure 11 : Spacing of plating

### 1.2.2 Primary supporting member

Primary supporting member spacing  $S$ , in m, for calculation of the effective breadth of the attached plating for primary supporting members, is to be taken as the mean spacing between adjacent primary supporting members at ends (see Fig 11):

$$S = \frac{b_1 + b_2 + b_3 + b_4}{4}$$

where:

$b_1, b_2, b_3, b_4$  : Spacings between primary supporting members at ends, in m.

### 1.2.3 Spacing of curved plating

For curved plating, the stiffener spacing  $s$  or the primary supporting member spacing  $S$  is to be measured on the mean chord between stiffeners or between primary supporting members, respectively.

## 1.3 Effective breadth

### 1.3.1 Stiffeners

#### a) Yielding check

The effective breadth  $b_{eff}$ , in mm, of the attached plating to be considered in the actual net section modulus for the yielding check of a stiffener is to be obtained from the following formulae:

- where the plating extends on both sides of the stiffener:  
 $b_{eff} = \min(200 \ell ; s)$
- where the plating extends on one side of the stiffener (i.e. stiffener bounding an opening):  
 $b_{eff} = \min(100 \ell ; 0,5 s)$

However, where the attached plate net thickness is less than 8 mm, the effective breadth is not to be taken greater than 600 mm.

b) Buckling check

The effective breadth  $b_{eff}$  of the attached plating to be considered for the buckling check of stiffeners is given in Ch 9, Sec 1.

**1.3.2 Primary supporting members**

The effective breadth  $b_{eff}$ , in m, of the attached plating for calculation of the section modulus and/or moment of inertia of a primary supporting member is to be taken as:

- for  $\frac{\ell_{bdg}}{S\sqrt{3}} \geq 1$ :  $b_{eff} = S \cdot \min \left[ \frac{1,12}{1 + \frac{1,75}{\frac{\ell_{bdg}}{S\sqrt{3}}^{1,6}}}; 1,0 \right]$
- for  $\frac{\ell_{bdg}}{S\sqrt{3}} < 1$ :  $b_{eff} = 0,407 \frac{\ell_{bdg}}{\sqrt{3}}$

**1.3.3 Effective area of curved face plate and curved attached plating of primary supporting members**

The effective net area is applicable to primary supporting members for the following calculations:

- actual net section modulus used for comparison with the scantling requirements in Ch 7, Sec 6
- actual effective net area of curved face plates, modeled by beam elements, used in Part B, Chapter 8.

The following effective net area  $A_{eff-n50}$ , in mm<sup>2</sup>, is only applicable to curved face plates and curved attached plating of primary supporting members and is not applicable for the area of web stiffeners parallel to the face plate.

a) for curved face plates supported by radial brackets or attached plating supported by cylindrical stiffeners:

$$A_{eff-n50} = \left( \frac{3r_f t_{f-n50} + C_f s_r^2}{3r_f t_{f-n50} + s_r^2} \right) t_{f-n50} b_f$$

b) for other curved face plates and curved attached platings:  $A_{eff-n50} = C_f t_{f-n50} b_f$

where:

$C_f$  : Flange efficiency coefficient to be obtained from the following formula but not to be greater than 1,0:

- for symmetrical face plate

$$C_f = C_{f1} \frac{1,285}{\beta k_1}$$

- for unsymmetrical face plate

$$C_f = 0,18 + \frac{0,08}{\beta^2}$$

- for attached plating of box girders

$$C_f = C_{f1} \frac{1,285}{\beta}$$

$C_{f1}$  : Coefficient taken equal to:

- for symmetrical face plates:

$$C_{f1} = \frac{(\sinh k_1 \beta \cosh k_1 \beta + \sin k_1 \beta \cos k_1 \beta)}{(\cosh k_1 \beta)^2 + (\cos k_1 \beta)^2}$$

- for attached plating of box girders with two webs:

$$C_{f1} = \frac{0,78 (\sinh \beta + \sin \beta) (\cosh \beta - \cos \beta)}{(\sinh \beta)^2 + \sin^2 \beta}$$

- for attached plating of box girders with multiple webs:

$$C_{f1} = \frac{1,56 (\cosh \beta - \cos \beta)}{\sinh \beta + \sin \beta}$$

$k_1$  : Coefficient calculated as:

$$k_1 = 1,4 + 1,25 (1,4 - \beta)^3 \quad \text{for} \quad \beta < 1,4$$

$$k_1 = 1,4 \quad \text{for} \quad \beta \geq 1,4$$

$\beta$  : Coefficient, in rad, taken equal to:

$$\beta = \frac{1,285 b_1}{\sqrt{r_f t_{f-n50}}}$$

- $b_1$  : Breadth, in mm, to be taken equal to:
- for symmetrical face plates:  $b_1 = 0,5 (b_f - t_{w-n50})$
  - for unsymmetrical face plates:  $b_1 = b_f$
  - for attached plating of box girders:  $b_1 = s_w - t_{w-n50}$
- $s_w$  : Spacing of supporting webs for box girders, in mm
- $t_{f-n50}$  : Net flange thickness, in mm. For calculation of  $C_f$  and  $\beta$  of unsymmetrical face plates,  $t_{f-n50}$  is not to be taken greater than  $t_{w-n50}$
- $t_{w-n50}$  : Net web plate thickness, in mm
- $r_f$  : Radius, in mm, of face plate or attached plating at mid thickness, see Fig 12
- $b_f$  : Breadth, in mm, of face plate or attached plating, see Fig 12
- $s_r$  : Spacing, in mm, of tripping brackets or web stiffeners or stiffeners normal to the web plating, see Fig 12.

**Figure 12 : Curved shell panel and face plate**

## 1.4 Geometrical properties of stiffeners and primary supporting members

### 1.4.1 Steel stiffener profile with a bulb section

The properties of bulb sections are to be determined considering the actual stiffener profile.

Where such calculation of properties is not possible, a bulb section equivalent to a built-up section is to be taken for steel stiffeners with a bulb section. The net dimensions of the equivalent built-up section are to be obtained, in mm, from the following formulae (see Fig 13):

$$h_w = h'_w - \frac{h'_w}{9,2} + 2$$

$$b_f = \alpha \left( t'_w + \frac{h'_w}{6,7} - 2 \right)$$

$$t_f = \frac{h'_w}{9,2} - 2$$

$$t_w = t'_w$$

where:

$h'_w, t'_w$  : Net height and thickness of a bulb section, in mm, as shown in Fig 13

$\alpha$  : Coefficient equal to:

- for  $h'_w \leq 120$ :

$$\alpha = 1,1 + \frac{(120 - h'_w)^2}{3000}$$

- for  $h'_w > 120$ :

$$\alpha = 1,0$$

Figure 13 : Bulb section and its equivalent built-up section

**1.4.2 Aluminium stiffener profile with a bulb section**

For aluminium stiffeners, the equivalent built-up section as defined in [1.4.1] is not applicable and the properties of bulb sections are to be determined considering the actual stiffener profile.

**1.4.3 Net elastic shear area of stiffeners**

The net elastic shear area  $A_{shr}$ , in  $cm^2$ , of stiffeners is to be taken as:

$$A_{shr} = d_{shr} t_w 10^{-2}$$

where:

- $d_{shr}$  : Effective shear depth of stiffener, in mm, as defined in [1.4.4]
- $t_w$  : Net web thickness of the stiffener, in mm, as defined in Ch 4, Sec 2, Fig 2.

**1.4.4 Effective shear depth of stiffeners**

The effective shear depth of stiffeners  $d_{shr}$ , in mm, is to be taken as:

$$d_{shr} = (h_{stf} - 0,5 t_{c-stf} + t_p + 0,5 t_{c-pl}) \sin \phi_w$$

where:

- $h_{stf}$  : Height of stiffener, in mm, as defined in Ch 4, Sec 2, Fig 2
- $t_p$  : Net thickness of the stiffener attached plating, in mm, as defined in Ch 4, Sec 2, Fig 2
- $t_{c-stf}$  : Corrosion addition, in mm, of the considered stiffener as given in Ch 4, Sec 3
- $t_{c-pl}$  : Corrosion addition, in mm, of the attached plate to the considered stiffener as given in Ch 4, Sec 3.

**1.4.5 Elastic net section modulus of stiffeners**

The elastic net section modulus  $Z$  of stiffeners, in  $cm^3$ , is to be taken as:

$$Z = Z_{stf} \sin \phi_w$$

where:

- $Z_{stf}$  : Net section modulus of the stiffener, in  $cm^3$ , considered perpendicular to its attached plate, i.e. with  $\phi_w = 90^\circ$

**1.4.6 Net moment of inertia of stiffeners**

The net moment of inertia  $I$  of stiffeners, in  $cm^4$ , is to be taken as:

$$I = I_{stf} \sin^2 \phi_w$$

where:

- $I_{stf}$  : Net moment of inertia of the stiffener, in  $cm^4$ , considered perpendicular to its attached plate, i.e. with  $\phi_w = 90^\circ$

**1.4.7 Effective net plastic shear area of stiffeners**

The net plastic shear area  $A_{shr-pl}$  of stiffeners, in  $cm^2$ , which is used for assessment against impact loads is to be taken as:

$$A_{shr-pl} = A_{shr}$$

where:

- $A_{shr}$  : Net elastic shear area, in  $cm^2$ , as defined in [1.4.3].

**1.4.8 Effective net plastic section modulus of stiffeners**

The effective net plastic section modulus  $Z_{pl}$  of stiffeners, in  $\text{cm}^3$ , is given by the formula in item a) or item b), depending on:

- the cross-sectional area of the attached plate  $A_p$
- the net cross-sectional area of the ordinary stiffener:  $A_w' + A_f$

where:

$A_p$  : Net cross-sectional area of the attached plate, in  $\text{cm}^2$ , taken equal to:

$$A_p = \frac{s t_p}{100}$$

$A_f$  : Net cross-sectional area of the stiffener flange, in  $\text{cm}^2$ , taken equal to:

$$A_f = \frac{b_f t_f}{100}$$

$A_w'$  : Net cross-sectional area of the stiffener web, in  $\text{cm}^2$ , taken equal to:

$$A_w' = \frac{h_w t_w}{100}$$

a) When  $A_p \geq A_w' + A_f$ , the plastic neutral axis PNA is assumed to be tangent to the edge of the attached plate closest to the stiffener.

$$Z_{pl} = \frac{A_p' x_p + A_w' x_w + A_f x_f}{10}$$

where:

$A_p'$  : Net cross-sectional area of the stiffener, in  $\text{cm}^2$ , taken equal to:

$$A_p' = A_w' + A_f$$

$x_p$  : Distance, in mm, between the centre of gravity of area  $A_p$  and PNA, taken equal to:

$$x_p = \text{Min} \left( 100 \frac{A_w' + A_f}{2 s} ; \frac{t_p}{2} \right)$$

$x_w$  : Distance, in mm, between the centre of gravity of area  $A_w'$  and PNA, taken equal to:

$$x_w = \frac{h_w \sin \varphi_w}{2}$$

$x_f$  : Distance, in mm, between the centre of gravity of area  $A_f$  and PNA, taken equal to:

$$x_f = h_{fc} \sin \varphi_w - b_w \cos \varphi_w$$

$h_{fc}$  : Height, in mm, of the stiffener, measured up to the centre of the flange area, see Fig 14

$b_w$  : Distance, in mm, from the mid-thickness plane of the stiffener web to the centre of the flange area, see Fig 14.

**Figure 14 : Dimensions of a built section**

b) When  $A_p < A_w' + A_f$  the plastic neutral axis PNA is located at a distance  $z_a$  above the attached plate, in mm, given by:

$$z_a = \frac{(100 A_f + h_w t_w - t_p s) \sin \varphi_w}{2 t_w}$$

$$Z_{pl} = \frac{(A_p x_p + A_{wa} x_{wa} + A_{wb} x_{wb} + A_f x_f)}{10}$$

where:

$x_p$  : Distance, in mm, between the centre of gravity of area  $A_p$  and PNA, taken equal to:

$$x_p = z_a + \frac{t_p}{2}$$

$A_{wa}$  : Net cross-sectional area, in  $\text{cm}^2$ , of the part of the stiffener located above PNA, taken equal to:

$$A_{wa} = \left( h_w - \frac{z_a}{\sin \phi_w} \right) \frac{t_w}{100}$$

$x_{wa}$  : Distance, in mm, between the centre of gravity of area  $A_{wa}$  and PNA, taken equal to:

$$x_{wa} = \left( h_w - \frac{z_a}{\sin \phi_w} \right) \frac{\sin \phi_w}{2}$$

$A_{wb}$  : Net cross-sectional area, in  $\text{cm}^2$ , of the part of ordinary stiffener located below the PNA, taken equal to:

$$A_{wb} = \frac{t_w z_a}{100 \sin \phi_w}$$

$x_{wb}$  : Distance, in mm, between the centre of gravity of area  $A_{wb}$  and PNA, taken equal to:

$$x_{wb} = \frac{z_a}{2}$$

$x_f$  : Distance, in mm, between the centre of gravity of area  $A_f$  and PNA, taken equal to:

$$x_f = h_{fc} \sin \phi_w - b_w \cos \phi_w - z_a$$

**1.4.9 Primary supporting member web not perpendicular to attached plating**

Where the web of a primary supporting member is not perpendicular to the attached plating, the actual net shear area  $A_{sh-n50}$ , in  $\text{cm}^2$ , and the actual net section modulus  $Z_{n50}$ , in  $\text{cm}^3$ , may be obtained from the following formulae:

- actual net shear area:  $A_{sh-n50} = A_{sh-0-n50} \sin \phi_w$
- actual net section modulus:  $Z_{n50} = Z_{perp-n50} \sin \phi_w$

where:

$A_{sh-0-n50}$  : Actual net shear area, in  $\text{cm}^2$ , of the primary supporting member assumed to be perpendicular to the attached plating, to be taken equal to:  $A_{sh-0-n50} = (h_{eff} + t_{f-n50} + t_{p-n50}) t_{w-n50} \cdot 10^{-2}$

$Z_{perp-n50}$  : Actual section modulus, in  $\text{cm}^3$ , with attached plating, of the primary supporting member assumed to be perpendicular to the attached plating.

**Figure 15 : Dimensions  $h_{w1}$ ,  $h_{w2}$ ,  $h_{w3}$  and  $h_{w4}$  in way of web openings**

**1.4.10 Shear area of primary supporting members with web openings**

The effective web height  $h_{eff}$ , in mm, to be considered for the calculation of the effective net shear area  $A_{sh-n50}$  is to be taken as the lesser of:

$$h_{eff} = h_w$$

$$h_{eff} = h_{w3} + h_{w4}$$

$$h_{eff} = h_{w1} + h_{w2} + h_{w4}$$

calculated at a distance 'a' less than  $h_w/3$  on each side of the considered cross-section,

where:

$h_w$  : Web height of the primary supporting member, in mm

$h_{w1}, h_{w2}, h_{w3}, h_{w4}$  : Dimensions, in mm, as shown in Fig 15.

**1.4.11 Stiffener flange width**

In case the stiffener flange thickness requirement in NR615, Sec 2, [4.1.1] item b) is not fulfilled, the effective free flange outstand, used in strength assessment including the calculation of actual net section modulus, is to be taken as  $b_{f-out-max}$  defined in NR615, Sec 2, [4.1.1].

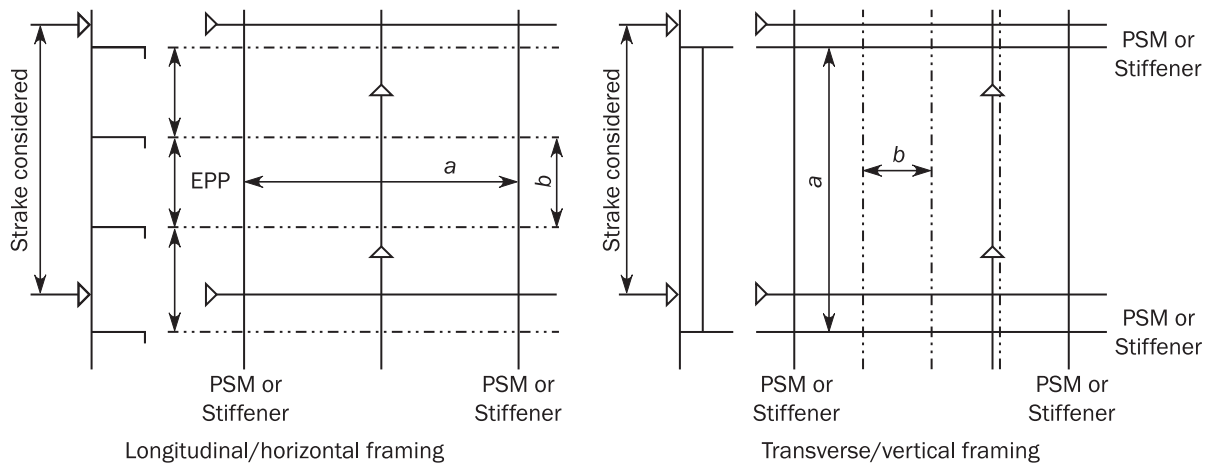

**2 Plates**

**2.1 Idealisation of EPP**

**2.1.1 EPP**

An Elementary Plate Panel (EPP) is the unstiffened part of the plating between stiffeners and/or primary supporting members. The plate panel length,  $a$ , and breadth,  $b$ , of the EPP are defined respectively as the longer and the shorter plate edges, as shown in Fig 16.

**Figure 16 : Elementary Plate Panel (EPP) definition**

**2.1.2 Strake required thickness**

The required thickness of a strake is to be taken as the greatest value required for each EPP within that strake. The requirements given in Tab 1 are to be applied for the selection of strakes to be considered, as shown in Fig 17, where:

$a_1$  : Distance, in mm, measured inside the considered strake in the direction of the long edge of the EPP, between the strake boundary weld seam and the EPP edge.

The maximum corrosion addition within a strake is to be applied according to Ch 4, Sec 3, [1.2.5].

**2.1.3** For direct strength assessment, the EPP is idealised with the mesh arrangement in the finite element model.

**2.2 Load Calculation Point**

**2.2.1 Yielding**

For the yielding check, the local pressure and the hull girder stress, used for the calculation of the local scantling requirements, are to be taken at the LCP (Load Calculation Point) having coordinates  $x$ ,  $y$  and  $z$  as defined in Tab 2.

**2.2.2 Ultimate buckling capacity**

The load calculation points of the stiffener attached plating, to be considered for the stiffener ultimate buckling capacity check according to NR615, Sec 5, [2.3.4], are defined in Ch 4, Sec 6, [2].

**2.2.3 Buckling**

For the prescriptive buckling check of the EPP according to Ch 9, Sec 1, the LCP for the pressure and for the hull girder stresses are defined in Tab 3.

For the finite element buckling check, Ch 9, Sec 1 is applicable.

**Figure 17 : Strake considered in a given EPP**

**Table 1 : Strake considered in a given EPP**

	$a/b > 2$	$a/b \leq 2$
$a_1 > b/2$	All strakes (St1, St2, St3, St4)	All strakes (St1, St2, St3, St4)
$a_1 \leq b/2$	Strakes St2 and St4	All strakes (St1, St2, St3, St4)

**Table 2 : LCP coordinates for yielding**

LCP coordinates	General (1)		Horizontal plating		Vertical transverse structure and transverse stool plating	
	Longitudinal framing ( Fig 18)	Transverse framing ( Fig 19)	Longitudinal framing	Transverse framing	Horizontal framing ( Fig 20)	Vertical framing ( Fig 21)
x coordinate	Mid-length of the EPP		Mid-length of the EPP		Corresponding to y and z coordinates	
y coordinate	Corresponding to x and z coordinates		Outboard y coordinate of the EPP		Outboard y coordinate of the EPP, taken at z level (2)	
z coordinate	EPP lower edge	The greater of the EPP lower edge or strake lower edge (3)	Corresponding to x and y coordinates		EPP lower edge	The greater of the EPP lower edge or strake lower edge (3)

- (1) All structures other than horizontal platings or vertical transverse structures.  
 (2) For transom plate, the y coordinate of the load calculation point is to be taken corresponding to the y value at side shell at z level of the load calculation point, for the external dynamic pressure calculation.  
 (3) For plating subject to sloshing loads, the LCP z coordinate is to be taken as the one associated to the maximum lateral pressure among the following:
- EPP upper edge
  - The point corresponding to the tank filling level (if applicable)
  - The greater of the EPP lower edge or strake lower edge.

**Table 3 : LCP coordinates for plate buckling**

LCP coordinates	LCP for pressure	LCP for hull girder stresses ( Fig 22)		
		Bending stresses (1)		Shear stresses
		Non horizontal plate	Horizontal plate	
x coordinate	Same coordinates as LCP for yielding. See Tab 2	Mid-length of the EPP		
y coordinate		Corresponding to x and z coordinates	Outboard and inboard ends of the EPP (points A1 and A2)	Mid-point of EPP (point B)
z coordinate		Both upper and lower ends of the EPP (points A1 and A2)	Corresponding to x and y coordinates	

(1) The bending stress for curved plate panel is the mean value of the stresses calculated at points A1 and A2.

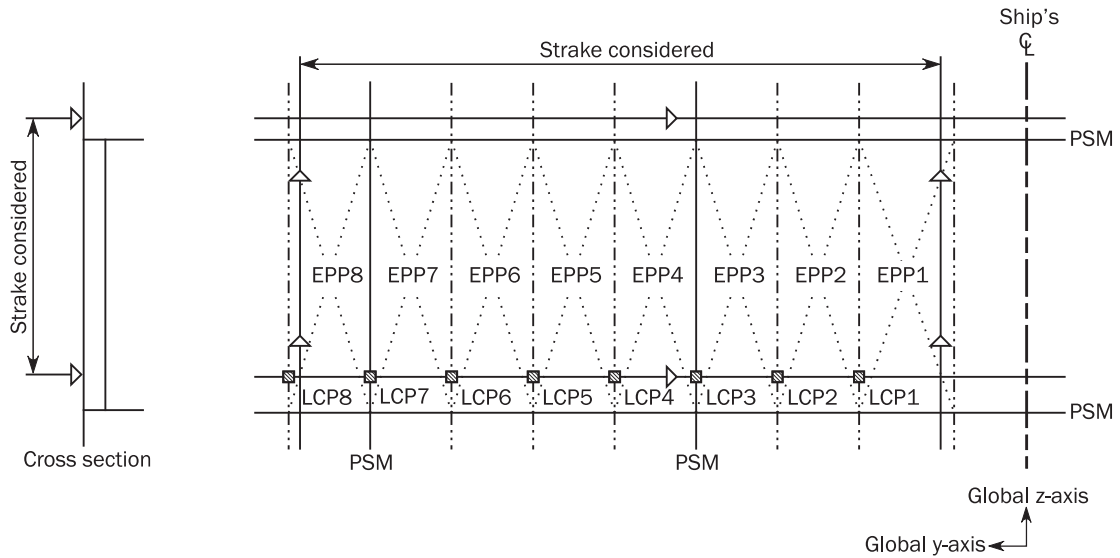

Figure 22 : Load calculation point for plate buckling – Hull girder stresses

### 3 Stiffeners

#### 3.1 Reference point

3.1.1 The requirements of stiffener section modulus relate to the reference point giving the minimum section modulus. This reference point is located as shown in Fig 23 for typical profiles.

#### 3.2 Load calculation point

##### 3.2.1 LCP for pressure

The load calculation point for the pressure is located at the:

- middle of the full length  $\ell$  of the considered stiffener
- intersection point between the stiffener and its attached plate.

For stiffeners located on transom plate, the y coordinate of the load calculation point is to be taken corresponding to the y value at side shell at z level of the load calculation point, for the external dynamic pressure calculation.

##### 3.2.2 LCP for hull girder bending stress

The load calculation point for the hull girder bending stress is defined as follows:

- for prescriptive yielding verification according Ch 7, Sec 5 and Ch 11, Sec 4:
  - at the middle of the full length  $\ell$  of the considered stiffener
  - at the reference point given in Fig 23.

- for prescriptive buckling requirements according to Ch 9, Sec 1:
  - at the middle of the full length  $\ell$  of the considered stiffener
  - at the intersection point between the stiffener and its attached plate.

**3.2.3 Non-horizontal stiffeners**

The lateral pressure  $P$ , in  $\text{kN/m}^2$ , is to be calculated as the maximum between the value obtained at the middle of the full length  $\ell$  and the value obtained from the following formulae:

- when the upper end of the vertical stiffener is below the lowest zero pressure level:

$$P = \frac{P_U + P_L}{2}$$

- when the upper end of the vertical stiffener is at or above the lowest zero pressure level (see Fig 24):

$$P = \frac{\ell_1}{\ell} \frac{P_L}{2}$$

where:

- $\ell_1$  : Distance, in m, between the lower end of vertical stiffener and the lowest zero pressure level
- $P_U, P_L$  : Lateral pressures, in  $\text{kN/m}^2$ , at the upper and lower ends of the vertical stiffener span  $\ell$ , respectively.

**Figure 23 : Reference point for calculation of section modulus and hull girder stress for local scantling assessment**

**Figure 24 : Definition of pressure for non-horizontal stiffeners**

**4 Primary supporting members**

**4.1 Load calculation point**

**4.1.1** The load calculation point is located at the middle of the full length  $\ell$ , at the attachment point of the primary supporting member with its attached plate.

For primary supporting members located on transom plate, the  $y$  coordinate of the load calculation point is to be taken corresponding to  $y$  value at side shell at  $z$  level of load calculation point for the external dynamic pressure calculation.

# Section 1 Introduction

## Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

## 1 General

### 1.1 Definition

#### 1.1.1 Scope

This Chapter provides the design loads for strength and fatigue assessments.

The load combinations are to be derived for the design load scenarios specified in Ch 5, Sec 7. This Section uses the concept of design load scenarios to specify consistent design load sets which cover relevant operating modes.

#### 1.1.2 Equivalent Design Wave (EDW)

The dynamic loads associated to each dynamic load case are based on the Equivalent Design Wave (EDW) concept. The EDW concept applies a consistent set of dynamic loads to the ship such that a specified dominant load response is equivalent to the required long term response value.

#### 1.1.3 Probability levels for strength and fatigue assessments

In this Chapter, the assessments are to be understood as follows:

- Strength assessment means the assessment for strength criteria, excluding fatigue, for seagoing conditions, ballast water exchange conditions, harbour conditions and flooded conditions, based on loads corresponding to a return period of 25 years (probability level approximately of  $10^{-8}$ )
- Fatigue assessment means the assessment for fatigue criteria based on loads corresponding to the probability level of  $10^{-2}$ .

#### 1.1.4 Loads for strength assessment

The strength assessment is to be undertaken for all design load scenarios. The final assessment is to be made on the most demanding strength requirement.

Each design load scenario for strength assessment is composed of a static load case or a static + dynamic load case, where the static and dynamic loads depend on the loading condition being considered.

The static loads are defined in the following Sections:

- still water hull girder loads in Ch 5, Sec 4
- environmental loads in Ch 5, Sec 5
- internal and cargo loads in Ch 5, Sec 6.

The EDWs for the strength assessment and the dynamic load combination factors for global loads are listed in Ch 5, Sec 2, [2].

The dynamic loads are defined in the following Sections:

- dynamic hull girder loads in Ch 5, Sec 4
- environmental loads in Ch 5, Sec 5
- internal and cargo loads in Ch 5, Sec 6.

#### 1.1.5 Loads for fatigue assessment

Each design load scenario for fatigue assessment is composed of a static + dynamic load case, where the static and dynamic loads depend on the loading condition being considered.

The static loads are defined in the following Sections:

- still water hull girder loads in Ch 5, Sec 4
- environmental loads in Ch 5, Sec 5
- internal and cargo loads in Ch 5, Sec 6.

The EDWs for the fatigue assessment and the dynamic load combination factors for global loads are listed in Ch 5, Sec 2, [3].

The dynamic loads are defined in the following Sections:

- dynamic hull girder loads in Ch 5, Sec 4
- environmental loads in Ch 5, Sec 5
- internal and cargo loads in Ch 5, Sec 6.

## 1.2 Sign convention

### 1.2.1 Sign convention for ship motions

The ship motions are defined with respect to the ship's centre of gravity (COG) as shown in Fig 1, where:

- positive surge is translation in the X-axis direction (positive forward)
- positive sway is translation in the Y-axis direction (positive towards portside of ship)
- positive heave is translation in the Z-axis direction (positive upwards)
- positive roll motion is positive rotation about a longitudinal axis through the COG (starboard down and portside up)
- positive pitch motion is positive rotation about a transverse axis through the COG (bow down and stern up)
- positive yaw motion is positive rotation about a vertical axis through the COG (bow moving to portside and stern to starboard).

Figure 1 : Definition of positive motions

### 1.2.2 Sign conventions for hull girder loads

The sign conventions of vertical and horizontal bending moments, and vertical and horizontal shear forces, at any ship transverse section, are as shown in Fig 2, namely the:

- vertical shear forces  $Q_{sw}$  and  $Q_{wv}$  are positive in the case of downward resulting forces acting aft of the transverse section and upward resulting forces acting forward of the transverse section under consideration
- vertical bending moments  $M_{sw}$  and  $M_{wv}$  are positive when they induce tensile stresses in the strength deck (hogging bending moment) and negative when they induce tensile stresses in the bottom (sagging bending moment)
- horizontal bending moment  $M_{wh}$  is positive when it induces tensile stresses in the starboard side and negative when it induces tensile stresses in the portside
- torsional moment  $M_{wt}$  is positive in the case of resulting moment acting aft of the transverse section following negative rotation around the X-axis, and of resulting moment acting forward of the transverse section following positive rotation around the X-axis
- horizontal shear force  $Q_{wh}$  is positive in the case of resulting forces acting toward starboard side aft of the transverse section and resulting force acting toward portside forward of the transverse section under consideration.

Figure 2 : Sign conventions for shear forces  $Q_{sw}$ ,  $Q_{wv}$  and  $Q_{wh}$  and bending moments  $M_{sw}$ ,  $M_{wv}$ ,  $M_{wh}$  and  $M_{wt}$

# Section 2 Dynamic Load Cases

## Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

$a_{\text{surge}}$ ,  $a_{\text{sway}}$ ,  $a_{\text{heave}}$ ,  $a_{\text{roll}}$ ,  $a_{\text{pitch}}$ ,  $a_{\text{yaw}}$ : Acceleration components, as defined in Ch 5, Sec 3

$a_{\text{roll-y}}$ ,  $a_{\text{roll-z}}$ ,  $a_{\text{pitch-x}}$ ,  $a_{\text{pitch-z}}$ ,  $a_{\text{yaw-x}}$ ,  $a_{\text{yaw-y}}$ : Acceleration components, as defined in Ch 5, Sec 3

$f_{\text{TL}}$ : Ratio between draught at the considered loading condition and rule length, to be taken as:

$$f_{\text{TL}} = T_{\text{LC}} / L$$

$f_{\text{lp}}$ : Factor depending on the longitudinal position along the ship, to be taken as follows:

- $f_{\text{lp}} = 1,0$  for  $x \leq 0,4 L$
- $f_{\text{lp}} = -1,0$  for  $x \geq 0,6 L$

Intermediate values of  $f_{\text{lp}}$  are to be obtained by linear interpolation

Load combination factors, to be applied to the:

$C_{\text{WV}}$ : Vertical wave bending moment

$C_{\text{QV}}$ : Vertical wave shear force

$C_{\text{WT}}$ : Wave torsional moment

$C_{\text{WH}}$ : Horizontal wave bending moment

$C_{\text{QH}}$ : Horizontal wave shear force

$C_{\text{XS}}$ : Surge acceleration

$C_{\text{XP}}$ : Longitudinal acceleration due to pitch

$C_{\text{XY}}$ : Longitudinal acceleration due to yaw

$C_{\text{XG}}$ : Gravitational acceleration due to pitch

$C_{\text{YS}}$ : Sway acceleration

$C_{\text{YR}}$ : Transverse acceleration due to roll

$C_{\text{YY}}$ : Transverse acceleration due to yaw

$C_{\text{YG}}$ : Gravitational acceleration due to roll

$C_{\text{ZH}}$ : Heave acceleration

$C_{\text{ZR}}$ : Vertical acceleration due to roll

$C_{\text{ZP}}$ : Vertical acceleration due to pitch

$C_{\text{B-LC}}$ : Block coefficient at considered loading condition draught  $T_{\text{LC}}$  as defined in Ch 1, Sec 3, [2.1.9]. For flooded loading conditions, the value of  $C_{\text{B-LC}}$  is to be taken as for the full load condition unless provided in the loading manual

$C_{\text{W-LC}}$ : Waterplane coefficient at considered loading condition draught  $T_{\text{LC}}$  as defined in Ch 1, Sec 3, [2.1.10]. For flooded loading conditions, the value of  $C_{\text{W-LC}}$  is to be taken as for the full load condition unless provided in the loading manual

$T_{\text{R}}$ : Dimensionless roll period, to be taken as:

$$T_{\text{R}} = T_{\theta} (g / L)^{0,5}$$

without being taken greater than  $75/L^{0,5}$

$\omega_{\text{R}}$ : Roll angular frequency, in rad/s, to be taken as:

$$\omega_{\text{R}} = 2\pi / T_{\theta}$$

## 1 General

### 1.1 Definition of EDW and dynamic load cases

1.1.1 The Equivalent Design Waves (EDW) and the dynamic load cases to be used for structural assessment are defined in Tab 1.

### 1.2 Application

#### 1.2.1 General load cases

The dynamic load cases described in [1.3] are to be applied for the structural assessments that do not require complete ship modeling i.e.:

- a) strength assessment:
  - for plating, ordinary stiffeners and primary supporting members by prescriptive methods
  - for the direct strength method (FE analysis) assessment of structural members, based on partial ship models
- b) fatigue assessment:
  - for structural details covered by simplified stress analysis
  - for structural details covered by FE stress analysis bases on partial ship models.

These dynamic load cases are to be used for design load scenarios described in Ch 5, Sec 7.

**1.2.2 Load cases for structural analyses based on complete ship models**

When primary supporting members are to be analysed through complete ship models, according to Ch 7, Sec 6, [1.1.2], specific load cases are to be considered.

These load cases are to be defined considering the ship as sailing in regular waves with different length, height and heading angle, each wave being selected in order to maximise a design load parameter. The procedure for the determination of these load cases is specified in Ch 8, App 3, [3] and Ch 8, App 3, [4].

**1.3 Description of dynamic load cases**

**1.3.1** Tab 2 to Tab 7 describe the ship motion responses and the global loads corresponding to each dynamic load case to be considered for the strength and fatigue assessments.

**Table 1 : Definition of Equivalent Design Waves (EDW) and dynamic load cases**

EDW	Load case	Definition
HVM	HVM1	Head sea with maximum negative vertical bending moment (sagging) amidships (3)
	HVM2	Head sea with maximum positive vertical bending moment (hogging) amidships (3)
HVMf (1)	HVMf1	Head sea with maximum negative vertical bending moment (sagging) at 0,25 L from AE (3)
	HVMf2	Head sea with maximum positive vertical bending moment (hogging) at 0,25 L from AE (3)
FVM (2)	FVM1	Following sea with maximum negative vertical bending moment (sagging) at 0,25 L from AE (3)
	FVM2	Following sea with maximum positive vertical bending moment (hogging) at 0,25 L from AE (3)
BR	BR1-P	Beam sea with maximum negative roll motion
	BR2-P	Beam sea with maximum positive roll motion
	BR1-S	Beam sea with maximum positive roll motion
	BR2-S	Beam sea with maximum negative roll motion
BP	BP1-P	Beam sea with maximum negative hydrodynamic pressure at the waterline amidships
	BP2-P	Beam sea with maximum positive hydrodynamic pressure at the waterline amidships
	BP1-S	Beam sea with maximum negative hydrodynamic pressure at the waterline amidships
	BP2-S	Beam sea with maximum positive hydrodynamic pressure at the waterline amidships
OHM	OHM1-P	Oblique sea with maximum negative horizontal bending moment amidships
	OHM2-P	Oblique sea with maximum positive horizontal bending moment amidships
	OHM1-S	Oblique sea with maximum positive horizontal bending moment amidships
	OHM2-S	Oblique sea with maximum negative horizontal bending moment amidships
OHS (2)	OHS1-P	Oblique sea with maximum negative horizontal shear force and torsion at 0,75 L from AE
	OHS2-P	Oblique sea with maximum positive horizontal shear force and torsion at 0,75 L from AE
	OHS1-S	Oblique sea with maximum positive horizontal shear force and torsion at 0,75 L from AE
	OHS2-S	Oblique sea with maximum negative horizontal shear force and torsion at 0,75 L from AE

- (1) Applicable to fatigue assessment only.
- (2) Applicable to strength assessment only.
- (3) The vertical shear force is also maximised with the dominant load component

**Note 1:** 1 and 2 denote the maximum positive or negative value of the dominant load component for each load case.

**Note 2:** P and S denote that the weather side (side of the ship exposed to the incoming waves) is on portside and on starboard side, respectively. The lee side (sheltered side of the ship away from the incoming waves) is on the opposite side.

EDW	Load case	Definition
OVA (2)	OVA1-P	Oblique sea with maximum negative vertical acceleration at L from AE
	OVA2-P	Oblique sea with maximum positive vertical acceleration at L from AE
	OVA1-S	Oblique sea with maximum negative vertical acceleration at L from AE
	OVA2-S	Oblique sea with maximum positive vertical acceleration at L from AE

(1) Applicable to fatigue assessment only.  
 (2) Applicable to strength assessment only.  
 (3) The vertical shear force is also maximised with the dominant load component

**Note 1:** 1 and 2 denote the maximum positive or negative value of the dominant load component for each load case.  
**Note 2:** P and S denote that the weather side (side of the ship exposed to the incoming waves) is on portside and on starboard side, respectively. The lee side (sheltered side of the ship away from the incoming waves) is on the opposite side.

## 2 Dynamic load cases for strength assessment

### 2.1 Selection of EDW

2.1.1 The following Equivalent Design Waves are to be considered for the strength assessment:

- HVM
- FVM
- BR
- BP
- OHM
- OHS
- OVA

### 2.2 Load combination factors

2.2.1 The load combinations factors LCFs for the determination of each load component to be used for strength assessment are defined in Tab 8 to Tab 13.

**Table 8 : Load combination factors LCFs for HVM and FVM load cases - Strength assessment**

Load component	LCF	HVM1	HVM2	FVM1	FVM2	
Hull girder loads	$M_{wv}$	$C_{wv}$	-1	1	-1	1
	$Q_{wv}$	$C_{qv}$	$-f_{ip}$	$f_{ip}$	$-f_{ip}$	$f_{ip}$
	$M_{wh}$	$C_{wh}$	0	0	0	0
	$Q_{wh}$	$C_{qh}$	0	0	0	0

### 3 Dynamic load cases for fatigue assessment

#### 3.1 Selection of EDW

3.1.1 The following Equivalent Design Waves are to be considered for the fatigue assessment:

- HVM
- HVMf
- BR
- BP
- OHM

#### 3.2 Load combination factors

3.2.1 The load combinations factors LCFs for the determination of each load component to be used for fatigue assessment are defined in Tab 14 to Tab 17.

**Table 14 : Load combination factors LCFs for HVM and HVMf load cases - Fatigue assessment**

Load component		LCF	HVM1	HVM2	HVMf1	HVMf2
Hull girder loads	$M_{wv}$	$C_{wv}$	- 1	1	- 1	1
	$Q_{wv}$	$C_{Qv}$	- $f_{ip}$	$f_{ip}$	- $f_{ip}$	$f_{ip}$

## Section 3 Ship Motions and Accelerations

### Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

- $\alpha$  : Parameter used for the calculation of  $L_{ref}$  and defined throughout Ch 5, Sec 3, Ch 5, Sec 4 and Ch 5, Sec 5 for the motion, acceleration or load under consideration
- $a_{pitch-x}$  : Longitudinal acceleration due to pitch, in  $m/s^2$ , as defined in [3.2.2]
- $a_{pitch-z}$  : Vertical acceleration due to pitch, in  $m/s^2$ , as defined in [3.2.4]
- $a_{roll-y}$  : Transverse acceleration due to roll, in  $m/s^2$ , as defined in [3.2.3]
- $a_{roll-z}$  : Vertical acceleration due to roll, in  $m/s^2$ , as defined in [3.2.4]
- $A_{WP-LC}$  : Waterplane area at considered loading condition draught  $T_{LC}$ , in  $m^2$
- $a_{yaw-x}$  : Longitudinal acceleration due to yaw, in  $m/s^2$ , as defined in [3.2.2]
- $a_{yaw-y}$  : Transverse acceleration due to yaw, in  $m/s^2$ , as defined in [3.2.3]
- $C_\alpha$  : Parameter defined throughout the Rules for the motion, acceleration or load under consideration
- $C_{B-LC}$  : Block coefficient at considered loading condition draught  $T_{LC}$ , as defined in Ch 1, Sec 3, [2.1.9].  
Specific values may be defined in Tab 4 for typical loading conditions.
- $C_s$  : Parameter defined for the considered load
- $C_{W-LC}$  : Waterplane coefficient at considered loading condition draught  $T_{LC}$ , as defined in Ch 1, Sec 3, [2.1.10].  
Specific values may be defined in Tab 4 for typical loading conditions.
- $C_{XG}, C_{XS}, C_{XP}, C_{XY}, C_{YG}, C_{YS}, C_{YR}, C_{YY}, C_{ZH}, C_{ZR}$  and  $C_{ZP}$ : Load combination factors, as defined in Ch 5, Sec 2
- $F$  : Froude's number at 0,75 V, to be taken as:  $F = 0,123 V / L^{0,5}$
- $F_{5,0}$  : Froude's number at 5 knots, to be taken as:  $F_{5,0} = 0,82 / L^{0,5}$
- $f_\alpha$  : Speed effect coefficient for the reference length, to be taken as, unless otherwise specified:
- for strength assessment:  
 $f_\alpha = 1,0$
  - for fatigue assessment:  
 $f_\alpha = 1,0 + C_\alpha (F - F_{5,0})$
- $f_\beta$  : Heading correction factor to be taken as:
- for the extreme sea and the ballast water exchange design load scenario:
    - for BR and BP:  
 $f_\beta = 0,80$
    - for the other EDWs:  
 $f_\beta = 1,00$
  - for fatigue assessment:  
 $f_\beta = 1,00$
- $f_{BL}$  : Ratio between moulded breadth and rule length, to be taken as:  
 $f_{BL} = B / L$
- $f_{nl}$  : Non-linear factor to be taken as 1,0
- $f_p$  : Coefficient to be taken as, unless otherwise specified:
- for strength assessment:  
 $f_p = f_{ps}$
  - for fatigue assessment:
    - for fatigue due to high-cycle wave loads only:  
 $f_p = 1$
    - for fatigue due to loading/unloading, as applicable according to Ch 10, Sec 1, [1.3]:  
 $f_p = f_{pLU}$

- $f_{pLU}$  : Coefficient for loading/unloading fatigue assessments which depend on the cycle period  $T_{LU}$ , in days, and operational limit  $h_{LU}$ , in m, to be taken as:
- $$f_{pLU} = a_{LU} + b_{LU} \times \ln T_{LU}$$
- where:
- $$a_{LU} = 1,6 - 0,35 e^{-0,2 h_{LU}^2}$$
- $$b_{LU} = 0,25 + \frac{0,23}{\pi} \operatorname{atan}\left(\frac{h_{LU}-7}{2}\right)$$
- $f_{ps}$  : Coefficient for strength assessments which depend on the applicable design load scenario specified in Ch 5, Sec 7, to be taken as:
- for the extreme sea design load scenario:
 
$$f_{ps} = 1,0$$
  - for the ballast water exchange design load scenario:
 
$$f_{ps} = 0,8$$
- $f_R$  : Routing factor to be taken as:
- for strength assessment of ships assigned with the navigation notation **unrestricted navigation** or the operating area notation **unrestricted dredging area**:
 
$$f_R = 0,85$$
  - for strength assessment of ships having a navigation notation other than **unrestricted navigation** or any restricting operating area notation:
 
$$f_R = 1,00$$
  - for fatigue assessment:
 
$$f_R = 1,00$$
- $f_s$  : Speed effect coefficient, to be taken as:
- for strength assessment:
 
$$f_s = 1,0$$
  - for fatigue assessment:
 
$$f_s = 1,0 + C_s (F - F_{5,0})$$
- $f_{TL}$  : Ratio between draught at the considered loading condition and rule length, to be taken as:
- $$f_{TL} = T_{LC} / L$$
- GM : Metacentric height, in m, for the considered loading condition, as defined in [2.1.1]
- H : Wave parameter, in m, as defined in [1.1.1]
- $h_{LU}$  : Reference height for loading/unloading fatigue assessment, in m, associated to the navigation notation, as given in Tab 1.
- $L_c$  : Length, in m, as defined in Tab 1
- $L_{ref}$  : Reference length, in m, to be taken as:
- $$L_{ref} = \min\left[\alpha f_{\alpha} L_c; L\left(\frac{L_c}{40}\right)\right]$$
- $T_{LU}$  : Loading/unloading cycle period, in days, to be submitted by the Designer, not to be taken greater than 15 days nor less than 0,5 days
- x y z : X, Y and Z coordinates, in m, of the considered point with respect to the coordinate system, as defined in Ch 1, Sec 3, [2.6]
- $x_G$  : Longitudinal coordinate, in m, of the ship's centre of gravity, for the considered loading condition, to be taken as:
- $$x_G = 0,57 C_{B-LC}^{0,4} L$$
- $z_G$  : Vertical coordinate, in m, of the ship's centre of gravity, for the considered loading condition, to be taken as:
- $$z_G = 1,08 \left( \frac{T_{LC}}{2} + \frac{B^2}{12 T_{LC}} \right) - GM$$

# 1 General

## 1.1 Definitions

### 1.1.1 Wave parameter

The wave parameter H, in m, is to be taken as:

- for  $L \leq L_{ref}$ :

$$H = f_p A_0 \left[ 1 - A_1 \left( 1 - \sqrt{\frac{L}{L_{ref}}} \right)^{e_1} \right]$$

- for  $L > L_{ref}$ :

$$H = f_p A_0 \left[ 1 - A_2 \left( \sqrt{\frac{L}{L_{ref}}} - 1 \right)^{e_2} \right]$$

where:

$A_0, A_1, A_2, e_1, e_2$ : Coefficients defined in Tab 1 for strength and for fatigue assessment

$L_{ref}$ : Reference length calculated with  $\alpha$  and  $f\alpha$  values as defined for the considered acceleration, motion or load.

Where specific designation of the geographical area and/or the most unfavorable sea conditions considered are added to the navigation notation as per Pt A, Ch 1, Sec 2, [5.2.6], the wave parameter H is to be calculated using **unrestricted navigation** parameters unless a specific value for H has been determined by the Society based on the scatter diagram corresponding to the geographical area or the sea condition considered.

### 1.1.2 Navigation coefficient

For the strength assessment, the navigation coefficient n is to be taken according to Tab 2.

For the fatigue assessment, the navigation coefficient n is to be taken according to Tab 3.

Where specific designation of the geographical area and/or the most unfavorable sea conditions considered are added to the navigation notation as per Pt A, Ch 1, Sec 2, [5.2.6], the navigation coefficient n is to be taken as  $n = 1,00$  unless a specific value for n has been determined by the Society based on the scatter diagram corresponding to the geographical area or the sea conditions considered.

**Table 1 : Wave parameter coefficients for strength and fatigue assessment**

Navigation notation	Assessment	$A_0$	$A_1$	$e_1$	$A_2$	$e_2$	$L_c$	$h_{lu}$ (1)
<b>unrestricted navigation</b>	Strength	1,00	1,50	2,20	0,45	1,70	486	–
	Fatigue	0,16	1,66	1,96	0,49	1,43	243	12,5
<b>summer zone</b>	Strength	0,70	1,55	2,12	0,35	1,75	354	–
	Fatigue	0,16	1,66	1,96	0,49	1,43	243	12,5
<b>tropical zone</b>	Strength	0,60	1,68	2,40	0,40	1,80	350	–
	Fatigue	0,16	1,66	1,96	0,49	1,43	243	12,5
<b>coastal area</b>	Strength	0,60	1,68	2,40	0,40	1,80	350	–
	Fatigue	0,16	1,66	1,96	0,49	1,43	243	12,5
<b>sheltered area</b>	Strength	0,38	1,65	2,45	0,35	1,80	280	–
	Fatigue	0,13	1,76	2,02	0,44	1,33	200	4,5

(1) Reference height for loading/unloading fatigue assessment, in m, to be considered for the calculation of  $f_{plu}$  according to Ch 5, Sec 3

**Table 2 : Navigation coefficient for strength assessment**

Navigation notation	Navigation coefficient n
<b>unrestricted navigation</b>	1
other navigation notations	$\frac{H}{0,85 H_{s,unrestricted}}$

**Note 1:**  
H : Wave parameter as defined in [1.1.1] for the strength assessment and corresponding to the concerned navigation notation  
 $H_{s,unrestricted}$  : Wave parameter as defined in [1.1.1] for the strength assessment and corresponding to the navigation notation **unrestricted navigation**

Table 3 : Navigation coefficient for fatigue assessment

Navigation notation	Navigation coefficient n	
	High-cycle fatigue assessment	Fatigue assessment due to loading /unloading
<b>unrestricted navigation</b>	1	$\frac{H_{f-LU}}{H_{f-H,unrestricted}}$
other navigation notations	$\frac{H_{f-H}}{H_{f-H,unrestricted}}$	
<p><b>Note 1:</b>  <math>H_{f-H}</math> : Wave parameter as defined in [1.1.1] for the high cycle fatigue assessment and corresponding to the concerned navigation notation  <math>H_{f-LU}</math> : Wave parameter as defined in [1.1.1] for the loading/unloading fatigue assessment and corresponding to the concerned navigation notation  <math>H_{f-H,unrestricted}</math> : Wave parameter as defined in [1.1.1] for the high cycle fatigue assessment and corresponding to the navigation notation <b>unrestricted navigation</b></p>		

## 2 Ship motions and accelerations

### 2.1 Ship motions

#### 2.1.1 Roll motion

The roll period  $T_\theta$ , in s, is to be taken as:

$$T_\theta = \frac{2,3\pi k_r}{\sqrt{g GM}}$$

The roll angle  $\theta$ , in deg, is to be taken as:

$$\theta = \frac{9000 (1,25 - 0,025 T_\theta)}{(B + 75)\pi} \cdot f_{fa} \cdot f_{BK}$$

without being taken less than:

$$\frac{1862}{B + 75} \cdot f_{fa} \cdot f_{BK}$$

where:

$f_{fa}$  : Coefficient, to be taken as:

- for strength assessment:  
 $f_{fa} = f_{ps} \cdot n$
- for fatigue assessment:  
 $f_{fa} = 0,9 (0,23 - 4 \cdot 10^{-4} B f_T) n$

$f_T$  : Ratio between draught at the considered loading condition and scantling draught, to be taken as:

$$f_T = \max (T_{LC} / T_{SC} ; 0,5)$$

without being taken greater than 1

$f_{BK}$  : To be taken as:

- for ships without bilge keel:  
 $f_{BK} = 1,2$
- for ships with bilge keel:  
 $f_{BK} = 1,0$

GM : Metacentric height, in m, for the considered loading condition, as defined in Tab 4, unless a different value is given in the loading manual

$k_r$  : Roll radius of gyration, in m, for the considered loading condition, as defined in Tab 4

n : Navigation coefficient as defined in [1.1.2] for a reference length  $L_{ref}$  calculated with:

$$\alpha = \frac{4,6}{T_R^2}$$

$$f_\alpha = 1,0$$

**2.1.2 Pitch motion**

The pitch period  $T_\phi$ , in s, is to be taken as:

$$T_\phi = 0,8\sqrt{L}$$

The pitch angle  $\phi$ , in deg, is to be taken as:

$$\phi = \frac{1970 \cdot f_R \cdot f_S \cdot f_{nl} \cdot H}{L \cdot C_{W-LC}^{0,75}}$$

where:

H : Wave parameter for a reference length  $L_{ref}$  calculated with:

$$\alpha = 0,56$$

$f_\alpha$  calculated with  $C_\alpha = -0,85$  for fatigue assessment

$f_S$  : Speed effect coefficient calculated with  $C_S = 0,9$  for fatigue assessment.

**Table 4 : Values of  $k_r$ , GM,  $C_{B-LC}$  and  $C_{W-LC}$**

Loading condition (1)	service notation	$T_{LC}$	$k_r$	GM	$C_{B-LC}$	$C_{W-LC}$
Full load condition	<b>oil tanker, bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP</b>	$T_{sc}$	0,35 B	0,12 B	$C_B$	$C_W$
	Other ships			0,07 B		
Full load condition with reduced draught	<b>oil tanker, bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP</b>	Actual draught	0,35 B	0,12 B	$C_B$	$C_W$
	Other ships			0,07 B		
Design fatigue condition	<b>container ship</b>	$0,85 T_{sc}$	0,35 B	0,07 B	$C_B$	$C_W$
Partial load condition	<b>oil tanker</b>	$0,6T_{sc}$	0,40 B	0,24 B	$C_{B-LC}$	$C_{W-LC}$
	<b>FLS tanker, asphalt carrier, chemical tanker, tanker, combination carrier</b>		0,35 B	0,07 B		
Full load / homogeneous heavy cargo condition	<b>bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP</b>	$T_{sc}$	0,42 B	0,25 B	$C_B$	$C_W$
Steel coils condition	<b>bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP</b>	$T_{sc}$	0,42 B	0,25 B	$C_B$	$C_W$
Alternate heavy cargo condition	<b>bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP</b>	$T_{sc}$	0,40 B	0,20 B	$C_B$	$C_W$
Alternate light cargo condition	<b>bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP</b>	$T_{sc}$	0,35 B	0,12 B	$C_B$	$C_W$
Heavy ballast condition	<b>bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP</b>	$T_{BAL-H}$	0,40 B	0,25 B	$C_{B-LC}$	$C_{W-LC}$
Normal ballast condition	<b>oil tanker, bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP</b>	$T_{BAL}$	0,45 B	0,33 B	$C_{B-BAL}$	$C_{W-BAL}$
	Other ships			0,18 B		

(1) For Multi-port (MP) of **bulk carrier, bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP** and **combination carrier** (limited to direct strength analysis):

- loading conditions with draught amidships greater than or equal to  $0,9 T_{sc}$ , the values of  $k_r$  and GM, unless provided in the loading manual, are to be taken as those from the most appropriate full load condition.  $C_{B-LC}$  and  $C_{W-LC}$  are to be taken equal to respectively  $C_B$  and  $C_W$ .
- loading conditions with draught amidships between  $T_{BAL-H}$  and  $0,9 T_{sc}$ , the values of  $k_r$  and GM, unless provided in the loading manual, are to be obtained by linear interpolation, based on the draught, between the heavy ballast condition and the most appropriate full load condition.  $C_{B-LC}$  and  $C_{W-LC}$  are to be taken as provided in the loading manual.
- loading conditions with a draught amidships below  $T_{BAL-H}$ , the values of  $k_r$  and GM for the heavy ballast condition are to be used.  $C_{B-LC}$  and  $C_{W-LC}$  are to be taken as provided in the loading manual.

## 2.2 Accelerations at the centre of gravity

### 2.2.1 Surge acceleration

The longitudinal acceleration due to surge, in m/s<sup>2</sup>, is to be taken as:

$$a_{\text{surge}} = \frac{115 \cdot f_R \cdot f_S \cdot f_{nl} \cdot H}{L \cdot f_{TL}^{0,2} \cdot C_{B-LC}^{0,6}}$$

where:

H : Wave parameter for a reference length  $L_{\text{ref}}$  calculated with:

$$\alpha = \frac{0,37}{C_{W-LC}^{0,9}}$$

$$f_{\alpha} = 1,0$$

$f_S$  : Speed effect coefficient to be taken as:

$$f_S = 1,0.$$

### 2.2.2 Sway acceleration

The transverse acceleration due to sway, in m/s<sup>2</sup>, is to be taken as:

$$a_{\text{sway}} = \frac{115 \cdot f_R \cdot f_S \cdot f_{nl} \cdot H}{L \cdot f_{TL}^{0,15} \cdot f_{BL}^{0,5}}$$

where:

H : Wave parameter for a reference length  $L_{\text{ref}}$  calculated with:

$$\alpha = \frac{0,24}{f_{BL}^{0,65}}$$

$$f_{\alpha} = 1,0$$

$f_S$  : Speed effect coefficient to be taken as:

$$f_S = 1,0$$

### 2.2.3 Heave acceleration

The vertical acceleration due to heave, in m/s<sup>2</sup>, is to be taken as:

$$a_{\text{heave}} = \frac{350 \cdot f_R \cdot f_S \cdot f_{nl} \cdot H}{L \cdot f_{BL}^{0,5}}$$

where:

H : Wave parameter for a reference length  $L_{\text{ref}}$  calculated with:

$$\alpha = \frac{0,35}{f_{TL}^{0,35}}$$

$f_{\alpha}$  calculated with  $C_{\alpha} = (-16,3 f_{TL} - 1,10)$  for fatigue assessment

$f_S$  : Speed effect coefficient calculated with  $C_S = (19,7 f_{TL} + 0,55)$  for fatigue assessment.

### 2.2.4 Roll acceleration

The roll acceleration,  $a_{\text{roll}}$ , in rad/s<sup>2</sup>, is to be taken as:

$$a_{\text{roll}} = \theta \frac{\pi}{180} \left( \frac{2\pi}{T_{\theta}} \right)^2$$

### 2.2.5 Pitch acceleration

The pitch acceleration,  $a_{\text{pitch}}$ , in rad/s<sup>2</sup>, is to be taken as:

$$a_{\text{pitch}} = 6 \cdot 10^4 \cdot \frac{\pi}{180} \cdot \frac{f_R \cdot f_S \cdot f_{nl} \cdot H}{L^2 \cdot f_{BL}^{0,5} \cdot C_{W-LC}^{1,5}}$$

where:

H : Wave parameter for a reference length  $L_{\text{ref}}$  calculated with:

$$\alpha = \frac{0,24}{f_{BL}^{0,8}}$$

$f_{\alpha}$  calculated with  $C_{\alpha} = (2,83 - 9,13 C_{B-LC})$  for fatigue assessment

$f_S$  : Coefficient calculated with  $C_S = 2,11$  for fatigue assessment.

### 2.2.6 Yaw acceleration

The yaw acceleration,  $a_{yaw}$ , in  $\text{rad/s}^2$ , is to be taken as:

$$a_{yaw} = 200,4 \cdot 10^2 \cdot \frac{\pi}{180} \cdot \frac{f_R \cdot f_S \cdot f_{nl} \cdot H}{L^2 \cdot f_{BL}^{0,73}}$$

where:

$H$  : Wave parameter for a reference length  $L_{ref}$  calculated with:

$$\alpha = \frac{1,14}{C_{B-LC}^{0,7}}$$

$$f_{\alpha} = 1,0$$

$f_S$  : Coefficient to be taken as  $f_S = 1,0$  for fatigue assessment.

## 3 Accelerations at any position

### 3.1 General

**3.1.1** The accelerations used to derive the inertial loads at any position are defined with respect to the ship fixed coordinate system. Hence the acceleration values defined in [3.2.2] and [3.2.3] include the gravitational acceleration components due to the instantaneous roll and pitch angles.

**3.1.2** The accelerations to be applied for the dynamic load cases defined in Ch 5, Sec 2 are given in [3.2].

**3.1.3** When required for the assessment of equipments, their foundations and supporting structures, guidance for the determination of the load cases maximizing the various acceleration components is given in [3.3].

### 3.2 Accelerations for dynamic load cases

#### 3.2.1 General

The accelerations to be applied for the dynamic load cases defined in Ch 5, Sec 2 are given in [3.2.2] to [3.2.4].

#### 3.2.2 Longitudinal acceleration

The longitudinal acceleration  $a_x$  at any position for each dynamic load case, in  $\text{m/s}^2$ , is to be taken as:

$$a_x = -C_{XG} g \sin(f_{\beta}\phi) + f_{\beta} (C_{XS} a_{surge} + C_{XP} a_{pitch-x} - C_{XY} a_{yaw-x})$$

where:

$a_{pitch-x}$  : Longitudinal acceleration due to pitch, in  $\text{m/s}^2$ :

$$a_{pitch-x} = a_{pitch} (z - z_G)$$

$a_{yaw-x}$  : Longitudinal acceleration due to yaw, in  $\text{m/s}^2$ :

$$a_{yaw-x} = a_{yaw} y$$

#### 3.2.3 Transverse acceleration

The transverse acceleration  $a_y$  at any position for each dynamic load case, in  $\text{m/s}^2$ , is to be taken as:

$$a_y = C_{YG} g \sin \theta + f_{\beta} (C_{YS} a_{sway} + C_{YY} a_{yaw-y}) - C_{YR} a_{roll-y}$$

where:

$a_{roll-y}$  : Transverse acceleration due to roll, in  $\text{m/s}^2$ :

$$a_{roll-y} = a_{roll} (z - z_G)$$

$a_{yaw-y}$  : Transverse acceleration due to yaw, in  $\text{m/s}^2$ :

$$a_{yaw-y} = a_{yaw} (x - x_G)$$

#### 3.2.4 Vertical acceleration

The vertical acceleration  $a_z$  at any position for each dynamic load case, in  $\text{m/s}^2$ , is to be taken as:

$$a_z = f_{\beta} (C_{ZH} a_{heave} - C_{ZP} a_{pitch-z}) + C_{ZR} a_{roll-z}$$

where:

$a_{roll-z}$  : Vertical acceleration due to roll, in  $\text{m/s}^2$ :

$$a_{roll-z} = a_{roll} y$$

$a_{pitch-z}$  : Vertical acceleration due to pitch, in  $\text{m/s}^2$ :

$$a_{pitch-z} = a_{pitch} (x - x_G)$$

### **3.3 Maximum accelerations for equipment**

#### **3.3.1 General**

As a guidance for the assessment of equipments, their foundations and supporting structures, the various acceleration components are generally (but not necessarily) maximized by the following load cases:

- $a_x$  : OVA for all ship areas
- $a_y$  : BP for fore and midship areas, OVA for the aft area
- $a_z$  : OVA for fore an aft areas, BP for the midship area.

# Section 4 Hull Girder Loads

## Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

C : Wave coefficient:

$$C = (118 - 0,36L) \frac{L}{1000} \text{ for } 65 \text{ m} \leq L < 90 \text{ m}$$

$$C = 10,75 - \left( \frac{300 - L}{100} \right)^{1,5} \text{ for } 90 \text{ m} \leq L < 300 \text{ m}$$

$$C = 10,75 \text{ for } 300 \text{ m} \leq L \leq 350 \text{ m}$$

$$C = 10,75 - \left( \frac{L - 350}{150} \right)^{1,5} \text{ for } L > 350 \text{ m}$$

$C_{B-LC}$  : Block coefficient, as defined in Ch 5, Sec 3

F : Froude's number at 0,75 V, as defined in Ch 5, Sec 3

$f_{BL}$  : Ratio between moulded breadth and rule length as defined in Ch 5, Sec 3

$f_{\beta}$  : Heading correction factor as defined in Ch 5, Sec 3

H : Wave parameter, as defined in Ch 5, Sec 3

$\Delta Q_{swf}$  : Shear force correction at the transverse section considered, in kN, taken as:

- For ships carrying dry bulk cargo,  $\Delta Q_{md-fwd}$  as defined in Ch 8, App 1, [4.3.4].
- For other ships,  $\Delta Q_{swf} = 0$ .

## 1 Application

### 1.1 General

**1.1.1** The hull girder loads for the static design load scenarios are to be taken as the still water loads defined in Article [2].

**1.1.2** The total hull girder loads for the static + dynamic design load scenarios are to be derived for each dynamic load case and are to be taken as the sum of the still water loads defined in [2] and the dynamic loads defined in [3.6].

## 2 Still water loads

### 2.1 General

#### 2.1.1 Still water load calculation

Still water loads are to be calculated for all the design loading conditions defined in Ch 5, Sec 8 and subdivided into departure and arrival conditions.

The longitudinal distributions of still water bending moment and shear force are to be calculated, for each of the loading conditions, on the basis of realistic data related to the amount of cargo, ballast, fuel, lubricating oil and fresh water.

Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also, where any ballasting and/or deballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or deballasting any ballast tank are to be submitted and, where approved, included in the loading manual for guidance.

The actual hull lines and lightweight distribution are to be taken into account in the calculations. The lightweight distribution may be replaced, if the actual values are not available, by a statistical distribution of weights accepted by the Society.

The designer is to supply the data necessary to verify the calculations of still water loads.

#### 2.1.2 Seagoing and harbour/sheltered water conditions

The designer is to provide the permissible still water bending moment and shear force distributions for seagoing and harbour/sheltered water operations.

The permissible still water hull girder loads are to be given, as a minimum:

- at each transverse bulkhead in the cargo hold region
- at the collision bulkhead

- at the engine room forward bulkhead, and
- at the mid-point between the forward and aft engine room bulkheads.

The permissible hull girder bending moments and shear forces at any other position may be obtained by linear interpolation. Distributions of permissible still water bending moments and shear forces are to be provided in the loading manual.

**2.1.3 Still water loads for the fatigue assessment**

The still water bending moments,  $M_{sw}$ , to be used for the fatigue assessment are to be taken as defined in Tab 1 for each loading condition representative of the intended operation of the ship, given in Ch 10, Sec 1, [2].

**Table 1 : Still water bending moment for fatigue assessment**

Service notation	Loading condition	$M_{sw}$
<b>ro-ro cargo ship, PCTC, PCC passenger ship or ro-ro passenger ship</b>	Full load condition	1,00 $M_{sw-max}$
<b>container ship</b>	Loaded at 0,85 $T_{sc}$	1,00 $M_{sw-max}$
<b>bulk carrier, bulk carrier ESP self-unloading bulk carrier ESP ore carrier ESP combination carrier ESP</b>	Heavy ballast condition	<ul style="list-style-type: none"> <li>• 0,75 <math>M_{sw-min}</math> in way of ballasted hold</li> <li>• 0,45 <math>M_{sw-max}</math> in way of other cargo holds</li> <li>• linear interpolation between 0,75 <math>M_{sw-min}</math> and 0,45 <math>M_{sw-max}</math> for cargo holds adjacent to ballasted hold</li> </ul>
all other service notations	Full load condition	1,00 $M_{sw-min}$
	Normal ballast condition	1,00 $M_{sw-max}$
$M_{sw-max}$ , $M_{sw-min}$ : permissible vertical still water bending moments in seagoing condition as defined in [2.2.1].		

**2.2 Vertical still water bending moments**

**2.2.1 Permissible vertical still water bending moments in seagoing condition**

The permissible vertical still water bending moments in seagoing condition  $M_{sw-max}$  and  $M_{sw-min}$ , at any longitudinal position, are to envelop:

- the maximum and minimum still water bending moments calculated, respectively, for all seagoing loading conditions defined in Ch 5, Sec 8. Loading conditions encountered during ballast water exchange need not to be considered for the flooded condition.
- the still water bending moments for all seagoing loading conditions defined in the loading manual.

**2.2.2 Permissible vertical still water bending moments in harbour/sheltered water condition**

The permissible vertical still water bending moments in harbour/sheltered water condition  $M_{sw-p-max}$  and  $M_{sw-p-min}$ , at any longitudinal position, are to envelop:

- the maximum and minimum still water bending moments, respectively, for all harbour/sheltered water loading conditions defined in Ch 5, Sec 8
- the still water bending moments for all harbour/sheltered water loading conditions defined in the loading manual
- the permissible still water bending moment in seagoing condition, defined in [2.2.1].

**2.2.3 Preliminary still water bending moment**

When the permissible still water bending moments are not defined, as a guidance at a preliminary stage,  $M_{sw-max}$  and  $M_{sw-min}$ , in kN·m, may be taken as:

$$M_{sw-max} = f_{sw} \left( 190 \frac{1+n}{2} C \cdot L^2 \cdot B(C_B + 0,7) 10^{-3} - M_{wv-h-mid} \right)$$

$$M_{sw-min} = -f_{sw} \left( 190 \frac{1+n}{2} C \cdot L^2 \cdot B(C_B + 0,7) 10^{-3} + M_{wv-s-mid} \right)$$

where:

$f_{sw}$  : Distribution factor along the ship length, to be taken as follows (see Fig 1):

- $f_{sw} = 0,0$  for  $x \leq 0$
- $f_{sw} = 0,15$  at  $x = 0,1 L$
- $f_{sw} = 1,00$  for  $0,3 L \leq x \leq 0,7 L$
- $f_{sw} = 0,15$  at  $x = 0,9 L$
- $f_{sw} = 0,0$  for  $x \geq L$

Intermediate values of  $f_{sw}$  are to be obtained by linear interpolation

Figure 1 : Distribution factor  $f_{sw}$

$M_{wv-h-mid}$  : Vertical wave bending moment for strength assessment in hogging condition, as defined in:

- ships assigned the service notation **container ship**:  
Pt D, Ch 2, Sec 2, [4.2.1], calculated with  $f_{m-h} = 1,0$  and  $f_{ps} = 1,0$
- other ships:  
[3.1.1], calculated with  $F_M = 1,0$  and  $f_{ps} = 1,0$

$M_{wv-s-mid}$  : Vertical wave bending moment for strength assessment in sagging condition, as defined in:

- ships assigned the service notation **container ship**:  
Pt D, Ch 2, Sec 2, [4.2.1], calculated with  $f_{m-s} = 1,0$  and  $f_{ps} = 1,0$
- other ships:  
[3.1.1], calculated with  $F_M = 1,0$  and  $f_{ps} = 1,0$

$n$  : navigation coefficient, as defined in [3.1.1].

Note 1: For ships always in hogging condition such as container ships,  $M_{sw-min}$  may be taken as 0.

## 2.3 Vertical still water shear forces

### 2.3.1 Permissible still water shear forces in seagoing condition

The permissible vertical still water shear forces  $Q_{sw-max}$  and  $Q_{sw-min}$  in seagoing condition, at any longitudinal position, are to envelop the corrected still water shear forces for the seagoing loading conditions defined in the loading manual.

The corrected shear force values for each loading condition are to be obtained by deducting the shear force correction  $\Delta Q_{swf}$  from the values given by the loading manual.

Loading conditions encountered during ballast water exchange need not to be considered for the flooded condition.

### 2.3.2 Permissible still water shear forces in harbour/ sheltered water and tank testing condition

The permissible vertical still water shear forces  $Q_{sw-p-max}$  and  $Q_{sw-p-min}$  in harbour/sheltered water and tank testing conditions, at any longitudinal position, are to envelop:

- the corrected still water shear forces for the harbour/sheltered water loading conditions defined in the loading manual
- the permissible still water shear forces in seagoing condition as defined in [2.3.1].

The corrected shear force values for each loading condition are to be obtained by deducting the shear force correction  $\Delta Q_{swf}$  from the values given by the loading manual.

## 3 Wave loads

### 3.1 Vertical wave bending moments

#### 3.1.1 Vertical wave bending moments for strength assessment

For strength assessment purposes the vertical wave bending moments  $M_{wv-h}$  and  $M_{wv-s}$  at any longitudinal position in kN.m, are to be taken as:

- hogging conditions:  
 $M_{wv-h} = 190 F_M f_{ps} n C L^2 B C_B 10^{-3}$
- sagging conditions:  
 $M_{wv-s} = - 110 F_M f_{ps} n C L^2 B (C_B + 0,7) 10^{-3}$

where:

$F_M$  : Distribution factor along the ship length, to be taken as follows (see Fig 2):

- $F_M = 0,0$  for  $x \leq 0$
- $F_M = 1,0$  for  $0,4L \leq x \leq 0,65L$
- $F_M = 0,0$  for  $x \geq L$

Intermediate values of  $F_M$  are to be obtained by linear interpolation

$f_{ps}$  : Coefficient for strength assessments as defined in Ch 5, Sec 3

$n$  : Navigation coefficient as defined in Ch 5, Sec 3, [1.1.2] for a reference length calculated with:

$$\alpha = \frac{315}{486} \cdot \frac{1}{C_W^{1,3}}$$

$$f_\alpha = 1,0$$

**Figure 2 : Distribution factor  $F_M$**

**3.1.2 Bow flare impact**

The sagging wave bending moment for strength assessment is to be increased according to [3.1.3] in order to account for the effect of bow flare impact where all the following conditions occur:

- $120 \text{ m} \leq L \leq 200 \text{ m}$
- $V \geq 17,5$  knots
- $\frac{400F(A_{DK} - A_{WL})}{3LB} > 1$

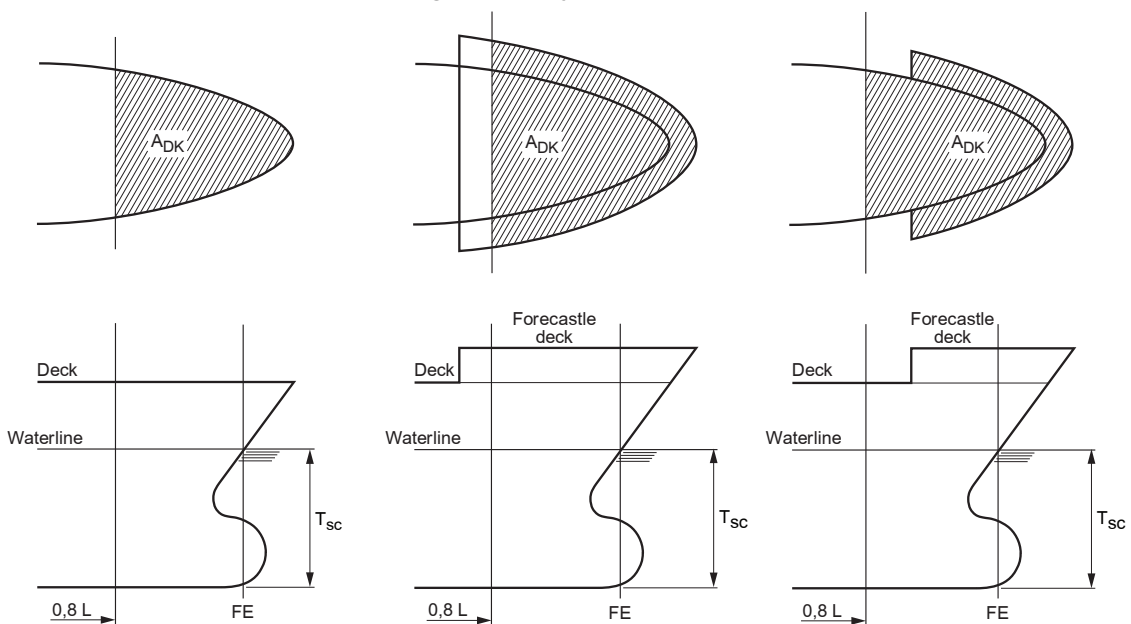

$A_{DK}$  : Projected area to the horizontal plane of decks, in  $\text{m}^2$ , including the forecastle deck, extending from  $0,8 L$  forward (see Fig 3)

$A_{WL}$  : Waterplane area, in  $\text{m}^2$ , at scantling draught  $T_{sc}$ , extending from  $0,8 L$  forward

The Society may require the effects of bow flare impact to be considered also when one of the above conditions does not occur, if deemed necessary on the basis of the ship’s characteristics. In such cases, the increase in sagging wave bending moment is defined on a case by case basis.

Note 1: This requirement is not applicable to ships assigned the service notation **container ship**.

**Figure 3 : Projected area  $A_{DK}$**

**3.1.3 Increase of the vertical wave bending moment due to bow flare impact**

The sagging wave bending moment for strength assessment at any longitudinal position, defined in [3.1.1], is to be multiplied by the coefficient  $F_D$  obtained from the formulae in Tab 2, which takes into account the dynamic effects of bow flare impact.

Where at least one of the conditions in [3.1.2] does not occur, the coefficient  $F_D$  may be taken equal to 1.

As an alternative to the above formulae, the Society may accept the evaluation of the effects of bow flare impact from direct calculations, when justified on the basis of the ship's characteristics and intended service. The calculations are to be submitted to the Society for approval.

**Table 2 : Coefficient  $F_D$**

Hull transverse section location	Coefficient $F_D$
$0 \leq x < 0,4 L$	1
$0,4 L \leq x < 0,5 L$	$1 + 10(C_D - 1)\left(\frac{x}{L} - 0,4\right)$
$0,5 L \leq x \leq L$	$C_D$

**Note 1:**  
 $C_D = 262,5 \frac{A_{DK} - A_{WL}}{CLB(C_B + 0,7)} - 0,6$  with  $1,0 \leq C_D \leq 1,2$   
 $A_{DK}$  and  $A_{WL}$  are defined in [3.1.2]

**3.1.4 Vertical wave bending moments for fatigue assessment**

For fatigue assessment purpose, the vertical wave bending moments  $M_{wv-h}$  and  $M_{wv-s}$ , in kN-m, at any longitudinal position, are to be taken as:

- in hogging condition:  $M_{wv-h} = 1,5 f_{m-h} H L^3 C_W f_{BL}^{0,8}$
- in sagging condition:  $M_{wv-s} = -1,5 f_{m-s} H L^3 C_W f_{BL}^{0,8}$

where:

$f_{m-h}$  : Distribution factor for vertical wave bending moment in hogging condition along the ship's length, to be taken as follows (see Fig 4):

- $f_{m-h} = 0,0$  for  $x \leq 0$
- $f_{m-h} = 0,15$  for  $x = 0,1 L$
- $f_{m-h} = 1,00$  for  $0,35 L \leq x \leq 0,55 L$
- $f_{m-h} = 0,25$  for  $x = 0,8 L$
- $f_{m-h} = 0,0$  for  $x \geq L$

Intermediate values of  $f_{m-h}$  are to be obtained by linear interpolation.

**Figure 4 : Distribution factor  $f_{m-h}$**

$f_{m-s}$  : Distribution factor for vertical wave bending moment in sagging condition along the ship's length, to be taken as follows (see Fig 5):

- $f_{m-s} = 0,0$  for  $x \leq 0$
- $f_{m-s} = 1,0$  for  $0,35 L \leq x \leq 0,6 L$
- $f_{m-s} = 0,0$  for  $x \geq L$

Intermediate values of  $f_{m-s}$  are to be obtained by linear interpolation

Figure 5 : Distribution factor  $f_{m-s}$

H : Wave parameter for a reference length  $L_{ref}$  calculated with:

$$\alpha = \frac{315}{486} \cdot \frac{1}{C_W^{1,3}}$$

$$f_\alpha = 1,0$$

### 3.2 Vertical wave shear force

#### 3.2.1 Vertical wave shear force for strength assessment

For strength assessment purposes, the vertical wave shear forces  $Q_{wv-pos}$  and  $Q_{wv-neg}$ , in kN, at any longitudinal position, are to be taken as:

$$Q_{wv-pos} = 30 F_{Q-pos} f_{ps} n C L B (C_B + 0,7) 10^{-2}$$

$$Q_{wv-neg} = 30 F_{Q-neg} f_{ps} n C L B (C_B + 0,7) 10^{-2}$$

where:

$F_{Q-pos}$  : Distribution factor along the ship length for positive shear force, to be taken as (see Fig 6):

- $F_{Q-pos} = 0,0$  for  $x \leq 0$
- $F_{Q-pos} = 0,92 \cdot \frac{190C_B}{110(C_B + 0,7)}$  for  $0,2L \leq x \leq 0,3L$
- $F_{Q-pos} = 0,7$  for  $0,4L \leq x \leq 0,6L$
- $F_{Q-pos} = 1,0$  for  $0,7L \leq x \leq 0,85L$
- $F_{Q-pos} = 0,0$  for  $x \geq L$

$F_{Q-neg}$  : Distribution factor along the ship length for negative shear force, to be taken as (see Fig 6):

- $F_{Q-neg} = 0,0$  for  $x \leq 0$
- $F_{Q-neg} = -0,92$  for  $0,2L \leq x \leq 0,3L$
- $F_{Q-neg} = -0,7$  for  $0,4L \leq x \leq 0,6L$
- $F_{Q-neg} = -\frac{190C_B}{110(C_B + 0,7)}$  for  $0,7L \leq x \leq 0,85L$
- $F_{Q-neg} = 0,0$  for  $x \geq L$

Figure 6 : Distribution factor  $F_{Q-pos}$  and  $F_{Q-neg}$

n : Navigation coefficient as defined in Ch 5, Sec 3, [1.1.2] for a reference length calculated with:

$$\alpha = \frac{330}{486} \cdot \frac{1}{C_W^{1,3}}$$

$$f_\alpha = 1,0$$

**3.2.2 Vertical wave shear force for fatigue assessment**

For fatigue assessment purposes, the vertical wave shear forces  $Q_{wv-pos}$  and  $Q_{wv-neg}$ , in kN, at any longitudinal position, are to be taken as:

$$Q_{wv-pos} = f_{q-pos} H L^2 C_W f_{BL}^{0,8}$$

$$Q_{wv-neg} = - f_{q-neg} H L^2 C_W f_{BL}^{0,8}$$

where:

$f_{q-pos}$  : Distribution factor along the ship length for positive wave shear force, to be taken as (see Fig 7):

- $f_{q-pos} = 0,0$  for  $x \leq 0$
- $f_{q-pos} = 5,2$  for  $0,15L \leq x \leq 0,3L$
- $f_{q-pos} = 4,0$  for  $0,4L \leq x \leq 0,55L$
- $f_{q-pos} = 5,7$  for  $0,65L \leq x \leq 0,85L$
- $f_{q-pos} = 0,0$  for  $x \geq L$

Intermediate values of  $f_{q-pos}$  are to be obtained by linear interpolation.

**Figure 7 : Distribution factor  $f_{q-pos}$**

$f_{q-neg}$  : Distribution factor along the ship length for negative wave shear force, to be taken as (see Fig 8):

- $f_{q-neg} = 1,3$  for  $x \leq 0$
- $f_{q-neg} = 5,2$  for  $0,15L \leq x \leq 0,3L$
- $f_{q-neg} = 4,0$  for  $0,4L \leq x \leq 0,50L$
- $f_{q-neg} = 5,7$  for  $0,6L \leq x \leq 0,75L$
- $f_{q-neg} = 0,0$  for  $x \geq L$

Intermediate values of  $f_{q-neg}$  are to be obtained by linear interpolation

H : Wave parameter for a reference length  $L_{ref}$  calculated with:

$$\alpha = \frac{330}{486} \cdot \frac{1}{C_W^{1,3}}$$

$$f_\alpha = 1,0$$

**Figure 8 : Distribution factor  $f_{q-neg}$**

### 3.3 Horizontal wave bending moment

3.3.1 The horizontal wave bending moment  $M_{wh}$ , in kN·m, at any longitudinal position, is to be taken as:

$$M_{wh} = 2,6 \cdot f_R \cdot f_S \cdot f_{nl} \cdot f_m \cdot H \cdot L^3 \cdot C_{B-LC}^{0,3} \cdot \left(\frac{T_{LC}}{L}\right)^{0,8}$$

where:

$f_R$  : Routing factor as defined in Ch 5, Sec 3

$f_S$  : Speed effect coefficient as defined in Ch 5, Sec 3 and to be taken as  $f_S = 1,0$

$f_{nl}$  : Coefficient considering non-linear effects and to be taken equal to 1,0

$f_m$  : Distribution factor for horizontal wave bending moment along the ship length, to be taken as (see Fig 9):

- $f_m = 0,0$  for  $x \leq 0$
- $f_m = 0,25$  for  $x = 0,15 L$
- $f_m = 1,00$  for  $0,4 L \leq x \leq 0,6 L$
- $f_m = 0,20$  for  $x = 0,85 L$
- $f_m = 0,0$  for  $x \geq L$

Intermediate values of  $f_m$  are to be obtained by linear interpolation

$H$  : Wave parameter for a reference length  $L_{ref}$  calculated with:

$$\alpha = 0,65 \left(\frac{T_{LC}}{L}\right)^{-0,3}$$

$$f_\alpha = 1,0$$

Figure 9 : Distribution factor  $f_m$

### 3.4 Horizontal wave shear force

3.4.1 The horizontal wave shear force  $Q_{wh}$ , in kN, at any longitudinal position, is to be taken as:

$$Q_{wh} = Q_{wh-a} + Q_{wh-f}$$

where:

$$Q_{wh-a} = 10,2 \cdot f_R \cdot f_S \cdot f_{q-a} \cdot f_{nl} \cdot H \cdot L^2 \cdot C_{B-LC}^{0,6} \cdot \left(\frac{T_{LC}}{L}\right)^{0,8}$$

$$Q_{wh-f} = 19,2 \cdot f_R \cdot f_S \cdot f_{q-f} \cdot f_{nl} \cdot H \cdot L^2 \cdot C_{B-LC}^{0,8} \cdot \frac{T_{LC}}{L}$$

with:

$f_R$  : Routing factor as defined in Ch 5, Sec 3

$f_S$  : Speed effect coefficient as defined in Ch 5, Sec 3 and to be taken as  $f_S = 1,0$

$f_{nl}$  : Coefficient considering non-linear effects and to be taken equal to 1,0

$f_{q-a}$  : Distribution factor for the aft part of the horizontal wave shear force along the ship length, to be taken as (see Fig 10):

- $f_{q-a} = 0,0$  for  $x \leq 0$
- $f_{q-a} = 1,0$  for  $0,20 L \leq x \leq 0,35 L$
- $f_{q-a} = 0,4$  for  $0,45 L \leq x \leq 0,55 L$
- $f_{q-a} = 0,0$  for  $x \geq 0,65 L$

Intermediate values of  $f_{q-a}$  are to be obtained by linear interpolation.

Figure 10 : Distribution factor  $f_{q-a}$

$f_{q-f}$  : Distribution factor for the fore part of the horizontal wave shear force along the ship length, to be taken as (see Fig 11):

- $f_{q-f} = 0,0$  for  $x \leq 0,35 L$
- $f_{q-f} = 0,4$  for  $0,45 L \leq x \leq 0,55 L$
- $f_{q-f} = 1,0$  for  $0,65 L \leq x \leq 0,80 L$
- $f_{q-f} = 0,0$  for  $x \geq L$

Intermediate values of  $f_{q-f}$  are to be obtained by linear interpolation

H : Wave parameter for a reference length  $L_{ref}$  calculated with:

$$\alpha = 0,68 \left( \frac{T_{LC}}{L} \right)^{-0,3}$$

$$f_{\alpha} = 1,0$$

Figure 11 : Distribution factor  $f_{q-f}$

### 3.5 Wave torsional moment

**3.5.1** The wave torsional moment  $M_{wt}$ , in kN·m, at any longitudinal position with respect to the horizontal shear centre, is to be taken as:  $M_{wt} = M_{wt-a} + M_{wt-f}$

where:

$$M_{wt-a} = \text{Max}(M_{wt-a,min}, Q_{wh-a}|z_T - 0,45B|)$$

$$M_{wt-a,min} = 2,50 \cdot f_{q-a} \cdot f_R \cdot f_S \cdot H \cdot L^{0,7} \cdot B^{2,3}$$

$$M_{wt-f} = \text{Max}(M_{wt-f,min}, Q_{wh-f}|z_T - 0,30B|)$$

$$M_{wt-f,min} = 1,16 \cdot f_{q-f} \cdot f_R \cdot f_S \cdot H \cdot L \cdot B^2$$

with:

$Q_{wh-a}$ ,  $Q_{wh-f}$ : Horizontal wave shear forces as defined in [3.4.1]

$z_T$  : Vertical coordinate from baseline, in m, of the horizontal shear centre at the transverse section under consideration.  
When  $z_T$  is not known, the value is to be taken equal to  $-0,35 B$  for ships having large openings in the strength decks as defined in Ch 6, Sec 1, [1.6]

- $f_R$  : Routing factor as defined in Ch 5, Sec 3
- $f_S$  : Coefficient as defined in Ch 5, Sec 3 and to be taken as  $f_S = 1,0$  for fatigue assessment
- $f_{q-ar}, f_{q-f}$  : Distribution factors in the fore and aft part as defined in [3.4.1]
- H : Wave parameter for a reference length  $L_{ref}$  calculated with:

$$\alpha = 0,68 \left( \frac{T_{LC}}{L} \right)^{-0,3}$$

$$f_\alpha = 1,0$$

### 3.6 Hull girder loads for dynamic load cases

#### 3.6.1 Vertical wave bending moment

The vertical wave bending moment  $M_{ww-LC}$ , in kN-m, to be used for each dynamic load case in Ch 5, Sec 2, is defined in Tab 3.

**Table 3 : Vertical wave bending moment  $M_{ww-LC}$  for dynamic load cases**

$C_{WV} \geq 0$	$M_{ww-LC} = f_\beta C_{WV} M_{ww-h}$
$C_{WV} < 0$	$M_{ww-LC} = f_\beta C_{WV}  M_{ww-s} $

**Note 1:**

$C_{WV}$  : Load combination factor for vertical wave bending moment, to be taken as specified in Ch 5, Sec 2

$M_{ww-h}, M_{ww-s}$  : Hogging and sagging vertical wave bending moments taking account of the considered design load scenario, as defined in [3.1.1]

#### 3.6.2 Vertical wave shear force

The vertical wave shear force,  $Q_{ww-LC}$ , in kN, to be used for each dynamic load case in Ch 5, Sec 2, is defined in Tab 4.

**Table 4 : Vertical wave shear force  $Q_{ww-LC}$  for dynamic load cases**

$C_{QV} \geq 0$	$Q_{ww-LC} = f_\beta C_{QV} Q_{ww-pos}$
$C_{QV} < 0$	$Q_{ww-LC} = f_\beta C_{QV}  Q_{ww-neg} $

**Note 1:**

$C_{QV}$  : Load combination factor for vertical wave shear force, to be taken as specified in Ch 5, Sec 2

$Q_{ww-pos}, Q_{ww-neg}$  : Positive and negative vertical wave shear forces taking account of the considered design load scenario, as defined in [3.2.1]

#### 3.6.3 Horizontal wave bending moment

The horizontal wave bending moment  $M_{wh-LC}$ , in kN-m, to be used for each dynamic load case defined in Ch 5, Sec 2, is to be taken as:

$$M_{wh-LC} = f_\beta C_{WH} M_{wh}$$

where:

$C_{WH}$  : Load combination factor for horizontal wave bending moment, to be taken as specified in Ch 5, Sec 2

$M_{wh}$  : Horizontal wave bending moment taking account of the appropriate design load scenario, as defined in [3.3.1].

#### 3.6.4 Horizontal wave shear force

The horizontal wave shear force  $Q_{wh-LC}$ , in kN, to be used for each dynamic load case defined in Ch 5, Sec 2, is to be taken as:

$$Q_{wh-LC} = f_\beta C_{QH} Q_{wh}$$

where:

$C_{QH}$  : Load combination factor for horizontal wave bending shear force, to be taken as specified in Ch 5, Sec 2

$Q_{wh}$  : Horizontal wave shear force taking account of the appropriate design load scenario, as defined in [3.4.1].

#### 3.6.5 Wave torsional moment

The wave torsional moment  $M_{wt-LC}$ , in kN-m, to be used for each dynamic load case defined in Ch 5, Sec 2, is to be taken as:

$$M_{wt-LC} = f_\beta C_{WT} M_{wt}$$

where:

$C_{WT}$  : Load combination factor for wave torsional moment, to be taken as specified in Ch 5, Sec 2

$M_{wt}$  : Wave torsional moment taking account of the appropriate design load scenario, as defined in [3.5.1].

# Section 5 Environmental Loads

## Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

- $B_x$  : Moulded breadth at the waterline ( $T_{LC}$ ), in m, at the considered cross-section  
 $B_{x,max}$  : Greatest moulded breadth, in m, measured at the considered cross-section below the weather deck  
 $C_{B-LC}$  : Block coefficient at the considered loading condition draught, as defined in Ch 1, Sec 3, [2.1.9]  
 $C_{W-LC}$  : Waterplane coefficient at the considered loading condition draught, as defined in Ch 1, Sec 3, [2.1.10]  
 $f_\beta$  : Heading correction factor as defined in Ch 5, Sec 3  
 $f_{BL}, f_{TL}$  : Ratios as defined in Ch 5, Sec 3  
 $f_R$  : Routing factor as defined in Ch 5, Sec 3  
 $f_{yB}$  : Ratio between Y-coordinate of the load point and  $B_x$ , to be taken as:

$$f_{yB} = \frac{|2y|}{B_x}$$

without being taken greater than 1,0

$$f_{yB} = 1,0 \text{ when } B_x = 0$$

- $f_{zT}$  : Ratio between Z-coordinate of the load point and draught  $T_{LC}$ , to be taken as:

$$f_{zT} = \frac{Z}{T_{LC}}$$

without being taken less than 0

- $h_W$  : Water head equivalent to the pressure at the waterline, in m, to be taken as:

$$h_W = \frac{P_{W,WL}}{\rho g}$$

- $P_{W,WL}$  : Wave pressure at the waterline ( $T_{LC}$ ), in kN/m<sup>2</sup>, for the considered load case, to be taken as:  $P_{W,WL} = \text{Max}(P_W; 0)$   
 with  $P_W$  calculated at  $z = T_{LC}$  and:

- $y = B_x/2$  when  $y \geq 0$
- $y = -B_x/2$  when  $y < 0$

- $T_R$  : Dimensionless roll period, as defined in Ch 5, Sec 2.

## 1 Sea pressure

### 1.1 Total pressure

**1.1.1** The external pressure  $P_{ex}$  at any load point of the hull, in kN/m<sup>2</sup>, for the static design load scenarios, is to be taken as:

$$P_{ex} = P_S$$

The total pressure  $P_{ex}$  at any load point of the hull, for the static + dynamic design load scenarios, is to be derived for each load case and is to be taken as:

$$P_{ex} = P_S + P_W$$

without being taken less, for static + dynamic load scenarios other than fatigue, than:

- 2,5 kN/m<sup>2</sup> for prescriptive strength assessment
- 0 kN/m<sup>2</sup> for direct strength analysis

where:

$P_S$  : Hydrostatic pressure, in kN/m<sup>2</sup>, defined in [1.2]

$P_W$  : Hydrodynamic pressure, in kN/m<sup>2</sup>, defined in [1.3] and [1.4].

### 1.2 Hydrostatic pressure

**1.2.1** The hydrostatic pressure  $P_S$  at any load point, in kN/m<sup>2</sup>, is obtained from Tab 1. See also Fig 1.

Table 1 : Hydrostatic pressure  $P_s$

Location	$P_s$ , in $\text{kN/m}^2$
$z < T_{LC}$	$\rho g (T_{LC} - z)$
$z \geq T_{LC}$	0

Figure 1 : Distribution of hydrostatic pressure  $P_s$

### 1.3 External dynamic pressure for strength assessment

#### 1.3.1 Hydrodynamic pressure for all load cases

The hydrodynamic pressure  $P_w$  at any load point, in  $\text{kN/m}^2$ , is to be obtained, for all load cases, from Tab 2.

Table 2 : Hydrodynamic pressure  $P_w$  in  $\text{kN/m}^2$  - Strength assessment

Load case as defined in Ch 5, Sec 2, Tab 1	$z \leq T_{LC}$	$T_{LC} < z \leq h_w + T_{LC}$	$z > h_w + T_{LC}$
HVM1 FVM1 BP1-P BP1-S OHM2-P OHM2-S OHS2-P OHS2-S OVA1-P OVA1-S	$-P_{EDW}$	$P_{w,WL} - \rho g(z - T_{LC})$	0,0
HVM2 FVM2 BP2-P BP2-S OHM1-P OHM1-S OHS1-P OHS1-S OVA2-P OVA2-S	$P_{EDW}$		
BR1-P BR1-S	$-P_{EDW} + P_{SR}$		
BR2-P BR2-S	$P_{EDW} + P_{SR}$		
<b>Note 1:</b>			
$P_{EDW}$ : Hydrodynamic pressure defined in [1.3.2]			
$P_{SR}$ : Hydrostatic pressure, in $\text{kN/m}^2$ , due to the roll motion, to be taken as:			
$P_{SR} = -\rho g y \frac{C_{YG} \theta}{180} \pi$			
$C_{YG}$ : Load combination factor for the gravitational acceleration due to roll, as defined in Ch 5, Sec 2			

**1.3.2 Hydrodynamic pressure at any point**

The hydrodynamic pressure  $P_{EDW}$  for each EDW as defined in Ch 5, Sec 2, Tab 1, at any load point of the hull, in  $kN/m^2$ , is to be taken as:

- when  $f_{yB} \geq f_{zT}$ :
 
$$P_{EDW} = (1 - f_{yB})P_{CL} + (f_{yB} - f_{zT})P_{BL} + f_{zT}P_{WL}$$
- when  $f_{yB} < f_{zT}$ :
 
$$P_{EDW} = (1 - f_{zT})P_{CL} + (f_{zT} - f_{yB})P_M + f_{yB}P_{WL}$$

where:

- $P_{CL}$  : Hydrodynamic pressure at the bottom centreline (see Fig 2) defined in [1.3.3], for the considered EDW
- $P_{BL}$  : Hydrodynamic pressure at the bilge line (see Fig 2) defined in [1.3.3], for the considered EDW
- $P_{WL}$  : Hydrodynamic pressure at the waterline (see Fig 2) defined in [1.3.3], for the considered EDW
- $P_M$  : Intermediate hydrodynamic pressure (see Fig 2), to be taken as:
 
$$P_M = 0,5 (P_{WL} + P_{WL-O})$$
- $P_{WL-O}$  : Hydrodynamic pressure at the waterline on the opposite side (see Fig 2), to be taken as:
 
$$P_{WL-O} = P_{WL}$$
 with  $P_{WL}$  as defined in [1.3.3], for the considered EDW, calculated on the side opposite to the load point. When the load point is located on the centreline ( $y = 0$ ), the lee side is to be considered as the opposite side.

Note 1: Weather side and lee side are detailed in Ch 5, Sec 2, Tab 2 to Ch 5, Sec 2, Tab 7 for each load case.

**Figure 2 : Hydrodynamic pressures**

**1.3.3 Hydrodynamic pressures at the centreline, bilge and waterline**

The hydrodynamic pressures at the bottom centreline  $P_{CL}$ , at the bilge line  $P_{BL}$  and at the waterline  $P_{WL}$ , for each EDW, in  $kN/m^2$ , is to be taken as:

$$P_i = \rho g f_R f_{nl} f_B H f_{k,i}$$

where:

$$f_{k,i} = k_i + k_{T,i} f_{TL} + k_{CB,i} C_{B-LC} + k_{CW,i} C_{W-LC} + k_{B,i} f_{BL} + k_{R,i} T_R$$

- $i$  : Location where the hydrodynamic pressure is calculated, to be taken as:
  - CL at the bottom centreline
  - BL at the bilge line
  - WL at the waterline
- $H$  : Wave parameter defined in Ch 5, Sec 3, for a reference length  $L_{ref}$  calculated with  $\alpha$  to be taken in Tab 3, for the considered EDW
- $f_{nl}$  : Coefficient considering non-linear effects, to be taken in Tab 3, for the considered EDW and design load scenario
- $k_i, k_{T,i}, k_{CB,i}, k_{CW,i}, k_{B,i}, k_{R,i}$  : Coefficients in the longitudinal direction, to be taken in Tab 6 to Tab 17, for the considered EDW. Intermediate values are obtained by linear interpolation.
- When portside is the weather side for the considered load case:
  - for load points located on portside ( $y > 0$ ), the coefficients for the weather side are to be used
  - for load points located on starboard side ( $y < 0$ ), the coefficients for the lee side are to be used

- When starboard side is the weather side for the considered load case:
  - for load points located on starboard side ( $y < 0$ ), the coefficients for the weather side are to be used
  - for load points located on portside ( $y > 0$ ), the coefficients for the lee side are to be used
- When load points are located at centreline ( $y = 0$ ), the coefficients for the weather side are to be used.

**1.3.4 Envelope of dynamic pressure**

The envelope of dynamic pressure at any point  $P_{ex-max}$  is to be taken as the greatest pressure value obtained from any of the load cases in accordance with [1.3.1].

**1.4 External dynamic pressure for fatigue assessment**

**1.4.1 Hydrodynamic pressure for all load cases**

The hydrodynamic pressure  $P_w$  for all load cases, at any load point, in  $kN/m^2$ , is to be taken as:

$$P_w = f_{iw} P_{wfl}$$

where:

- $P_{wfl}$  : hydrodynamic pressure, in  $kN/m^2$ , as defined in Tab 18
- $f_{iw}$  : factor accounting for the non-linearity due to intermittent wetting, to be taken as defined in Tab 19.

**Table 3 : Coefficients for hydrodynamic pressure strength assessment**

EDW	$\alpha$	$f_{nl}$ (1)
HVM	$0,65 C_{W-LC}^{-1,3}$	$f_{nl-1}$
FVM	$0,65 C_{W-LC}^{-1,3}$	$f_{nl-2}$
BR	$4,6 T_R^{-2}$	$f_{nl-3}$
BP	$0,55 f_{TL}^{-0,4}$	$f_{nl-4}$
OHM	$0,65 f_{TL}^{-0,3}$	$f_{nl-5}$
OHS	$0,68 f_{TL}^{-0,3}$	$f_{nl-5}$
OVA	$0,24 f_{BL}^{-0,8}$	$f_{nl-6}$

(1)  $f_{nl-1}$  to  $f_{nl-6}$  are to be taken from:

- Tab 4 for extreme sea design load scenario
- Tab 5 for ballast water exchange design load scenario.

**Table 4 : Non-linear coefficients  $f_{nl}$  for extreme sea design load scenario**

## **2 Sea chests**

### **2.1 Design pressure**

**2.1.1** In addition to the sea pressure  $P_{ex}$ , in  $\text{kN/m}^2$ , as calculated in Article [1] for sides and bottom, the pressure  $P_{sc}$  defined by the designer to cover the hazard of an overpressure due to the inlet grating cleaning system is to be considered for the scantling of sea chests without being taken less than  $200 \text{ kN/m}^2$ .

## **3 External pressure on exposed decks**

### **3.1 Application**

**3.1.1** External pressure on exposed decks is only to be applied for strength assessment.

**3.1.2** Green sea pressure defined in [3.2] for exposed decks is to be considered independently of the pressure due to:

- distributed cargo or other equipment loads, and
- any concentrated forces due to cargo or other unit equipment loads,

defined in Ch 5, Sec 6, [6.1] and Ch 5, Sec 6, [6.2] respectively.

### **3.2 Green sea loads**

#### **3.2.1 Pressure on exposed deck**

The external dynamic pressure due to green sea  $P_d$  at any point of an exposed deck, in  $\text{kN/m}^2$ , for the static + dynamic design load scenarios is to be derived for each dynamic load case and is to be taken as defined in [3.2.3] to [3.2.4].

The external dynamic pressure due to green sea  $P_d$  at any point of an exposed deck for the static design load scenario is zero.

**3.2.2** If a breakwater is fitted on the exposed deck, no reduction of the external dynamic pressure due to green sea is allowed for the area of the exposed deck located aft of the breakwater.

#### **3.2.3 HVM and FVM load cases**

The external pressure  $P_d$  for HVM and FVM load cases at any load point of an exposed deck, in  $\text{kN/m}^2$ , is to be obtained from the following formula:

$$P_d = \max(P_{W,dr} \chi P_{W,d-\min})$$

where:

$P_{W,d}$  : Pressure, in  $\text{kN/m}^2$ , obtained at the side of the ship ( $y = \pm B_{x,\max}/2$ ) at considered deck height for HVM and FVM load cases as defined in [1.3]

$\chi$  : Coefficient defined in Tab 29

$P_{W,d-\min}$  : Pressure to be taken as:

- $P_{W,d-\min} = 0$  for direct strength analysis according to Part B, Chapter 8
- The value defined in Tab 30 for the other analyses.

#### **3.2.4 BR, BP, OHM, OHS and OVA load cases**

The external pressure  $P_d$  for BR, BP, OHM, OHS and OVA load cases, as defined in Ch 5, Sec 2, Tab 1 at any load point of an exposed deck, in  $\text{kN/m}^2$ , is to be obtained by linear interpolation between the pressure values at port and starboard side:

$$P_{d,\text{stb}} = P_{W,d-\text{stb}}$$

$$P_{d,\text{pt}} = P_{W,d-\text{pt}}$$

where:

$P_{W,d-\text{stb}}$  : Pressure obtained at starboard side of the ship at considered deck height, to be calculated for BR, BP, OHM, OHS or OVA load cases as per [1.3] as appropriate, considering:

- $x$  = longitudinal coordinate of the calculation point
- $y = -B_{x,\max}/2$
- $z$  = vertical coordinate of the calculation point

$P_{W,d-\text{pt}}$  : Pressure obtained at port side at considered deck height for BR, BP, OHM, OHS, and OVA load cases as defined in [1.3], as appropriate, considering:

- $x$  = longitudinal coordinate of the calculation point
- $y = B_{x,\max}/2$
- $z$  = vertical coordinate of the calculation point.

**Table 29 : Coefficient  $\chi$  for pressure on exposed decks**

Exposed deck location	$\chi$
Freeboard deck and within the lowest tier	1,00
Within the second tier	0,75
Within the third tier	0,56
Within the fourth tier	0,42
Within the fifth tier	0,32
Within the sixth tier	0,25
Within the seventh tier	0,20
Within the eighth tier	0,15
Top of eighth tier and above	0,10

**Note 1:** When a deck is located at the limit between two tiers, the coefficient from the tier above is to be considered.

**Table 30 : Minimum pressure on exposed deck  $P_{W,d-min}$**

Load line length $L_{LL}$ , in m	Longitudinal position	Minimum pressure on exposed deck $P_{W,d-min}$ , in kN/m <sup>2</sup>
$L_{LL} < 100$	$0 \leq x \leq 0,75 L_{LL}$	$14,9 + 0,195 L_{LL}$
	$0,75 L_{LL} < x \leq L_{LL}$	$15,8 + \frac{L_{LL}}{3} \left(1 - \frac{5(L_{LL} - x)}{L_{LL}}\right) - \left(3,6 \frac{(L_{LL} - x)}{L_{LL}}\right)$
$L_{LL} \geq 100$	$0 \leq x \leq 0,75 L_{LL}$	34,3
	$0,75 L_{LL} < x \leq L_{LL}$	$34,3 + \frac{P_{WP} - 34,3}{0,25} \left(\frac{x}{L_{LL}} - 0,75\right)$

**Note 1:**  
 $p_{WP}$  : Pressure, in kN/m<sup>2</sup>, at the forward perpendicular, to be taken equal to:  
 • 49,1 + 0,0726 ( $L_{LL} - 100$ ) for type B ships  
 • 49,1 + 0,3560 ( $L_{LL} - 100$ ) for type A, type B-60 or type B-100 ships  
 Type A, type B, type B-60 and type B-100 ships are defined in Ch 1, Sec 3, [2.3]  
 $x$  : Longitudinal coordinate, in m, of the assessed structural member mid-point, measured from the aft end of length  $L$  or  $L_{LL}$ , as applicable.

**3.2.5 Envelope of dynamic pressure on exposed deck**

The envelope of dynamic pressure at any point of an exposed deck  $P_{d-max}$  is to be taken as the greatest pressure value obtained from any of the load cases in accordance with [3.2.3] and [3.2.4].

**3.3 Load carried on exposed deck**

**3.3.1** If loads are carried on an exposed deck, for example containers, cargo or equipment, the static and dynamic pressures due to these loads are to be considered as per Ch 5, Sec 6, [6] and Ch 5, Sec 6, [8].

**4 External impact pressure**

**4.1 Application**

**4.1.1** Impact pressure is only to be applied for strength assessment.

**4.2 Bottom and stern slamming impact pressures**

**4.2.1 Bottom slamming**

The bottom impact pressures  $P_{SLI}$  due to slamming are to be obtained, in kN/m<sup>2</sup>, from the following formula, without being taken less than 0:

$$P_{SLI} = 100 \frac{h_{SL}^2 - (z - T_F)^2}{T_{RZ}^2 \tan \beta}$$

where:

$T_F$  : Minimum draught at the forward perpendicular, in m, among those foreseen in operation in ballast conditions or conditions of partial loading

$h_{SL}$  : Maximum relative wave elevation, in m, to be taken as follows:

- for  $x/L < 0,7$ :  $h_{SL} = 0$
- for  $x/L = 0,7$ :  $h_{SL} = 4 f_R H C_{B-LC}^{-0,7}$
- for  $x/L \geq 0,9$ :  $h_{SL} = f_c 19 f_R H C_{B-LC}^{-0,7}$

For intermediate values of  $x/L$ ,  $h_{SL}$  is to be obtained by linear interpolation

$f_c$  : Correction factor, taken equal to 0,7

$H$  : Wave parameter defined in Ch 5, Sec 3, for a reference length calculated with:

$$\alpha = 0,34 \left( \frac{T_{LC}}{L} \right)^{-0,28}$$

$$f\alpha = 1,0$$

$T_{LC}$  : Draught amidships, in m, at the loading condition where  $T_F$  occurs

$T_{RZ}$  : Mean up crossing period, in s, to be taken as:  $T_{RZ} = 1,2 L^{0,40}$

$\beta$  : Longitudinal or transverse deadrise angle at the calculation point, whichever is the greater, but not to be taken less than 10 deg (see Fig 3).

### 4.2.2 Stern slamming

The stern impact pressures  $P_{SLI}$  due to slamming are to be obtained, in  $kN/m^2$ , from the following formula, without being taken less than 0:

$$P_{SLI} = 100 \frac{h_{SL}^2 - (z - T_{LC})^2}{T_{RZ}^2 \tan \beta}$$

where:

$h_{SL}$  : Maximum relative wave elevation, in m, to be taken as follows:

- for  $x/L = 0$ :  $h_{SL} = 13,7 f_R H C_{B-LC}^{2,5} C_{W-LC}^{-4,9}$
- for  $x/L = 0,2$ :  $h_{SL} = 2,7 f_R H C_{B-LC}^{2,5} C_{W-LC}^{-4,9}$
- for  $x/L > 0,2$ :  $h_{SL} = 0$

For intermediate values of  $x/L$ ,  $h_{SL}$  is to be obtained by linear interpolation.

with:

$C_{B-LC}$  : Block coefficient at considered loading condition draught  $T_{LC}$

$C_{W-LC}$  : Waterplane coefficient at considered loading condition draught  $T_{LC}$

$H$  : Wave parameter defined in Ch 5, Sec 3, for a reference length calculated with:

$$\alpha = 0,86$$

$$f\alpha = 1,0$$

$T_{RZ}$  : Mean up crossing period, in s, to be taken as:  $T_{RZ} = 3 L^{0,26}$

$\beta$  : Longitudinal or transverse deadrise angle at the calculation point, whichever is the greater, but not to be taken less than 10 deg (see Fig 3).

**Figure 3 : Definition of deadrise angle  $\beta$**

**4.3 Bow flare impact pressure**

**4.3.1** The bow flare impact pressure  $P_{FI}$  is to be obtained, in  $\text{kN/m}^2$ , from the following formula:

$$P_{FI} = C_s C_z (0,22 + 0,15 \tan \alpha) (0,4V \sin \beta + 0,6 \sqrt{L})^2$$

where:

- $C_s$  : Coefficient depending on the type of structures on which the bow flare impact pressure is considered to be acting:
  - $C_s = 1,8$  for plating and ordinary stiffeners
  - $C_s = 1,1$  for primary supporting members
- $C_z$  : Coefficient depending on the distance between the draught for the considered loading condition and the calculation point:
  - for  $z \geq 21,5 H + T_{LC} - 11$ :  
 $C_z = 10,75 H - 0,5 (z - T_{LC})$ , not to be taken smaller than 0
  - for  $z < 21,5 H + T_{LC} - 11$ :  
 $C_z = 5,5$
- $H$  : Wave parameter defined in Ch 5, Sec 3, for a reference length calculated with:  
 $\alpha = 0,65 C_{W-LC}^{-1,3}$   
 $f\alpha = 1,0$
- $\alpha$  : Flare angle at the calculation point, defined as the angle between a vertical line and the tangent to the side plating, measured in a vertical plane normal to the horizontal tangent to the shell plating (see Fig 4)
- $\beta$  : Entry angle at the calculation point, defined as the angle between a longitudinal line parallel to the centreline and the tangent to the shell plating in a horizontal plane (see Fig 4).

**Figure 4 : Definition of angles  $\alpha$  and  $\beta$**

**4.4 Berthing impact pressure**

**4.4.1 Application**

The impact pressure induced by the contact of the fenders on the side shell during berthing operations, as defined in [4.4.2], is to be applied to ships having a moulded displacement greater than 8000 t.

It applies to the part of the side shell extending from the ballast draught  $T_{BAL}$  to  $0,25 T_{SC}$  (minimum 2,2 m) above  $T_{SC}$ , in areas where the breadth of the ship is greater than  $0,9 B$ .

**4.4.2** The berthing impact pressure  $P_{BI}$ , in  $\text{kN/m}^2$ , is to be taken as defined in Tab 31.

**Table 31 : Berthing impact pressure**

Ship moulded displacement $\Delta$ at $T_{SC}$ , in t	$P_{BI}$
$8000 < \Delta \leq 50000$	170
$50000 < \Delta \leq 150000$	180
$150000 < \Delta \leq 250000$	190
$250000 < \Delta \leq 400000$	190
$\Delta > 400000$	210

## 5 External pressure on front, side and aft bulkheads of superstructures and deckhouses

### 5.1 Application

5.1.1 External pressure on front, side and aft bulkheads of superstructures and deckhouses is only to be applied for strength assessment.

### 5.2 Definitions

#### 5.2.1 Superstructures

Superstructures are defined in Ch 1, Sec 3.

#### 5.2.2 Deckhouses

Deckhouses are defined in Ch 1, Sec 3.

#### 5.2.3 Tiers of superstructures and deckhouses

Tiers of superstructures and deckhouses are defined in Ch 1, Sec 3, [2.2.10].

The lowest tier is normally that tier which is directly situated above the uppermost continuous deck to which the moulded depth  $D$  is measured. However, when  $(D - T_{SC})$  exceeds the minimum non-corrected tabular freeboard (according to ICLL as amended) by at least one standard superstructure height (as defined in Ch 1, Sec 3, Tab 5), then this tier may be defined as the 2nd tier and the tier above as the 3rd tier.

### 5.3 Superstructures side bulkheads

#### 5.3.1 Lateral pressure

The lateral pressure is to be obtained as defined in Article [1].

When the side is a tank boundary, the internal lateral pressure, as defined in Ch 5, Sec 6, is also to be considered.

### 5.4 Deckhouses side and end bulkheads and superstructures end bulkheads

#### 5.4.1 Lateral pressure

The lateral pressure to be used for the determination of scantlings of front, side and aft bulkheads of deckhouses and of front and aft bulkheads of superstructures is to be obtained, in  $\text{kN/m}^2$ , from the following formula:

$$P_{sd} = 10 n_D a c [b f - (z - T_{SC})]$$

to be taken not less than  $P_{sd-\min}$

where:

$n_D$  : Navigation coefficient as defined in Tab 32

$a$  : Coefficient defined in Tab 33

$c$  : Coefficient taken equal to:

$$c = 0,3 + 0,7 \frac{b_1}{B_1}$$

For exposed parts of machinery casings,  $c$  is to be taken equal to 1,0

$b_1$  : Breadth of the superstructure or deckhouse, in m, at the position considered, to be taken not less than 0,25  $B_1$

$B_1$  : Actual maximum breadth of the ship at the exposed weather deck level, in m, at the position considered

$b$  : Coefficient defined in Tab 35

$f$  : Coefficient defined in Tab 34

$P_{sd-\min}$  : Minimum lateral pressure, in  $\text{kN/m}^2$ , defined in Tab 36.

**Table 32 : Navigation coefficient**

Navigation notation	Navigation coefficient $n_D$
<b>unrestricted navigation</b>	1,00
<b>summer zone</b>	0,90
<b>tropical zone</b>	0,80
<b>coastal area</b>	0,80
<b>sheltered area</b>	0,50

**Note 1:** Where specific designation of the geographical area and/or the most unfavorable sea conditions considered are added to the navigation notation as per Pt A, Ch 1, Sec 2, [5.2.6], the value of  $n_D$  for **unrestricted navigation** is to be used unless a specific assessment has been performed by the Society based on the scatter diagram corresponding to the geographical area or the sea conditions considered

**Table 33 : Coefficient a - Lateral pressure for superstructures and deckhouses**

Type of bulkhead	Location	Coefficient a	Maximum value of a
Unprotected front (2)	Lowest tier	$2 + \frac{L}{120}$	4,5
	Second tier	$1 + \frac{L}{120}$	3,5
	Third tier	$0,5 + \frac{L}{150}$	2,5
	Fourth tier	$0,9 \left( 0,5 + \frac{L}{150} \right)$	2,25
	Fifth tier and above	$0,8 \left( 0,5 + \frac{L}{150} \right)$	2,0
Protected front (2)	Lowest, second and third tiers	$0,5 + \frac{L}{150}$	2,5
	Fourth tier	$0,9 \left( 0,5 + \frac{L}{150} \right)$	2,25
	Fifth tier and above	$0,8 \left( 0,5 + \frac{L}{150} \right)$	2,0
Side (1)	Lowest, second and third tiers	$0,5 + \frac{L}{150}$	2,5
	Fourth tier	$0,9 \left( 0,5 + \frac{L}{150} \right)$	2,25
	Fifth tier and above	$0,8 \left( 0,5 + \frac{L}{150} \right)$	2,0
Aft end	All tiers, when $x/L \leq 0,5$	$0,7 + \frac{L}{1000} - 0,8 \frac{x}{L}$	$1 - 0,8 \frac{x}{L}$
	All tiers, when $x/L > 0,5$	$0,5 + \frac{L}{1000} - 0,4 \frac{x}{L}$	$0,8 - 0,4 \frac{x}{L}$

(1) Applicable only to deckhouses side bulkheads

(2) The front bulkhead of a superstructure or deckhouse may be considered as protected when it is located less than  $B_x$  behind another superstructure or deckhouse, and the width of the front bulkhead being considered is less than the width of the aft bulkhead of the superstructure or deckhouse forward of it.  $B_x$  is the local breadth of the ship at the front bulkhead.

**Table 34 : Coefficient f - Lateral pressure for superstructures and deckhouses**

Ship length	Coefficient f
$L < 150$	$\frac{L}{10} e^{-L/300} - \left[ 1 - \left( \frac{L}{150} \right)^2 \right]$
$150 \leq L < 300$	$\frac{L}{10} e^{-L/300}$
$L \geq 300$	11,03

**Table 35 : Coefficient b - Lateral pressure for superstructures and deckhouses**

Location of bulkhead (1)	Coefficient b
$\frac{x}{L} \leq 0,45$	$1 + \left( \frac{\frac{x}{L} - 0,45}{C_B + 0,2} \right)^2$
$\frac{x}{L} > 0,45$	$1 + 1,5 \left( \frac{\frac{x}{L} - 0,45}{C_B + 0,2} \right)^2$

(1) For deckhouse sides, the deckhouse is to be subdivided into parts of approximately equal length, not exceeding 0,15 L each, and x is to be taken as the co-ordinate of the centre of each part considered.

**Note 1:**

$C_B$  : Block coefficient, with  $0,6 \leq C_B \leq 0,8$

**Table 36 : Minimum lateral pressure  $P_{sd-min}$  for superstructures and deckhouses**

Location and type of bulkhead	$P_{sd-min}$ in kN/m <sup>2</sup>
Lowest tier of unprotected fronts	$30 \leq 25,0 + 0,10L \leq 50$
Elsewhere:	
• if $z \leq T_{SC} + 0,5 B A_R + 0,5 h_w$	$15 \leq 12,5 + 0,05L \leq 25$
• if $T_{SC} + 0,5 B A_R + 0,5 h_w < z$ and $z \leq T_{SC} + 0,5 B A_R + h_w$	linear interpolation
• if $z > T_{SC} + 0,5 B A_R + h_w$	2,5

**Note 1:**

$A_R$  : Roll amplitude for the full load condition, in rad, taken as:

$$A_R = \theta \cdot \frac{\pi}{180}$$

$h_w$  : Relative wave elevation for the full load condition, in m, at the waterline:

- for  $y \geq 0$ , calculated on portside of BR1-P
- for  $y < 0$ , calculated on starboard side of BR1-S

## 6 External pressures on hatch covers and coamings

### 6.1 Application

6.1.1 The external pressures on hatch covers and coamings are to be applied for strength assessment only.

### 6.2 Green sea loads

#### 6.2.1 Vertical weather design load

The pressure  $p_w$ , in kN/m<sup>2</sup>, on the hatch cover panels is to be taken as  $P_{w,d-min}$  defined in [3.2.3] and Tab 30.

**6.2.2 Horizontal weather design load**

The horizontal weather design load  $p_A$ , in  $\text{kN/m}^2$ , for determining the scantlings of outer edge girders (skirt plates) of weather deck hatch covers and of hatch coamings is not to be taken less than the greater of:

- the minimum values  $p_{Amin}$  given in Tab 37
- $p_A = 10 a c (b c_L f - z)$

where:

- a : Coefficient defined in Tab 38
- c : Coefficient taken equal to  $0,3 + 0,7 b'/B_1$   
with  $b'/B_1$  to be taken not less than 0,25
- b' : Breadth of coaming, in m, at the position considered
- $B_1$  : Actual maximum breadth of ship, in m, on the exposed weather deck at the position considered
- b : Coefficient taken equal to:

- for  $x'/L < 0,45$ :

$$b = 1,0 + \left( \frac{\frac{x'}{L} - 0,45}{C_B + 0,2} \right)^2$$

- for  $x'/L \geq 0,45$ :

$$b = 1,0 + 1,5 \left( \frac{\frac{x'}{L} - 0,45}{C_B + 0,2} \right)^2$$

with  $0,6 \leq C_B \leq 0,8$ . When determining scantlings of aft ends of coamings and aft hatch cover skirt plates forward of amidships,  $C_B$  need not be taken less than 0,8

- $c_L$  : Coefficient taken equal to:

$$c_L = \sqrt{\frac{L}{90}} \text{ for } L < 90\text{m}$$

$$c_L = 1 \text{ for } L \geq 90\text{m}$$

- $x'$  : Distance, in m, between the transverse coaming or the hatch cover skirt plate considered and aft end of the length L. When determining side coamings or side hatch cover skirt plates, the side is to be subdivided into parts of approximately equal length, not exceeding 0,15 L each, and  $x'$  is to be taken as the distance between aft end of the length L and the centre of each part considered

- f : Wave parameter, taken equal to:

$$f = \frac{L}{25} + 4,1 \text{ for } L < 90\text{m}$$

$$f = 10,75 - \left( \frac{300 - L}{100} \right)^{1,5} \text{ for } 90\text{m} \leq L < 300\text{m}$$

$$f = 10,75 \text{ for } 300\text{m} \leq L \leq 350\text{m}$$

$$f = 10,75 - \left( \frac{L - 350}{150} \right)^{1,5} \text{ for } L > 350\text{m}$$

- z : Vertical distance, in m, from the summer load line to the midpoint of the stiffener span or to the middle of the plate field.

Note 1: The horizontal weather design load need not be included in the direct strength calculation of the hatch cover, unless it is utilised for the design of substructures of horizontal support according to Ch 11, Sec 9, [8.7].

**Table 37 : Minimum design load  $p_{Amin}$**

		Ship length L		
		L ≤ 50	50 < L < 250	L ≥ 250
$p_{Amin}$ , in $\text{kN/m}^2$	For unprotected fronts	30	25 + L/10	50
	Elsewhere	15	12,5 + L/20	25

**Table 38 : Coefficient a Horizontal weather design load for hatch covers and coamings**

Location	Coefficient a	Maximum value of a
Unprotected front coamings and hatch cover skirt plates	$2 + \frac{L}{120}$	4,5
Unprotected front coamings and hatch cover skirt plates, where the distance from the actual freeboard deck to the summer load line exceeds the minimum non-corrected tabular freeboard according to ICLL by at least one standard superstructure height $h_s$ , as defined in Ch 1, Sec 3, [2.2.9]	$1 + \frac{L}{120}$	3,5
Side and protected front coamings and hatch cover skirt plates	$0,5 + \frac{L}{150}$	2,5
Aft ends of coamings and aft hatch cover skirt plates abaft amidships	$0,7 + \frac{L}{1000} - 0,8 \frac{x}{L}$	$1 - 0,8 \frac{x}{L}$
Aft ends of coamings and aft hatch cover skirt plates forward of amidships	$0,5 + \frac{L}{1000} - 0,4 \frac{x}{L}$	$0,8 - 0,4 \frac{x}{L}$

## 7 External pressure on shell doors

### 7.1 Bow doors

#### 7.1.1 Design external pressure

The design external pressure to be considered for the scantlings of primary supporting members and securing and supporting devices of bow doors is to be not less than that obtained, in kN/m<sup>2</sup>, from the following formula:

$$p_E = 0,5 n_D C_L C_Z (0,22 + 0,15 \tan \alpha) (0,4V \sin \beta + 0,6 \sqrt{L_1})^2$$

where:

$n_D$  : Navigation coefficient, defined in Tab 39

$C_L$  : Coefficient depending on the ship's length:

$$C_L = 0,0125L \text{ for } L < 80\text{m}$$

$$C_L = 1,0 \text{ for } L \geq 80\text{m}$$

$L_1$  : Length as defined in Ch 1, Sec 3

$V$  : Maximum ahead service speed, in knots

$C_Z$  : Coefficient defined in [4.3.1], to be taken equal to 5,5

$\alpha$  : Flare angle at the calculation point, defined as the angle between a vertical line and the tangent to the side plating, measured in a vertical plane normal to the horizontal tangent to the shell plating (see Fig 5)

$\beta$  : Entry angle at the calculation point, defined as the angle between a longitudinal line parallel to the centreline and the tangent to the shell plating in a horizontal plane (see Fig 5).

#### 7.1.2 Design external forces

The design external forces  $F_X$ ,  $F_Y$ ,  $F_Z$  to be considered for the scantlings of securing and supporting devices of bow doors are to be not less than those obtained, in kN, from the following formulae:

$$F_X = p_E A_X$$

$$F_Y = p_E A_Y$$

$$F_Z = p_E A_Z$$

where:

$p_E$  : External pressure, in kN/m<sup>2</sup>, to be calculated according to [7.1.1], assuming the angles  $\alpha$  and  $\beta$  measured at the point on the bow door located  $\ell/2$  aft of the stem line on the plane  $h/2$  above the bottom of the door, as shown in Fig 5

$h$  : Height, in m, to be taken as the lesser of  $h_1$  and  $h_2$

$h_1$  : Height, in m, of the door between the levels of its bottom and the upper deck

$h_2$  : Height, in m, of the door between its bottom and top

$\ell$  : Length, in m, of the door at a height  $h/2$  above the bottom of the door

$A_X$  : Area, in m<sup>2</sup>, of the transverse vertical projection of the door between the levels of the bottom of the door and the top of the upper deck bulwark or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is lesser. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded

Figure 5 : Definition of angles  $\alpha$  and  $\beta$

Table 39 : Navigation coefficient

Navigation notation	Navigation coefficient $n_D$
unrestricted navigation	1,00
coastal area	0,80
sheltered area	0,50

**Note 1:** Where specific designation of the geographical area and/or the most unfavorable sea conditions considered are added to the navigation notation as per Pt A, Ch 1, Sec 2, [5.2.6], the value of  $n_D$  for **unrestricted navigation** is to be used unless a specific assessment has been performed by the Society based on the scatter diagram corresponding to the geographical area or the sea conditions considered

- $A_y$  : Area, in  $m^2$ , of the longitudinal vertical projection of the door between the levels of the bottom of the door and the top of the upper deck bulwark or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is lesser. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser
- $A_z$  : Area, in  $m^2$ , of the horizontal projection of the door between the bottom of the door and the top of the upper deck bulwark or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is lesser. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser.

For bow doors, including bulwark, of unusual form or proportions, e.g. ships with a rounded nose and large stem angles, the areas and angles used for determination of the design values of external forces will be considered on a case by case basis.

### 7.1.3 Closing moment

For visor doors, the closing moment under external loads is to be obtained, in kN.m, from the following formula:

$$M_y = F_x a + 10 W c - F_z b$$

where:

- $W$  : Mass of the visor door, in t
- $a$  : Vertical distance, in m, from visor pivot to the centroid of the transverse vertical projected area of the visor door, as shown in Fig 6
- $b$  : Horizontal distance, in m, from visor pivot to the centroid of the horizontal projected area of the visor door, as shown in Fig 6
- $c$  : Horizontal distance, in m, from visor pivot to the centre of gravity of visor mass, as shown in Fig 6.

7.1.4 Forces acting on the lifting arms

The lifting arms of a visor door and its supports are to be dimensioned for the static and dynamic forces applied during the lifting and lowering operations, and a minimum wind pressure of 1,5 kN/m<sup>2</sup> is to be taken into account.

7.2 Side and stern doors

7.2.1 Design forces in intact ship conditions

The design external forces  $F_E$  and the design internal forces  $F_I$  to be considered for the scantlings of primary supporting members and securing and supporting devices of side doors and stern doors are to be obtained, in kN, from the formulae in Tab 40.

Table 40 : Design forces for side and stern doors

Structural elements	External force $F_E$ , in kN	Internal force $F_I$ , in kN
Securing and supporting devices of doors opening inwards	$A p_E + F_P$	$F_0 + 10 W$
Securing and supporting devices of doors opening outwards	$A p_E$	$F_0 + 10 W + F_P$
Primary supporting members (1)	$A p_E$	$F_0 + 10 W$
<p>(1) The design force to be considered for the scantlings of the primary supporting members is the greater of <math>F_E</math> and <math>F_I</math>.</p> <p><b>Note 1:</b></p> <p>A : Area, in m<sup>2</sup>, of the door opening</p> <p>W : Mass of the door, in t</p> <p><math>F_P</math> : Total packing force, in kN; the packing line pressure is normally to be taken not less than 5 N/mm</p> <p><math>F_0</math> : The greater of <math>F_C</math> and 5 A, in kN</p> <p><math>F_C</math> : Accidental force, in kN, due to loose cargoes etc., to be uniformly distributed over the area A and to be taken not less than 300 kN. For small doors such as bunker doors and pilot doors, the value of <math>F_C</math> may be appropriately reduced. However, the value of <math>F_C</math> may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental forces due to loose cargoes.</p> <p><math>p_E</math> : External design pressure determined at the centre of gravity of the door opening and to be taken not less than that obtained, in kN/m<sup>2</sup>, from the following formulae:</p> $p_E = 10 (T - Z_G) + 25 \quad \text{for } Z_G < T$ $p_E = 25 \quad \text{for } Z_G \geq T$ <p>Moreover, for stern doors of ships fitted with bow doors, <math>p_E</math> is to be taken not less than that obtained, in kN/m<sup>2</sup>, from the following formula:</p> $p_E = 0,6 n_D C_L (0,8 + 0,6 \sqrt{L_1})^2$ <p>T : Draught, in m, at the highest subdivision load line</p> <p><math>Z_G</math> : Height of the centre of the area of the door, in m, above the baseline</p> <p><math>n_D</math> : Navigation coefficient, defined in Tab 39</p> <p><math>C_L</math> : Coefficient depending on the ship's length:</p> $C_L = 0,0125 L \quad \text{for } L < 80 \text{m}$ $C_L = 1,0 \quad \text{for } L \geq 80 \text{m}$ <p><math>L_1</math> : Length as defined in Ch 1, Sec 3</p>		

**7.2.2 Design pressure in damaged ship conditions**

In damaged ship conditions, where doors are located partly or totally below the deepest equilibrium waterline, the following external design pressures, in kN/m<sup>2</sup>, are to be considered:

- points at or below the deepest equilibrium waterline:

$$p_E = \rho g d_F$$

- points above the deepest equilibrium waterline:

$$p_E = 0$$

where:

$d_F$  : Distance, in m, from the calculation point to the deepest equilibrium waterline in the damaged condition at y or from the calculation point to the bulkhead deck at side, whichever is the greater.

The deepest equilibrium waterlines are to be provided by the Designer under his own responsibility.

**8 External loads on containers**

**8.1 Wind forces**

**8.1.1** The forces due to the effect of the wind, applied to one container stowed above deck at tier "i", are to be obtained, in kN, from the following formulae:

- in x direction:

$$F_{x,wind,i} = \frac{1}{2} \rho_a \left[ V_w \left( \frac{z_i - T_{LC}}{10} \right)^{\alpha-2} \right] h_c b_c 10^{-3}$$

- in y direction:

$$F_{y,wind,i} = \frac{1}{2} \rho_a \left[ V_w \left( \frac{z_i - T_{LC}}{10} \right)^{\alpha-2} \right] h_c \ell_c 10^{-3}$$

where:

$\rho_a$  : Air density, to be taken equal to 1,225 kg/m<sup>3</sup>

$V_w$  : Wind speed at 10 m above waterline, to be taken equal to:

- for ships assigned the additional class notation **LASHING** or **LASHING-RSSA**( ): as defined in Pt F, Ch 12, Sec 5, [4.5]
- for other cases:  $V_w = 35$  m/s

$\alpha$  : Coefficient for water surface roughness, to be taken equal to:

$$\alpha = 0,11$$

$z_i$  : Z coordinate, in m, of the volumetric center of the container at tier " i " with respect to the coordinate system defined in Ch 1, Sec 3, [2.6]

$h_c$  : Height, in m, of a container

$\ell_c, b_c$  : Dimensions, in m, of the container stack in the ship longitudinal and transverse directions, respectively.

These forces only act on a stack exposed to wind. In the case of M juxtaposed and connected stacks of the same height, the wind forces are to be distributed over the M stacks.

In the case of juxtaposed and connected stacks of different heights, the wind forces are to be distributed taking into account the number of stacks at the tier considered (see example on Fig 7).

**Figure 7 : Distribution of wind forces in the case of connected stacks**

## Section 6 Internal Loads and cargo loads

### Symbols

For symbols not defined in this Section, refer to Ch 1, Sec 3.

- $a_x, a_y, a_z$ : Longitudinal, transverse and vertical accelerations, in  $m/s^2$ , calculated at the centre of gravity of the considered compartment,  $x_C, y_C, z_C$ , as defined in Ch 5, Sec 3, [3.2]
- $b_C$ : Transverse distance, in m, between longitudinal watertight bulkheads or longitudinal wash bulkheads, if any, or between a longitudinal watertight bulkhead and the adjacent longitudinal wash bulkhead
- $B_H$ : Breadth of the cargo hold, in m, measured at mid-length of the cargo hold and at the mid height between the top of hopper tank and the bottom of topside tank, see Fig 4
- $B_B$ : Breadth of inner bottom, in m, measured at mid-length of the cargo hold, see Fig 4
- $D_1$ : Distance, in m, from the base line to the freeboard deck at side amidships
- $d_F$ : Filling level of a tank, in m, to be taken as the vertical distance measured with the ship at rest, from the lowest point of the tank to the free surface of the liquid
- $d_{sc}$ : Diameter, in m, of a steel coil
- $f_\beta$ : Heading correction factor defined in Ch 5, Sec 3
- $h_{air}$ : Height of air pipe or overflow pipe above the top of the tank, in m
- $h_{BC}$ : Height of bulk cargo, in m, from the inner bottom to the upper surface of bulk cargo, as defined in [3.3.1] or [3.3.2]
- $h_{DB}$ : Height, in m, of the double bottom at the centreline, measured at mid-length of the cargo hold, see Fig 4
- $h_{HPL}$ : Vertical distance, in m, from the inner bottom at centreline to the upper intersection of hopper tank and side shell or inner side for double side bulk carriers, determined at mid length of the considered cargo hold, as shown in Fig 4  
 $h_{HPL} = 0$  if there is no hopper tank.
- $h_{HPU}$ : Vertical distance, in m, from the inner bottom at centreline to the lower intersection of topside tank and side shell or inner side for double side bulk carriers, determined at mid length of the cargo hold at midship, as shown in Fig 4
- $h_{LS}$ : Mean height, in m, of the lower stool, measured from the inner bottom
- $H$ : Height, in m, of a tank, to be taken as the vertical distance from the bottom to the top of the tank, excluding any small hatchways
- $K_C$ : Coefficient taken equal to:
- for  $\alpha_p \leq 90^\circ$ :  
$$K_C = \cos^2 \alpha_p + (1 - \sin \Psi) \sin^2 \alpha_p$$
  - for  $90^\circ < \alpha_p \leq 120^\circ$ :  
$$K_C = (1 - \sin \Psi) \sin^2 \alpha_p$$
  - for  $\alpha_p > 120^\circ$  and  $\alpha_p + \Psi < 180^\circ$ :  
$$K_C = 0,75 (1 - \sin \Psi) \left[ 1 - \frac{\alpha_p - 120}{60 - \Psi} \right]$$
  - when  $\alpha_p + \Psi \geq 180^\circ$ :  
$$K_C = 0$$
- $l_C$ : Longitudinal distance, in m, between transverse watertight bulkheads or transverse wash bulkheads, if any, or between a transverse watertight bulkhead and the adjacent transverse wash bulkhead
- $l_H$ : Length of the cargo hold, in m, at the centreline between the transverse bulkheads. This is to be measured to the mid-depth of the corrugated bulkhead(s) if fitted
- $l$ : Distance, in m, between floors, see Fig 12
- $l_{lp}$ : Distance, in m, between outermost dunnage per EPP in the ship X direction, see Fig 13
- $l_{st}$ : Length, in m, of a steel coil
- $M$ : Mass, in t, of the bulk cargo being considered
- $M_{Full}$ : Cargo mass, in t, in a cargo hold corresponding to the volume up to the top of the hatch coaming with a density of the greater of:  
 $M_H/V_{Full}$  or  $1,0 \text{ t/m}^3$ .  
 $M_{Full} = 1,0 V_{Full}$  but not less than  $M_H$

- $M_H$  : Cargo mass, in t, in a cargo hold that corresponds to the homogeneously loaded condition at maximum draught with 50% consumables
- $M_{HD}$  : Maximum allowable cargo mass, in t, in a cargo hold according to design loading conditions with specified holds empty at maximum draught with 50% consumables and all ballast water tanks in cargo hold region empty
- $M_{sc-ib}$  : Equivalent mass of a steel coil, in t, on inner bottom, as defined in [5.3.1]
- $M_{sc-hs}$  : Equivalent mass of a steel coil, in t, on hopper side, as defined in [5.3.2]
- $n_1$  : Number of tiers of steel coils
- $n_2$  : Number of load points per EPP of the inner bottom, see [5.1.3]
- $n_3$  : Number of dunnages supporting one row of steel coils
- $P_{drop}$  : Overpressure, in kN/m<sup>2</sup>, due to sustained liquid flow through air pipe or overflow pipe in case of overfilling or filling during flow through ballast water exchange  
 When the total area of tank overflow openings is more than twice the sectional area of the related filling pipe,  $P_{drop}$  may be taken equal to 0  
 Otherwise,  $P_{drop}$  is to be defined by the designer, but not to be taken less than 25 kN/m<sup>2</sup>
- $P_{pv}$  : Design vapour pressure in kN/m<sup>2</sup>.  
 Where a pressure relief valve is fitted,  $P_{pv}$  is to be taken equal to:
- 1,1 times the safety valve setting pressure, in general
  - 1,0 times the safety valve setting pressure in case of liquefied gas cargo tank or liquefied gas fuel tank.
- Where no pressure relief valve is fitted,  $P_{pv}$  is to be taken as 0 kN/m<sup>2</sup>
- perm : Permeability of cargo, to be taken as:  
 perm = 0,3 for iron ore, coal cargoes and cement  
 perm = 0 for steel coils and steel packed products
- R : Vertical coordinate of the ship rotation centre, to be taken as:  

$$R = \min\left(\frac{D}{4} + \frac{T_{LC}}{2}, \frac{D}{2}\right)$$
- $s_{CG}$  : Spacing of corrugations, in m; see Ch 4, Sec 5, Fig 27
- T $\theta$  : Roll period, in s, as defined in Ch 5, Sec 3, [2.1.1]
- $V_{Full}$  : Volume, in m<sup>3</sup>, of cargo hold up to top of the hatch coaming, taken as:  
 $V_{Full} = V_H + V_{HC}$
- $V_H$  : Volume, in m<sup>3</sup>, of cargo hold up to level of the intersection of the main deck with the hatch coaming excluding the volume enclosed by hatch coaming, see Fig 4
- $V_{HC}$  : Volume, in m<sup>3</sup>, of the hatch coaming, from the level of the intersection of the main deck with the hatch side coaming to the top of the hatch coaming, determined for the cargo hold at midship, as shown in Fig 4
- $V_{TS}$  : Total volume, in m<sup>3</sup>, of the portion of the lower bulkhead stools within the cargo hold length  $\ell_H$  and inboard of the hopper tanks, as shown in Fig 4
- W : Mass, in t, of a steel coil
- x, y, z : X, Y and Z coordinates, in m, of the load point with respect to the reference coordinate system defined in Ch 1, Sec 3, [2.6.1]
- $x_C, y_C, z_C$  : X, Y and Z coordinates, in m, of the centre of gravity of the considered compartment, with respect to the reference coordinate system defined in Ch 1, Sec 3, [2.6.1]
- $x_G, y_G, z_G$  : X, Y and Z coordinates, in m, of the volumetric centre of gravity of the tank or fully filled cargo hold, i.e.  $V_{Full}$ , considered with respect to the reference coordinate system defined in Ch 1, Sec 3, [2.6.1].  
 In case of partially filled cargo hold,  $x_G, y_G, z_G$  to be taken as follows:  
 $x_G, y_G$ : Volumetric centre of gravity of the cargo hold  
 $z_G = h_{DB} + h_{BC-CL} / 2$   
 $h_{BC-CL}$  is the height of cargo at the centreline, as defined in [3.3.2]
- $z_{BC}$  : Height of the upper surface of the cargo above the baseline in way of the load point, in m, as defined in [3.3.1] and [3.3.2] to be taken as:  
 $z_{BC} = h_{DB} + h_{BC}$
- $z_{top}$  : Z coordinate of the highest point of tank, excluding small hatchways, in m
- $z_{min}$  : Z coordinate of the lowest point of tank, in m
- $\alpha_p$  : Angle, in deg, between panel considered and the horizontal plane. The angle is to be measured inward and upward from horizontal plane outside cargo hold, between 0 and 180 deg, as shown in Fig 1.
- $\theta$  : Roll angle, in deg, defined in Ch 5, Sec 3, [2.1.1]

$\theta_h$  : Angle, in deg, between inner bottom plate and hopper sloping plate or inner hull, as shown in Fig 4. In general  $\theta_h$  is such that:

$$\tan \theta_h = \frac{2h_{HPL}}{B_H - B_{IB}}$$

$\rho_L$  : Density of liquid, in t/m<sup>3</sup>, typically:

- 1,025 for ballast water
- 1,0 for fresh water
- 0,5 for liquefied natural gas

$\rho_c$  : Density of bulk cargo, in t/m<sup>3</sup>, as defined in [3.3.3]

$\rho_{ST}$  : Density of steel, in t/m<sup>3</sup>, to be taken as 7,85

$\varphi$  : Pitch angle, in deg, defined in Ch 5, Sec 3, [2.1.2]

$\psi$  : Assumed angle of repose, in deg, of bulk cargo (considered drained and removed); to be taken as:

- $\psi = 30^\circ$  in general
- $\psi = 35^\circ$  for iron ore
- $\psi = 25^\circ$  for cement.

## 1 Pressures due to liquids

### 1.1 Application

#### 1.1.1 Pressures for the strength and fatigue assessments in intact conditions

The internal pressure  $P_{in}$  due to liquid acting on any load point of a tank boundary, in kN/m<sup>2</sup>, for the static design load scenarios given in Ch 5, Sec 7, is to be taken as:

$$P_{in} = P_{ls}$$

The internal pressure  $P_{in}$  due to liquid acting on any load point of a tank boundary, in kN/m<sup>2</sup>, for the static + dynamic design load scenarios is to be derived for each dynamic load case and is to be taken as:

$$P_{in} = P_{ls} + P_{ld} \text{ without being taken less than } 0$$

where:

$P_{ls}$  : Static pressure due to liquid in tank, in kN/m<sup>2</sup>, as defined in [1.2]

$P_{ld}$  : Dynamic pressure due to liquid in tank, in kN/m<sup>2</sup>, as defined in [1.3].

#### 1.1.2 Pressures for the strength assessment in flooded conditions

The internal pressure  $P_{in}$  in flooded condition, in kN/m<sup>2</sup>, acting on any load point of the structural watertight boundaries intended to stop vertical and horizontal flooding, for the flooded static design load scenarios given in Ch 5, Sec 7, is to be taken as:

$$P_{in} = P_{fs}$$

where:

$P_{fs}$  : Static pressure of seawater in flooded condition in the compartment, in kN/m<sup>2</sup>, as defined in [1.4].

For corrugations of vertically corrugated transverse bulkheads separating cargo holds of ships intended for the carriage of dry cargoes in bulk, the flooded pressures and forces specified in [4.1] for bulk cargoes in flooded conditions are to be applied.

For double bottom in cargo holds of ships intended for the carriage of dry cargoes in bulk, the flooded pressures and forces specified in [4.2] for bulk cargoes in flooded conditions are to be applied.

## 1.2 Static liquid pressure in intact conditions

### 1.2.1 Normal operations at sea and harbour/sheltered water operations

The static pressure  $P_{ls}$  due to liquid in tanks during normal operations at sea and harbour/sheltered water operations, in  $\text{kN/m}^2$ , is to be taken as:

$$P_{ls} = \rho_L g (z_{top} - z) + P_{pv}$$

### 1.2.2 Sequential ballast water exchange

The static pressure  $P_{ls}$  due to liquid in ballast tanks associated with ballast water exchange operations by sequential method is to be taken as defined for normal operations at sea in [1.2.1].

### 1.2.3 Flow through ballast water exchange

The static pressure  $P_{ls}$  due to liquid in ballast tanks associated with flow through ballast water exchange operations, in  $\text{kN/m}^2$ , is to be taken as:

$$P_{ls} = \rho_L g (z_{top} - z + h_{air}) + P_{drop}$$

### 1.2.4 Ballast water exchange by dilution

The static pressure  $P_{ls}$  due to liquid in ballast tanks associated with ballasting operations by means of dilution is to be taken as defined for sequential ballast exchange in [1.2.2].

The ship designer has to inform the Society if the ballast water exchange system implies additional pressure to be considered such as  $P_{drop}$  in addition to the pressure defined in [1.2.2].

### 1.2.5 Ballasting using ballast water treatment system

The static pressure  $P_{ls}$  due to liquid in ballast tanks associated with ballasting operations using a ballast water treatment system is to be taken as defined for sequential ballast exchange in [1.2.2]. The ship designer has to inform the Society if the ballast water treatment system implies additional pressure to be considered such as  $P_{drop}$ , in addition to the pressure defined in [1.2.2].

### 1.2.6 Static liquid pressure for the fatigue assessment

The static pressure  $P_{ls}$  due to liquid in tanks to be used for the fatigue assessment, in  $\text{kN/m}^2$ , is to be taken as follows, depending on their filling level defined in Ch 10, Sec 1, [2.1.1]:

- fully filled tanks:

$$P_{ls} = \rho_L g (z_{top} - z)$$

- consumable tanks filled at 50%:

$$P_{ls} = \rho_L g (0,5 (z_{min} + z_{top}) - z) \text{ without being taken less than } 0.$$

## 1.3 Dynamic liquid pressure in intact conditions

### 1.3.1 Dynamic pressure on watertight bulkheads

The dynamic pressure  $P_{ld}$  due to liquid in tanks, in  $\text{kN/m}^2$ , is to be taken as:

$$P_{ld} = \rho_L [a_x (x_0 - x) + a_y (y_0 - y) + a_z (z_0 - z)]$$

where:

$x_0$  : X coordinate, in m, of the reference point.

$y_0$  : Y coordinate, in m, of the reference point.

$z_0$  : Z coordinate, in m, of the reference point.

The reference point is to be taken as the point with the highest value of  $V_j$ , calculated for all the points that define the upper boundary of the tank, as follows:

$$V_j = a_x (x_j - x_c) + a_y (y_j - y_c) + (a_z + g) (z_j - z_c)$$

where:

$x_j$  : X coordinate, in m, of the point j on the upper boundary of the tank

$y_j$  : Y coordinate, in m, of the point j on the upper boundary of the tank

$z_j$  : Z coordinate, in m, of the point j on the upper boundary of the tank.

### 1.3.2 Dynamic pressure in consumable tanks for the fatigue assessment

The dynamic pressure  $P_{ld}$ , in  $\text{kN/m}^2$ , due to liquid in consumable tanks filled at 50% according to Ch 10, Sec 1, [2.1.1], is to be taken as follows:

- as calculated in [1.3.1] for  $z \leq 0,5 z_{top}$
- equal to 0 for  $z > 0,5 z_{top}$

## 1.4 Static pressure in flooded conditions

### 1.4.1 Ships for which damage stability calculations are required

The static pressure  $P_{fs}$ , in  $\text{kN/m}^2$ , acting on structural watertight elements defined as per the Internal Watertight Plan and located below the deepest equilibrium waterline (excluding side shell structural elements) which constitute boundaries intended to stop vertical and horizontal flooding, is to be taken as:

$$P_{fs} = \rho g d_{FL} \text{ without being taken less than } 0$$

where:

$d_{FL}$  : Distance, in m, from the calculation point to the deepest equilibrium waterline in the damaged condition at y or from the calculation point to the bulkhead deck at side, whichever is the greater.

The deepest equilibrium waterlines are to be provided by the Designer under his own responsibility.

### 1.4.2 Ships for which damage stability calculations are not required

The static pressure  $P_{fs}$ , in  $\text{kN/m}^2$ , acting on structural watertight elements (excluding side shell structural elements) which constitute boundaries intended to stop vertical and horizontal flooding, is to be obtained from the formula in [1.4.1], where  $d_f$  is the vertical distance, in m, from the calculation point to the bulkhead deck at side.

## 2 Partly filled tanks intended for the carriage of liquid or ballast

### 2.1 Application

#### 2.1.1 General

Sloshing assessment is to be carried for all liquid cargo, ballast and other liquid tanks with volume exceeding  $100\text{m}^3$ , if required by Ch 11, Sec 4, [1.5].

Sloshing assessment is to be carried out for all liquefied gas tanks for which partial filling is contemplated, whatever their volume.

#### 2.1.2 Membrane tanks

Sloshing pressure in membrane tanks of ships having the service notation **liquefied gas carrier** is defined in Pt D, Ch 9, App 1, [2].

Sloshing pressure in membrane tanks of ships having the additional service feature **LNGfuel** is defined in Pt D, Ch 9, App 1, [2] as per NR529 C6.4.9.4.1.3.

### 2.2 Pressure definition

#### 2.2.1 Sloshing pressure

The sloshing pressure  $P_{sl}$ , in  $\text{kN/m}^2$ , due to liquid motion in the longitudinal or transverse direction, acting on bulkheads in tanks intended for the carriage of liquid or ballast, is to be taken as:

$$P_{sl} = P_{S-SL} + P_{W-SL}$$

where:

$P_{S-SL}$  : Static pressure, in  $\text{kN/m}^2$ , as defined in [2.3.1]

$P_{W-SL}$  : Dynamic sloshing pressure, in  $\text{kN/m}^2$ , as defined in [2.4.1] or [2.4.2].

The sloshing pressure,  $P_{sl}$  is not to be taken less than  $12 \text{ kN/m}^2$ .

#### 2.2.2 Impact pressure

The impact pressure  $P_{im}$ , in  $\text{kN/m}^2$ , due to liquid motion in the longitudinal or transverse direction, acting on bulkheads in tanks intended for the carriage of liquid or ballast, is to be taken as:

$$P_{im} = P_{S-I} + P_{W-I}$$

where:

$P_{S-I}$  : Static pressure, in  $\text{kN/m}^2$ , as defined in [2.3.2]

$P_{W-I}$  : Dynamic impact pressure, in  $\text{kN/m}^2$ , as defined in [2.5.1].

### 2.3 Static pressure

#### 2.3.1 Static pressure to be used in combination with the dynamic sloshing pressure

The static pressure  $P_{S-SL}$  to be used in combination with the dynamic sloshing pressure defined in [2.4] is to be obtained, in  $\text{kN/m}^2$ , from the following formulae:

- for  $z < d_F + z_{min}$ :  $P_{S-SL} = \rho_L g (d_F + z_{min} - z) + P_{pv}$
- for  $z \geq d_F + z_{min}$ :  $P_{S-SL} = P_{pv}$

**2.3.2 Static pressure to be used in combination with the dynamic impact pressure**

The static pressure  $P_{S-I}$  to be used in combination with the dynamic impact pressure defined in [2.5] is to be obtained, in  $kN/m^2$ , from the following formulae:

- for  $z < 0,7 H + z_{min}$ :  $P_{S-I} = \rho_L g (0,7 H + z_{min} - z) + P_{pv}$
- for  $z \geq 0,7 H + z_{min}$ :  $P_{S-I} = P_{pv}$

**2.4 Dynamic sloshing pressure**

**2.4.1** The sloshing pressure  $P_{W-SL}$  is obtained, in  $kN/m^2$ , from the following formulae (see Fig 2):

$$P_{W-SL} = 0 \quad \text{for } z \leq 0,8d_F + z_{min}$$

$$P_{W-SL} = \left(5 \frac{z - z_{min}}{d_F} - 4\right) \alpha P_0 \quad \text{for } 0,8d_F + z_{min} < z \leq d_F + z_{min}$$

$$P_{W-SL} = \left(6 - 5 \frac{z - z_{min}}{d_F}\right) \alpha P_0 \quad \text{for } d_F + z_{min} < z < 1,2d_F + z_{min}$$

$$P_{W-SL} = 0 \quad \text{for } z \geq 1,2d_F + z_{min}$$

where:

- $P_0$  : Reference pressure defined in Tab 1 for longitudinal and transverse liquid motion.
- $\alpha$  : Coefficient taken equal to (see Fig 3):

$$\alpha = \frac{d_F}{0,6H} \quad \text{for } d_F < 0,6H$$

$$\alpha = 1 \quad \text{for } 0,6H \leq d_F \leq 0,7H$$

$$\alpha = \frac{H - d_F}{0,3H} \quad \text{for } d_F > 0,7H$$

**Figure 2 : Sloshing pressure  $P_{W-SL}$**

**Figure 3 : Coefficient  $\alpha$**

Table 1 : Reference pressure  $P_0$  for calculation of sloshing, and dynamic impact pressure  $P_{W-I}$

Liquid motion direction	Reference pressure $P_0$ , in $\text{kN/m}^2$	Dynamic impact pressure $P_{W-I}$ , in $\text{kN/m}^2$
Longitudinal	$0,84 \phi_P \rho_L g S \ell_C \phi \frac{\pi}{180}$	$\phi_P \rho_L g \ell_C \left(0,9 + \frac{\ell_C}{L}\right) (5 + 0,015L) \phi \frac{\pi}{180}$
Transverse	$1,93 \phi_R \rho_L g b_C \sqrt{B} \left(1 - 0,3 \frac{B}{b_C}\right) \theta \frac{\pi}{180}$	$0,61 \phi_R \rho_L g (0,75B - 8) b_C \theta \frac{\pi}{180}$

**Note 1:**

$\phi_P$  : Coefficient defined as follows:

- $\phi_P = 1,0$  in the case of smooth tanks or tanks with bottom transverses whose height, in m, measured from the tank bottom, is less than  $0,1 H$
- $\phi_P = 0,4$  in the case of tanks with bottom transverses whose height, in m, measured from the tank bottom, is not less than  $0,1 H$

$S$  : Coefficient defined as follows:

- $S = 1 + 0,02 L$  if  $L \leq 200$  m
- $S = 3 + 0,01 L$  if  $L > 200$  m

$\phi_R$  : Coefficient defined as follows:

- if  $b_C / B \leq 0,3$ :  $\phi_R = 0$
- if  $b_C / B > 0,3$ :
  - $\phi_R = 1,0$  in case of smooth tanks or tanks with bottom girders whose height, in m, measured from the tank bottom, is less than  $0,1 H$
  - $\phi_R = 0,4$  in case of tanks with bottom girders whose height, in m, measured from the tank bottom, is not less than  $0,1 H$

#### 2.4.2 Sloshing pressure on tank bottom transverses in the case of longitudinal liquid motion

The sloshing pressure  $P_{W-SL}$  to be considered as acting on tank bottom transverses is obtained, in  $\text{kN/m}^2$ , from the following formula:

$$P_{W-SL} = 0,84 \rho_L g (1,95 - 0,12 n) (z - z_{\min})$$

where:

$n$  : Number of bottom transverses in the tank.

#### 2.5 Dynamic impact pressure

2.5.1 The dynamic impact pressure  $P_{W-I}$  is obtained, in  $\text{kN/m}^2$ , from the formulae defined in Tab 1 for longitudinal and transverse liquid motions.

Where the upper part of a transverse bulkhead or longitudinal bulkhead, inner side or side is sloped, the dynamic impact pressure  $P_{W-I}$  may be multiplied by the coefficient  $\phi$ , to be obtained from the following formula:

$$\phi = 1 - \frac{h_T}{0,3H}$$

without being taken less than 0

where:

$h_T$  : Height, in m, of the sloped part of the transverse or longitudinal bulkhead, inner side or side.

#### 2.6 Alternative methods

2.6.1 The Society may accept that the dynamic impact pressure or dynamic sloshing pressure are evaluated on the basis of dynamic calculation procedures, where deemed necessary in relation to the tank dimensions and the ship characteristics. The calculations are to be submitted to the Society for verification.

### 3 Pressures and forces due to dry bulk cargo

#### 3.1 Application

3.1.1 The pressures and forces due to dry cargo in bulk in a cargo hold are to be determined both for fully and partially filled cargo holds according to [3.4] and [3.5].

#### 3.2 Hold definitions

##### 3.2.1 Geometrical characteristics

The main geometrical elements of a dry bulk cargo hold are given in Fig 4.

Figure 4 : Definition of dry bulk cargo hold parameters

3.2.2 Fully and partially filled cargo holds

The definitions of a fully and partially filled dry bulk cargo holds are as follow:

a) Fully filled hold:

The dry bulk cargo density is such that the cargo hold is filled up to the top of the hatch coaming, as shown in Fig 5.

The upper surface of the cargo and its effective height in the hold  $h_{BC}$  are to be determined in accordance with [3.3.1].

b) Partially filled hold:

The cargo density is such that the cargo hold is not filled up to the top of the hatch coaming, as shown in Fig 6 or Fig 7.

The upper surface of the cargo and its effective height in the hold  $h_{BC}$  are to be determined in accordance with [3.3.2].

3.3 Dry cargo characteristics

3.3.1 Definition of the upper surface of dry bulk cargo for full cargo holds

For a fully filled cargo hold as defined in [3.2.2], including non-prismatic holds, the effective upper surface of the cargo is an equivalent horizontal surface at  $h_{BC}$ , in m, above inner bottom at centreline as shown in Fig 5.

The value of  $h_{BC}$  is to be calculated at mid length of the cargo hold at the midship, is to be kept constant over the cargo hold region area and is determined as follows:

$$h_{BC} = h_{HPU} + h_0$$

where:

$$h_0 = \frac{S_A}{B_H}$$

$$S_A = S_0 + \frac{V_{HC}}{l_H}$$

$S_0$  : Shaded area, in  $m^2$ , above the lower intersection of topside tank and side shell or inner side, as the case may be, and up to the level of the intersection of the main deck with the hatch coaming, determined for the cargo hold at the midship as shown in Fig 5.

Figure 5 : Definition of effective upper surface of cargo for a full cargo hold

**3.3.2 Definition of upper surface of dry bulk cargo for partially filled cargo holds**

For any partially filled cargo hold, as defined in [3.2.2], including non-prismatic holds, the effective upper surface of the cargo is to be made of three parts:

- One central horizontal surface of breadth  $B_H/2$ , in m, at a height  $h_{BC-CL}$  in m, above the inner bottom
- A sloped surface at each side with an angle  $\psi/2$ , in degrees, between the central horizontal surface, and the side shell or inner hull, as shown in Fig 6, or the hopper plating, as shown in Fig 7, as the case may be.

The height of cargo surface  $h_{BC}$  in m, is to be calculated at mid length of the considered cargo hold and is to be taken as constant over the length of the hold as follows:

For  $|y| \leq \frac{B_H}{4}$  ;  $h_{BC} = h_{BC-CL}$

For  $\frac{B_H}{4} < |y| \leq \frac{B_2}{2}$  ;  $h_{BC} = h_{BC-CL} - \left(|y| - \frac{B_H}{4}\right) \tan \frac{\psi}{2}$

For  $|y| > \frac{B_2}{2}$  ;  $h_{BC} = 0$

where:

$h_{BC-CL}$  : Height, in m, of the cargo surface at the centreline, as shown in Fig 6 and Fig 7

$B_2$  : Maximum breadth of the cargo, in m, as shown in Fig 6 and Fig 7

$h_1$  : Height, in m, to be taken as:

$$h_1 = \frac{M}{\rho_C \cdot B_H \ell_H} - \left(\frac{B_H + B_{IB}}{2B_H}\right) h_{HPL} - \frac{3}{16} B_H \tan \frac{\psi}{2} + \frac{V_{TS}}{B_H \ell_H}$$

- For  $h_1 \geq 0$  as shown in Fig 6:

$$h_{BC-CL} = h_{HPL} + h_1 + h_2$$

$$h_2 = \frac{B_H}{4} \tan \frac{\psi}{2}$$

$$B_2 = B_H$$

- For  $h_1 < 0$  as shown in Fig 7

$$h_{BC-CL} = h_{11} + h_{22}$$

$$h_{11} = h_{HPL} \left(\frac{B_2 - B_{IB}}{B_H - B_{IB}}\right)$$

$$h_{22} = \left(\frac{B_2}{2} - \frac{B_H}{4}\right) \tan \frac{\psi}{2}$$

$$B_2 = \sqrt{\frac{\frac{1}{\ell_H} \left(\frac{M}{\rho_C} + V_{TS}\right) + \frac{1}{2} \left(\frac{h_{HPL} \cdot B_{IB}^2}{B_H - B_{IB}}\right) + \frac{B_H^2}{16} \tan^2 \frac{\psi}{2}}{\frac{1}{2} \left[\left(\frac{h_{HPL}}{B_H - B_{IB}}\right) + \frac{1}{2} \tan^2 \frac{\psi}{2}\right]}}$$

**Figure 6 : Definition of the effective upper surface of cargo for a partially filled cargo hold when  $h_1 \geq 0$**

Figure 7 : Definition of the effective upper surface of cargo for a partially filled cargo hold when  $h_1 < 0$

**3.3.3 Mass and density**

The dry cargo mass and the density are to be taken as specified in Tab 2.

**3.3.4 FE application**

The following process is to be applied for the bulk cargo pressure loads used in FE analysis:

- a) Determine  $h_{BC}$  according to [3.3.1] for fully filled cargo hold or [3.3.2] for partially filled cargo hold.
- b) Determine the corresponding static pressure as defined in [3.4.2] and static shear pressure as defined in [3.5.2] using  $\rho_c$  and apply them in the FE model.
- c) Calculate the actual mass of cargo,  $M_{actual}$ , in t.
- d) Determine the effective cargo density, in  $t/m^3$ :

$$\rho_{eff} = \frac{M}{M_{actual}} \rho_c$$

- e) Calculate the final pressure distribution and shear load using  $\rho_{eff}$  instead of  $\rho_c$ .

**Table 2 : Dry bulk cargo mass (M) and density ( $\rho_c$ )**

	Homogeneous loading condition		Alternate loading condition (3)	
	Fully filled hold	Partially filled hold (1)	Fully filled hold	Partially filled hold
